CIRCULAR LETTER No. 314-01-1491c dated 28.12.2020

Re:

amendments to the Rules for the Classification and Construction of Sea-Going Ships considering experience in application of the Rules

Item(s) of supervision:

ships under construction

Entry-into-force date: 01.02.2021

Valid till:

Validity period extended till:

Cancels / amends / adds Circular Letter No. dated

Number of pages: 1 + 41

Appendices:

Appendix 1: information on amendments introduced by the Circular Letter

Appendix 2: text of amendments to Part XVI "Structure and Strength of Fiber-Reinforced Plastic Ships"

Director General Konstantin G. Palnikov

Text of CL:

We hereby inform that the Rules for the Classification and Construction of Sea-Going Ships shall be amended after re-publication in 2021 as specified in the Appendices to the Circular Letter.

It is necessary to do the following:

1. Bring the content of the Circular Letter to the notice of the RS surveyors, interested organizations and persons in the area of the RS Branch Offices' activity.

2. Apply the provisions of the Circular Letter during review and approval of the technical documentation on ships contracted for construction or conversion on or after 01.02.2021, in the absence of a contract, the keels of which are laid or which are at a similar stage of construction on or after 01.02.2021, as well as during review and approval of the technical documentation on ships, the delivery of which is on or after 01.02.2021.

List of the amended and/or introduced paras/chapters/sections:

Section 2: paras 2.2.1, 2.2.4, Tables 2.1 — 2.5;
Section 3: Figures 3.1 — 3.31, para 3.2.6.2.2, Figure 3.32, para 3.2.6.2.4, Figure 3.33, paras 3.2.6.2.5, 3.2.6.3.2, Figure 3.34, para 3.2.6.3.4, Figures 3.35 — 3.39, para 3.2.6.3.9, Figures 3.40 — 3.54;
Section 4: Figure 4;
Section 5: Tables 5.1 and 5.2, Figures 5.1 and 5.2;
Appendix 1: Figure 1, para 1.1, Figure 2, Table 1, paras 2.1 and 2.2, Section 3, paras 4.1 — 4.3, Figures 4 — 6, Table 4, paras 5.1 — 5.3, Tables 5 and 6, Figures 7 and 8, Section 6, Table 7, Section 7, Table 8, paras 8.1 and 8.2, Figures 9 — 24, paras 8.3 and 8.4, Figures 25 — 29, paras 9.1 — 9.3, Figures 30 — 35

Person in charge: Sergey M. Kordonets 314 +7 812 3128572

PART XVI. STRUCTURE AND STRENGTH OF FIBER-REINFORCED PLASTIC SHIPS

2 MATERIALS

1. Para 2.2.1 is replaced by the following text:

"2.2.1 FRP intended for manufacture of hulls or ship structures, as well as binders for manufacture of FRPs and cores shall be approved by the Register (provided with Type Approval Certificate (CTO) and/or Register Certificate per batch) in accordance with Part I “General Regulations for Technical Supervision” of the Rules for Technical Supervision during Construction of Ships and Manufacture of Materials and Products for Ships. The Register Certificate for FRP is not required provided the requirements specified in 2.2.4.3 of this Part of the Rules are met. Application of FRP binders for boats is allowed based on the report documents of firms (manufacturers) or laboratories recognized by the Register.

Register approval for reinforcement materials applied for FRP manufacture is recommended (refer to 2.3.1.6)."

2. Para 2.2.4 is replaced by the following text:

"2.2.4 Technical supervision during manufacture of hull/structures using FRP.

2.2.4.1 Prior to manufacture, the manufacturer (a shipyard) shall submit the following:

- approved technical documentation in the scope specified in 1.4.2 (technical specifications on FRPs, technological instruction);
- reports on fire safety test results of FRPs carried out in laboratories recognized by the Register, with a conclusion on compliance of the fire protection with the requirements of these Rules according to which the ship design is approved;
- where FRPs other than those stated in this Part of the Rules are used, reports on FRP test results in accordance with the approved test program (refer to Appendix 2).

2.2.4.2 Technical supervision shall include the following:

- review of documents submitted by the firm (manufacturer) in a scope specified in 2.2.3.2 to confirm its capability of manufacturing FRP products of stable quality in required volumes;
- survey of the firm (manufacturer) to assess its capability of manufacturing FRP hulls/structures and quality control systems;
- technical supervision during manufacture in a scope specified in 1.5.1;
- technical supervision during tests of FRP specimens cut out from manufacturing allowances or witness sample (as applicable), complying with the technical documentation on the product manufactured;
- technical supervision of hull defects detection and repair.

Upon results of technical supervision during construction of hull or structure using FRPs, the report documents of shipyard shall be signed by the Register surveyor in accordance with the provisions of Section 13 “Technical Supervision at the Shipyard during Construction of Ships”, Part I of the Rules for Technical Supervision during Construction of Ships and Manufacture of Materials and Products for Ships, attaching Register Certificates for materials.

2.2.4.3 Where the Register Certificate for FRP is not available during technical supervision in the course of construction of hull or structure using FRPs, in addition to the requirements specified in Section 13 “Technical Supervision at the Shipyard during Construction of Ships”, Part I of the Rules for Technical Supervision during Construction of Ships and Manufacture of Materials..."
and Products for Ships the Report on Survey (form 6.3.29) shall be drawn up to confirm that the requirements for FRP specified in this Part of the Rules are met.

Structural scheme of a moulded butt (seam) joint of single-skin members without edge preparation:

1 — members being jointed; 2 — butt; 3 — straps.

".2 where the thickness of single-skin members being jointed does not exceed 10 mm, edge preparation may be omitted (refer to Fig. 3.2.6.2.2).

For this type of joint, strap parameters shall be selected from the following:

\[
\begin{align*}
    b_m & \geq 180 + 15s, \text{ in mm;} \\
    b_{c,1} & = 30 \div 50, \text{ in mm — half width of the first fiber layer of the strap;} \\
    b_{c,1} & = 15 \div 25, \text{ in mm — step width;} \\
    b_{c,2} & = 40 \div 50, \text{ in mm — width of the last } n \text{-th step of the strap;} \\
    t_m & \geq 0.5s, \text{ in mm — for butt straps with parallel reinforcement scheme (}0^\circ/90^\circ\text{);} \\
    t_m & \geq 0.8s, \text{ in mm — for butt straps with parallel and diagonal reinforcement scheme (}0^\circ/90^\circ\text{)/(}+45^\circ/-45^\circ\text{);} \\
    t_{c,1}, t_{c,2} & - \text{ step height equal to the total thickness of the fiber layers forming the step.}\n\end{align*}
\]
Figure 3.32 and references thereto are renumbered 3.2.6.2.4.

Figure 3.2.6.2.4 (former Figure 3.32) is replaced by the following one:

![Structural scheme of a moulded butt (seam) joint of single-skin members with double side stepped edge preparation](image)

Fig. 3.2.6.2.4
Structural scheme of a moulded butt (seam) joint of single-skin members with double side stepped edge preparation:
1 — members being jointed; 2 — butt; 3 — straps.

Para 3.2.6.2.4. The next to the last and the last paragraphs are replaced by the following text:

"Joint parameters for single-skin members shall be selected from the following:

\[ S_{\text{but}} = m''_{\text{but}} \cdot t_d, \text{ in mm}; \]

\[ m''_{\text{but}} \geq 2; \]

\[ n_1 = m'' - m''_{\text{but}}; \]

\[ m'' = \text{number of fabric layers in load-bearing layer}; \]

\[ m''_{\text{but}} = \text{number of fabric layers in the butt of load-bearing layer}; \]

\[ n_2 = (n_1 - 6)/3 \text{ (where } n_2 \text{ is a fractional number, it is rounded to the smallest integral value)}; \]

\[ t_m > \delta_{\text{max}}, \text{ in mm}, \]

where \( \delta_{\text{max}} \) \((i = 1,2)\) = maximum thickness of one of two load-bearing layers;

\[ S_{\text{but}} = \text{thickness of load-bearing layers in the butt}. \]

Other strap parameters, number of steps and their depth shall be determined from the above correlations for the stepped joint of single-skin members;".

Figure 3.33 and references thereto are renumbered 3.2.6.2.5.

Figure 3.2.6.2.5 (former Figure 3.33) is replaced by the following one:

![Structural scheme of a moulded butt (seam) joint of single-skin members with double stepped beveling](image)

Fig. 3.2.6.2.5
Structural scheme of a moulded butt (seam) joint of single-skin members with double stepped beveling:
1 — members being connected; 2 — butt; 3 — straps."
50. **Para 3.2.6.2.5.** The definition of the parameter \( b_s \) after the sentence "Parameters of butt joint with beveling for single-skin members shall be selected from the following:" is replaced by the following text:

\[ b_s = 15 \div 20, \text{ mm} \].

51. **Para 3.2.6.3.2.** Dimension "mm" is added to the parameter "s":

"where \( s \) = thickness of a horizontal member, in mm;".

52. **Figure 3.34** and references thereto are renumbered 3.2.6.3.2.

53. **Figure 3.2.6.3.2** (former Figure 3.34) is replaced by the following one:

![Structural scheme of a moulded fillet joint](image)

Fig. 3.2.6.3.2
Structural scheme of a moulded fillet joint:
1 — members being jointed; 2 — moulding-in angles; 3 — contact surface".

54. **Para 3.2.6.3.4** is replaced by the following text:

".4 for a stressed fillet joint, a horizontal single-skin member may be thickened under a vertical member, which may be both single-skin and sandwich, e.g. joint of a single-skin hull shell with a sandwich bulkhead. The foam plastic in core of the bulkhead in the area of joint with single-skin shell shall be replaced by that of the density increased by 30–40 kg/m\(^3\) (but not more than 200 kg/m\(^3\)) in the form of embedded elements of certain scantlings (refer to Fig. 3.2.6.3.4).

The shell is thickened by adding fiber layers (woven roving or biaxial fabric with \((0^\circ/90^\circ)\) reinforcement) between basic layers along the vertical member (across the hull). Thickness of the
thickened area shall taper towards edges, with each next fabric layer overlapping the preceding one with 20 — 25 mm increment. Thickened area scantlings shall be determined from the following:

\[ t_{th} = (0.2 + 0.3)S_{shell}; \]
\[ B_{th} \geq 2(b_{th} + 6t_{th}) + S_{bulk}, \]
\[ b_{angl} \geq 16t_{angl}, \]
\[ t_{angl} \geq 0.6S_{p}, \]

where

\[ S_{p} = \max(S_{shell}, S_{bulk}) \] — for connection of single-skin members;
\[ S_{p} = \max(S_{shell}, \delta_{bulk} + \delta_{bulk}) \] — for connection of a single-skin and a sandwich members;
\[ \delta_{bulk} = \text{thickness of the load-bearing layer of sandwich member}; \]
\[ R_{angl} = 2t_{angl}; \]
\[ t_{angl} = 1.2S_{bulk}. \]

APPENDIX 1

LONGITUDINAL AND BUCKLING STRENGTH OF HULL STRUCTURAL MEMBERS AND PLATES

(Recommendations on calculation)

1 STRESS-STRAIN BEHAVIOR OF FRAMING MEMBERS

84 Figure 1 and references thereto are renumbered 1.1.

85 Figure 1.1 (former Figure 1) is replaced by the following one:

![Figure 1.1](image)

Fig. 1.1
Calculation method for the closed box (trapezoidal) member:
1, 4 — load-bearing layers; 2 — core; 3 — reinforcement with a core of increased density; 5 — flange; 6 — member web; 7 — core of a member; 8 — attached plate*.

86 Para 1.1 is supplemented by the following text:

"The member cross-section shear stiffness is determined by the formula

\[ K_{11} = (2G_{13}^{w} t_{w} + G^{c} B_{c}) H \]

where \( H = H_{c} + t_{w} \)."

87 Figure 2 and references thereto are renumbered 1.3.

88 Table 1 and references thereto are renumbered 1.1.
2 BUCKLING STRENGTH OF FRAMING MEMBERS

Para 2.1. The formula for determination of $K_{11}$ is deleted.

Para 2.2 is supplemented by the following text:

"$l =$ member span, distance between member support sections.".

3 SHEAR STRESS-STRAIN BEHAVIOR OF SINGLE-SKIN PLATES

Section 3 is replaced by the following text:

"Shear strain-stress behavior of single-skin plates shall be determined by the following formulae:

$$w = k_1 \frac{pb^4}{E_1 t^3};$$

$$M_1 = k_2 pb^2;$$

$$M_2 = k_3 pb^2;$$

$$M_2' = k_5 pb^2,$$

where $p =$ design uniformly distributed load intensity;

$M_1 =$ bending moment at the plate center in the section parallel to axis $y$ per unit length of the section;

$M_2 =$ bending moment at the laminate center in the section parallel to axis $x$ per unit length of the section;

$M_2'$ = bending moment in the middle of the longer side of the supporting contour in the section parallel to axis $x$ per unit length of the section;

$E_1$ and $E_2 =$ Young's moduli of the load-bearing layer in the direction of main reinforcement (direction $0^\circ$) and in the direction $90^\circ$ to the main reinforcement;

$t =$ plate thickness.

Values of factors $k_i$ for isotropic and orthotropic plates, with the Young's moduli ratio along the shorter and longer sides of the plate equal to 1.0 and 1.5 are specified in Tables 3-1 and 3-2, for fixed bearing edges, and for plates with freely supported edges.

Where hull or deck platings are made with parallel and diagonal reinforcement schemes $[(0^\circ/90^\circ)/(+45^\circ/-45^\circ)/(0^\circ/90^\circ)/.../(+45^\circ/-45^\circ)/(0^\circ/90^\circ)]$, plates shall be considered as isotropic ones with average values equal to a half-sum of the relevant characteristics in warp and weft directions of parallel layers:

$$E_{av} = \frac{E_1 + E_2}{2};$$

$$v_{av} = \frac{v_{12} + v_{21}}{2},$$

where $v_{12}$ and $v_{21} =$ Poisson's ratios of the plate material (refer to Fig. 3).

The values specified for orthotropic plates refer to FRPs with parallel reinforcement schemes $[(0^\circ/90^\circ)]$ ($E_1/E_2 = 1.0; E_1/G_{12} = 5$) and ($E_1/E_2 = 1.5; E_1/G_{12} = 6$), positioned with $1 - (0^\circ)$ direction along the shorter side.

Maximum normal stresses in the plate are determined by the formula

$$\sigma_{ii} = \pm 6M_i/t^2 ".$$
4 BUCKLING STRENGTH OF SINGLE-SKIN PLATES IN COMPRESSION

Para 4.1 is replaced by the following text:

"4.1 The buckling strength of freely supported single-skin plates in compression (Fig. 4.1) shall be determined with account of the aspect ratio of plate sides \( \gamma = a/b \).

![Fig. 4.1](image)

Calculation method of single-skin plates in compression".

Para 4.2 is replaced by the following text:

"4.2 FRPs with parallel reinforcement scheme \([(0^\circ/90^\circ)]\).

Critical stress is determined by the formula

\[
\sigma_{buck} = E_1 B (t/b)^2,
\]

where \( E_1 \) = Young's compression modulus; \( B \) = factor depending on the aspect ratio of plate sides;

\[
B = \frac{(m/\gamma)^2 + [v_{12} + v_{21}^2(1-v_{12}v_{21})] \pi m^2}{12(1-v_{12}v_{21})},
\]

where \( \gamma = a/b \) — aspect ratio of plate sides;
(\( m \) = number of half waves at buckling failure;
(\( t \) = plate thickness;
(\( E_1 \) and \( E_2 \) = Young's moduli in the direction of main reinforcement (direction 0°) and in the direction 90° to the main reinforcement;
(\( G_{12} \) = shear modulus in the plate plane (refer to Fig. 4.1);
(\( v_{12} \) and \( v_{21} \) = Poisson's ratios of the plate material (refer to Fig. 4.1)."

Para 4.3 is replaced by the following text:

"4.3 FRPs with parallel and diagonal reinforcement schemes \([(0^\circ/90^\circ)/(+45^\circ/-45^\circ)/(0^\circ/90^\circ)/.../(+45^\circ/-45^\circ/(0^\circ/90^\circ))\].

When determining finite stiffness FRP plates with parallel and diagonal reinforcement scheme, the calculation method for relevant isotropic plates may be used. In such case, the average values of Young's modulus and Poisson's ratio shall be determined by the following formulae:

\[
E_{av} = \frac{E_1 + E_2}{2};
\]

\[
v_{av} = \frac{v_{12} + v_{21}}{2}.
\]

Critical stress is determined by the formula

\[
\sigma_{buck} = E_{av} B (t/b)^2.
\]
Values of factor $B$ for $0.4 \leq \gamma \leq 3.0$ are specified in Table 4.3 and in Figs. 4.3-1 — 4.3-3.

97 **Figures 4 — 6** and references thereto are renumbered 4.3-1 — 4.3-3 accordingly.

98 **Figures 4.3-1 — 4.3-3** (former Figures 4 — 6). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_{p}^{bl}$ are replaced by $E_{1}$.

99 **Table 4** and references thereto are renumbered 4.3.

100 **Table 4.3** (former Table 4). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_{p}^{bl}$ are replaced by $E_{1}$.

5 SHEAR BUCKLING STRENGTH OF SINGLE-SKIN PLATES

101 **Para 5.1** is replaced by the following text:

"**5.1** The buckling strength of freely supported single-skin plates (Fig. 5.1) for shear stress of FRPs with parallel reinforcement scheme [(0°/90°)] shall be determined with account of the aspect ratio of plate sides $\gamma = a/b$.

![Fig. 5.1](image)

Fig. 5.1
Calculation method of single-skin plates under shear

102 **Existing paras 5.1.1 and 5.1.2** are renumbered 5.2 and 5.3 accordingly.

103 **Para 5.2** is replaced by the following text.

"**5.2** At $\gamma \geq 1$ the shear critical stress is determined by the formula

$$
\tau_{buck} = \frac{E_{1}}{\gamma^{4} + 2E_{3}/\gamma^{4} + E_{2}}B(t/b)^{2},
$$

where $E_{3} = E_{1}v_{21} + 2(1 - v_{12}v_{21})G_{12}$;

$$
B = \frac{\pi^{y}y}{384(1-v_{12}v_{21})} \left( \frac{100}{1,395 + 4(k_{1} + k_{2})} \right),
$$

where

$$
\begin{align*}
    k_{1} &= \frac{1 + 2y^{2} + y^{4} + y^{6}}{81 + 18y^{2} + 81y^{4}}, \\
    k_{2} &= \frac{1 + 2y^{2} + y^{4} + y^{6}}{81 + 18y^{2} + 81y^{4}}; \\
    A &= \frac{v_{21} + 2}{E_{1}}(1 - v_{12}v_{21}); \\
    \gamma &= \frac{a}{b}; \\
    \xi &= \frac{E_{2}}{E_{1}}; \\
    E_{1}, E_{2}, G_{12}, v_{12} \text{ and } v_{21} &- \text{ refer to 4.
}
\end{align*}
$$

Note. Reinforcement direction (0°) — along side of length $a$ (refer to Fig. 5.1).

Values of factor $B$ for $\gamma \geq 1$ are specified in Table 5.2 and in Fig. 5.2."

104 **Table 5** and references thereto are renumbered 5.2.

105 **Table 5.2** (former Table 5). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_{p}^{bl}$ are replaced by $E_{1}$. 
Figure 7 and references thereto are renumbered 5.2.

Figure 5.2 (former Figure 7). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_p^{bl}$ are replaced by $E_1$.

Para 5.3 is replaced by the following text:

"5.3 At $\gamma = 0.5$ the shear critical stress is determined by the formula

$$\tau_{buck} = B \left(\frac{t}{b}\right)^2,$$

where

$$B = 0.00952 \frac{\pi^4}{1 - \nu_1^2 \nu_2^2} \sqrt{D - \sqrt{D^2 - 9.58C}};$$

where

$$C = E' \cdot E \cdot E;$$
$$D = 4.82E'E'E + 1.31E'E + 0.64E' \cdot E + 0.101E \cdot E;$$
$$E' = E_1 + 2E_3 + E_2;$$
$$E = 16E_1 + 18E_3 + 5.06E_2;$$
$$E = E_1 + 8E_3 + 16E_2;$$
$$E = 16E_1 + 50E_3 + 39E_2.$$

Values of factor $B$ for $\gamma = 0.5$ are specified in Table 5.3 and in Fig. 5.3."

Table 6 and references thereto are renumbered 5.3.

Table 5.3 (former Table 6). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_p^{bl}$ are replaced by $E_1$.

Figure 8 and references thereto are renumbered 5.3.

Figure 5.3 (former Figure 8). Symbols $G_{12}^{bl}$ are replaced by $G_{12}$ and symbols $E_p^{bl}$ are replaced by $E_1$.

Figure 5.3 (former Figure 8). Dimension "$E_1$, GPa" is added to axis $x$.

6 STRESS-STRAIN BEHAVIOR OF SANDWICH PLATES AT CYLINDRICAL BENDING

Section 6 is replaced by the following text:

"This Section contains the formulae to determine maximum deflections, maximum normal stresses in load-bearing layers and maximum shear stresses in the core for sandwich plates with isotropic core of the FRP hull structures.

Transverse deflection of cylindrical plate bending taking into account various modes of plate edge attachment (Fig. 6) where $\gamma = a/b > 3$ is considered. In all cases, the load shall be perpendicular to the plate plane."
Symbols.
For the purpose of this Section, the following symbols have been adopted:

- \( \delta \) = thickness of each load-bearing layer, in m;
- \( h \) = half thickness of the sandwich plate core, in m;
- \( E_{ll} \) = Young’s modulus of load-bearing layers made of isotropic material, in Pa;
- \( G_{ll} \) = shear modulus in plane of load-bearing layers, in Pa;
- \( \mu_{ll} \) = Poisson’s ratio of load-bearing layers;
- \( E_{core} \) = Young’s modulus of the isotropic core, in Pa;
- \( G_{core} \) = shear modulus of the isotropic core, in Pa;
- \( \mu_{core} \) = Poisson’s ratio of the isotropic core;
- \( q \) = uniformly distributed transverse load per surface area, in N/m\(^2\);
- \( p \) = uniformly distributed transverse load per unit length, in N/m;
- \( W \) = maximum deflection of load-bearing layers of the plate, in m;
- \( \sigma_x \) = maximum normal stresses in load-bearing layers, in Pa;
- \( \tau_{xz} \) = maximum shear stresses in the isotropic core, in Pa.

Where load-bearing layers are made of the same isotropic material and have the same thickness, the following conditions shall be met:

\[
E_{1}^1 = E_{2}^2 = E_{ll}, \quad \mu_{ij}^1 = \mu_{ij}^2 = \mu_{ll}, \quad \delta_1 = \delta_2 = \delta,
\]

where \( i, j = 1, 2, 3 \) — directions of coordinate axes;
- \( E_{1}^1, E_{2}^2 \) = Young’s moduli of load-bearing layers;
- \( \mu_{ij}^1, \mu_{ij}^2 \) = Poisson’s ratios of load-bearing layers;
- \( \delta_1, \delta_2 \) = thicknesses of load-bearing layers.

For the core made of isotropic material, the following conditions shall be met:

\[
E_{core}^1 = E_{core}^2 = E_{core}, \quad \mu_{ij} = \mu_{core},
\]

where \( E_{core}^1 = E_{core}^2 \) = Young’s modulus of the core;
- \( \mu_{ij} = \) Poisson’s ratio of the core.

The formulae specified in this Section may be used where the following conditions are met:

\[
2,0 \cdot 10^{-4} \leq G_{core}/E \leq 2,0 \cdot 10^{-2}, \quad 0,1 \leq \delta/h \leq 0,25,
\]

where \( E = E_{ll}/(1-\mu_{ll}^2) \).

The formulae may be used for calculation of sandwich plates with orthotropic load-bearing layers, where their Young’s moduli do not vary more than 20 % (relative to the highest value of the moduli), i.e. if the following condition is met:

\[
(1 - E_2/E_1) \cdot 100 < 20 \% \quad \text{at } E_1 > E_2,
\]

where \( E_1 \) and \( E_2 \) = Young’s moduli of the load-bearing layer in the direction of main reinforcement (direction 0°) and in the direction 90° to the main reinforcement.

In this case, the arithmetic mean shall be taken as the Young’s modulus for calculations. The values used in the formulae specified in Table 6 are determined by the following formulae:

\[
B_{ll} = \frac{E_{ll}\delta}{1-\mu_{ll}^2}, \quad B_{core} = \frac{2G_{core}h}{1-\mu_{core}^2}, \quad D_{ll} = \frac{E_{ll}\delta^3}{12(1-\mu_{ll}^2)}, \quad D_{core} = \frac{G_{core}h^2}{3},
\]

\[
k = \frac{\pi^2 B_{ll}h_{long}}{G_{core}a^2}, \quad \gamma = \frac{\pi}{a} \sqrt{\frac{1}{9}\left(k\frac{2D_{ll}}{D_{pl}}\right)}, \quad h_{long} = h\left(1 + \frac{D_{core}}{2B_{ll}h^2}\right).
\]
\[ \eta = 1 + \frac{D_{\text{core}} \delta^2}{8 h_{\text{long}} D_{\text{pl}}} D_{\text{pl}} = 2(D_{\text{ll}} + B_{\text{ll}}(h + \delta/2)^2) + D_{\text{core}}, \quad \bar{E} = \frac{E_{\text{ll}}}{1 - \mu_{\text{ll}}^2}. \]

115 **Table 7** and references thereto are renumbered 6.

116 **Table 6** (former Table 7). Formulae for factors \( m_2 \) and \( m_3 \) in column "Stresses" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed" are replaced by the following ones:

\[
\begin{align*}
\text{"}m_2 &= 1 - \frac{4k}{\pi^2} \cdot \frac{\delta}{h_{\text{long}}} + \frac{4D_{\text{ll}}}{D_{\text{pl}}} \frac{2 + 6 / h_{\text{long}}}{1 + \delta / h} \times \left( \frac{\delta}{h} + \frac{2D_{\text{ll}}}{D_{\text{pl}}} \left(1 - \frac{D_{\text{core}} \delta}{4h D_{\text{ll}}} \right) - \frac{\delta}{h(2 + 6 / h_{\text{long}})} \left(1 - \frac{2D_{\text{ll}}}{D_{\text{pl}}} \right) \right)\text{"}, \\
m_3 &= (1 - \frac{2D_{\text{ll}}}{D_{\text{pl}}} \left(1 - \frac{4k}{\pi^2} \cdot \frac{\delta}{h_{\text{long}}} + \frac{2D_{\text{ll}}}{D_{\text{pl}}} \right)) \cdot \frac{n}{2} \cdot \text{th}(\frac{\gamma}{2})\text{"}.
\end{align*}
\]

117 **Table 6** (former Table 7). The first paragraph and formula in column "Deflections" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed" are replaced by the following text:

"Plate deflection is maximum in the section at \( x = a/2 \):
\[ |W| = \frac{5}{384} \cdot \frac{a^2}{D_{\text{pl}}} \cdot m_1. \]

118 **Table 6** (former Table 7). The formula in column "Stresses" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the center section" is replaced by the following one:

\[ |\sigma_x| = \left| \frac{p a}{a^2} \cdot \frac{B_{\text{ll}}(h + \delta)}{6D_{\text{pl}}} \cdot m_2 \right|. \]

119 **Table 6** (former Table 7). The first paragraph in column "Stresses" for the type of load "Plate edges are fixed, the transverse load is uniformly distributed" is replaced by the following text:

"Normal stresses in load-bearing layers are maximum at \( x = 0, a; z = \pm(h + \delta)\)."

120 **Table 6** (former Table 7). The formula for factor \( m_1 \) in column "Deflections" for the type of load "Plate edges are fixed, the transverse load is uniformly distributed in the center section" is replaced by the following one:

\[ m_1 = 1 + \frac{4bh}{\pi^2} \left(1 - \frac{2D_{\text{ll}}}{D_{\text{pl}}} \right) \times \left(1 - \frac{4h}{\pi} \cdot \frac{\gamma}{a} \right). \]

121 **Table 6** (former Table 7). The formula for factor \( m_2 \) in column "Stresses" for the type of load "Plate edges are fixed, the transverse load is uniformly distributed in the center section" is replaced by the following one:

\[ m_2 = 1 - \frac{\text{th}(\gamma a/4)}{\eta(1 + 6 / h)(\gamma a/4)} \times \left(1 - \frac{D_{\text{core}} \delta}{4h D_{\text{ll}}} \right) \left(1 + \frac{\delta}{2h_{\text{long}}} \right) - \frac{8D_{\text{pl}}}{4h D_{\text{ll}}} \left(1 - \frac{2D_{\text{ll}}}{D_{\text{pl}}} \right)\right). \]

122 **Table 6** (former Table 7). The second inequality in columns "Stresses" and "Deflections" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" is deleted.

123 **Table 6** (former Table 7). The formula for determination of the plate deflection for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" is replaced by the following one:

\[ |W| = \left| \frac{p}{D_{\text{pl}}} \cdot \left[C_2 - C_1 \cdot x + C_3 \cdot \left(\frac{2B_{\text{ll}}(h + \delta/2)}{G_{\text{core}}} - \frac{x^2}{3}\right) \cdot x - \frac{C_4 x^2}{2} + C_5 \cdot \text{sh}(k_1 \cdot x) + C_6 \cdot \text{ch}(k_1 \cdot x)\right]\right|. \]
\textbf{Table 6} (former Table 7). The formula for factor $C_2$ in column "Deflections" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" is replaced by the following one:

$$C_2 = a/2 - \xi - b h (k+5/2) \left( b h k + 1 \right)^2 + \frac{1}{3} (a - \xi) + \frac{x^2}{6}.$$ 

\textbf{Table 6} (former Table 7). The formula for factor $C_6$ in column "Deflections" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" is replaced by the following one:

$$C_6 = - \frac{2 h (k+6/2)^2 \cdot \operatorname{sh}(k (a/2 - 1))}{2 b h k \cdot \operatorname{ch}(k (a/2))}.$$ 

\textbf{Table 6} (former Table 7). The last paragraph in column "Deflections" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" is replaced by the following text:

"Plate deflection is maximum in the section, with coordinate $\partial W/\partial x = 0$ and within the range $-a/2 \leq x \leq \xi$; (plate deflection at $x = \xi$ differs from the maximum value by not more than 10\%)."

\textbf{Table 6} (former Table 7). The formula for determination of tangential stresses in the core and preceding text in column "Stresses" for the type of load "Plate edges are freely supported, the transverse load is uniformly distributed in the random section" are replaced by the following text:

"tangential stresses in the core are maximal at $-a/2 \leq x \leq \xi$; $z = 0$ (at $\xi \leq 0$):

$$|r_{xx}| = \frac{1}{D_{pl}} \times 2 B h (k+6/2) \left[ C_3 + \frac{D_{pl} k^3}{2 B h (k+6/2)^2} \times \left( C_5 \cdot \operatorname{ch}(-k a/2) + C_6 \cdot \operatorname{sh}(-k a/2) \right) \right].$$

\textbf{Table 6} (former Table 7). The formula for determination of normal stresses in load-bearing layers in column "Stresses" for the type of load "Laminate edges are free-standing, the transverse load is distributed according to the triangular law" is replaced by the following one:

$$\left|\sigma_x\right| = \left| \frac{q_0 x}{4 h} \times \left( \frac{2 (k+6)}{D_{pl} (2 h+6)} \left( \frac{h B}{\delta_{core}} + \frac{a^2-x^2}{6} \right) - \frac{h B}{\delta_{core}} \right) \right|.$$ 

\textbf{Table 6} (former Table 7). The factor $x_2$ in the formula for determination of the plate deflection maximum value in column "Deflections" for the type of load "Laminate edges are free-standing, the transverse load is distributed according to the triangular law" is replaced by $x_1$.

\textbf{Table 6} (former Table 7). The formula for factor $m_1$ in column "Deflections" for the type of load "Laminate edges are free-standing, the transverse load is distributed according to the triangular law" is replaced by the following one:

$$m_1 = \frac{q_0}{180 B h (2 h+6)^2}.$$ 

\textbf{7 STRESS-STRAIN BEHAVIOR OF SANDWICH PLATES AT CYLINDRICAL BENDING EXPOSED TO LOCAL LOADS}

\textbf{Section 7}. The first paragraph is replaced by the following text:

"This Section contains the formulae to determine maximum deflections, maximum normal stresses in load-bearing layers and maximum shear stresses in the core for sandwich plates with isotropic core of the FRP hull structures. The sandwich plate cylindrical bending (Fig. 6) when exposed to local loads is considered."
Section 7. The following explication is added to the formula 
\[(1 - E_2/E_1) \cdot 100 < 20 \% \text{ at } E_1 > E_2\] :

"where \( E_1 \) and \( E_2 \) = Young's moduli of the load-bearing layer in the direction of main reinforcement (direction 0°) and in the direction 90° to the main reinforcement.".

Section 7. The inequality for determination of maximum normal stresses acting in the upper load-bearing layer of the plate is replaced by the following one:

\[\sqrt{E_{core}/E_{II}} \cdot (2h/6) \leq 8,0,\]

Section 7. The inequality for determination of maximum deflections of the plate is replaced by the following one:

\[\sqrt{E_{core}/E_{II}} \cdot (2h/6) \leq 1,6,\]

Table 8 and references thereto are renumbered 7.

Table 7 (former Table 8). The formula for determination of plate deflection in column "Deflections" for the type of load "The plate is loaded with the moment uniformly distributed over the plate's width in any section" is replaced by the following one:

\[|W| = \left| M \frac{3}{4E_{II}b^3} e^{-mx} \sin(mx) \right|,\]

Table 7 (former Table 8). The expressions for \( C_{\phi}'' \) and \( C_{\beta}''' \) in the explication to formula in column "Stresses" for the type of load "The transverse load uniformly distributed in the local region of the plate in any area" are replaced by the following ones:

\[C_{\phi}'' = -2 \cdot (\sin(\varphi) \cdot \cos(\varphi) + \sin(\varphi)),\]
\[C_{\beta}''' = -2 \cdot (\sin(\beta) \cdot \cos(\beta) + \cos(\beta)),\]

Table 7 (former Table 8). The expression for \( C_{\beta}''' \) in the explication to formula in column "Deflections" for the type of load "The transverse load uniformly distributed in the local region of the plate in any area" is replaced by the following one:

\[C_{\beta}''' = -2 \cdot (\sin(\beta) \cdot \cos(\beta) + \cos(\beta)),\]

Table 7 (former Table 8). The common text in columns "Stresses" and "Deflections" for the type of load "The transverse load distributed according to the triangular law is applied in the local region of the plate in any area" is replaced by the following text:

"The distributed load value depending on the section coordinate is determined by the formula \( q = q_{max} (x - a)/b \) in such case, parameter \( a \) shall be selected to meet the following condition: \( 20\delta \leq a \leq 30\delta \)."

Table 7 (former Table 8). The expressions for \( C_{\phi}''' \) and \( C_{\alpha\beta}''' \) in the explication to formula in column "Stresses" for the type of load "The transverse load distributed according to the triangular law is applied in the local region of the plate in any area" are replaced by the following ones:

\[C_{\phi}''' = -2 \cdot (\sin(\varphi) \cdot \cos(\varphi) + \sin(\varphi)),\]
\[C_{\alpha\beta}''' = -2 \cdot (\cos(\alpha + \beta) \cdot \sin(\alpha + \beta)),\]

Table 7 (former Table 8). The expressions for \( C_{\phi}''' \) and \( C_{\alpha\beta}''' \) in the explication to formula in column "Deflections" for the type of load "The transverse load distributed according to the
triangular law is applied in the local region of the plate in any area“ are replaced by the following ones:

\[ C_{\varphi}'' = -2 \cdot \left( \text{sh}(\varphi) \cdot \cos(\varphi) + \text{ch}(\varphi) \cdot \sin(\varphi) \right), \]
\[ C_{\alpha\beta}'' = -2 \cdot \left( \text{sh}(\alpha + \beta) \cdot \cos(\alpha + \beta) + \text{ch}(\alpha + \beta) \cdot \sin(\alpha + \beta) \right). \]

8 STRESS-STRAIN BEHAVIOR OF SANDWICH PLATES AT BENDING

Para 8.1 is replaced by the following text:

"8.1 Plate edges are freely supported, the transverse load is uniformly distributed. The formulae to determine maximum deflections, maximum normal stresses in load-bearing layers and maximum shear stresses in the core for symmetric sandwich plates with same thickness isotropic outer layers and transversally isotropic core with the isotropy plane matching the plate plane are given in 8.2. Transverse deflection of sandwich plates is considered. The load shall be perpendicular to the plate plane.

The formulae may also be used for calculation of plates with isotropic core.

Symbols.
For the purpose of this Section, the following symbols have been adopted:

\( a \) = plate length, in m;
\( b \) = plate width, in m;
\( \delta \) = thickness of each load-bearing layer, in m;
\( h \) = half thickness of the sandwich plate core, in m;
\( E_{bl} \) = Young’s modulus of load-bearing layers in the sandwich plate, in Pa;
\( v_{12(b1)} \) = Poisson’s ratio of the material of load-bearing layers in the sandwich plate;
\( E_{core} \) = Young’s modulus of core in isotropy plane of the sandwich plate, in Pa;
\( G_{core} \) = shear modulus of the core in plane that is orthogonal to the isotropy plane of the sandwich plate, in Pa;
\( v_{core} \) = Poisson’s ratio of the core of sandwich plate;
\( p \) = uniformly distributed load, in N/m²;
\( w \) = maximum deflection of load-bearing layers of the plate, in m;
\( \sigma_x, \sigma_y \) = maximum normal stresses in load-bearing layers, in Pa;
\( \tau_{xz}, \tau_{yz} \) = maximum shear stresses in the core, in Pa.

Calculations as per Formulae in 8.2 may be performed if the following conditions are met:

\[ \frac{G_{core}}{E_{bl}} \left( 1 - v_{12(b1)}^2 \right) > 0.005 \text{ at } \frac{2h}{a} \sqrt{1 + \left( \frac{a}{b} \right)^2} \leq 0.3 \text{ and } 0.01 \leq \frac{\delta}{h} \leq 0.5. \]
Para 8.2 is replaced by the following text:

"8.2 Plate deflection is maximum at point $x = a/2$, $y = b/2$ and determined by the formula

$$|w|_{x=a/2,y=b/2} = \frac{8p}{\pi^2 G_{\text{core}}} m_1,$$

where

$$m_1 = \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} (-1)^{(m-1)/2} (-1)^{(n-1)/2} \frac{1}{\alpha m \pi r} \left( k_1 \text{ch}(r_1 h) + B_{ll} \frac{r_1}{G_{\text{core}}} \text{sh}(r_1 h) \right);$$

$$B_{ll} = \frac{E_{bl}}{(1-v_{bl}^2) G_{\text{core}}},$$

$2h$ = core thickness of the sandwich plate;

$m = 2i + 1, n = 2j + 1, \alpha = m \pi / a, b = n \pi / b$;

$r^2 = a^2 + \beta^2, r_1 = r k_1$;

$$k_1 = \sqrt{\frac{E_{\text{core}}}{(1-v_{\text{core}}^2) G_{\text{core}}}},$$

$$d = \left( h + \frac{p \delta_1^2 r_1}{G_{\text{core}}} \right) r_1 \text{ch}(r_1 h) - \left( 1 - \frac{E_{bl} r^2}{G_{\text{core}}} (h + \delta + \frac{p \delta_1^2 r_1}{12 E_{\text{core}}}) \right) \text{sh}(r_1 h).$$

Normal stresses in load-bearing layers $\sigma_x$ and $\sigma_y$ are maximum at $x = a/2$, $y = b/2$ and determined by the following formulae:
The shear stresses in the core $\tau_{xz}$ are maximum at $x = 0$; $a, y = b/2$ and determined by the formula

$$|\sigma_x|_{x=a/2, y=b/2} = \frac{8pE_l}{(1-v^{12}_{2l}(b))\pi^2G_{core}} m_2,$$

$$m_2 = \sum_{i=0}^{N} \sum_{j=0}^{N} \left( -1 \right)^{(m-1)/2}\left( -1 \right)^{(n-1)/2} \frac{1}{a_i n_i} \left( \alpha^2 + v^{12}_{12}(b) \beta^2 \right) \left( \delta r_i h_j + \left( 1 + \frac{8a_i \delta r_i^3}{2G_{core}} \right) \sinh(r_i h_j) \right);$$

$$|\sigma_y|_{x=a/2, y=b/2} = \frac{8pE_l}{\pi a G_{core}} m_3,$$

$$m_3 = \sum_{i=0}^{N} \sum_{j=0}^{N} \left( -1 \right)^{(m-1)/2}\left( -1 \right)^{(n-1)/2} \frac{1}{a_i n_i} \left( \beta^2 + v^{12}_{12}(b) \alpha^2 \right) \left( \delta r_i h_j + \left( 1 + \frac{8a_i \delta r_i^3}{2G_{core}} \right) \sinh(r_i h_j) \right).$$

Shear stresses in the core $\tau_{yz}$ are maximum at $x = 0$; $a, y = b/2$ and determined by the formula

$$|\tau_{yz}|_{x=a/2; y=0,b} = \frac{8pE_l}{\pi b G_{core}} m_4,$$

where

$$m_4 = \sum_{i=0}^{N} \sum_{j=0}^{N} \left( -1 \right)^{(m-1)/2}\left( -1 \right)^{(n-1)/2} \frac{1}{a_i n_i} \left( \sinh(r_i h_j) + \frac{r_i h_j}{2} + \frac{G_{core} r_i}{G_{core}} \sinh(r_i h_j) \right).$$

$N$ is taken so that the difference between values of neighboring terms of series does not exceed 5%.

Values of factors $m_i$, $i = 1, 5$ for sandwich plates with the most rational geometric and physical properties $h/\delta = 5$ and $v_{core} = 0.38 \pm 0.4$ are specified in Figs. 8.2-1 — 8.2-15.

For other values of $h/\delta$ and $v_{core}$, factors $m_i$, $i = 1, 5$ are determined by the formulae specified in this Section.

Values of $\gamma$ and $\eta$ are determined by the following formulae (refer to Figs. 8.2-1 — 8.2-15):

$$\gamma = a/b;$$

$$\eta = E_{bl}/E_{core}.$$
Values of thickness $\delta$, in mm, of the sandwich plate load-bearing layer are shown in circles.

Values of factor $m_1$ at $\eta = 800$ for sandwich plates having length $a$, in mm.

Figure 8.2-4 (former Figure 13) is replaced by the following one:

*Values of thickness $\delta$, in mm, of the sandwich plate load-bearing layer are shown in circles. Values of geometric properties of the sandwich plates for which diagrams of factor $m_2$ coincide in different combinations of $a$ and $\delta$ are shown in ovals.*

Values of factor $m_2$ at $\eta = 100$ for sandwich plates of length $a$, in mm.
Figure 8.2-5 (former Figure 14) is replaced by the following one:

Values of thickness $\delta$, in mm, of the sandwich plate load-bearing layer are shown in circles. Values of geometric properties of the sandwich plates for which diagrams of factor $m_2$ coincide in different combinations of $a$ and $\delta$ are shown in ovals.

Fig. 8.2-5

Values of factor $m_2$ at $\eta = 400$ for sandwich plates of length $a$, in mm.
Values of thickness $\delta$, in mm, of the sandwich plate load-bearing layer are shown in circles. Values of geometric properties of the sandwich plates for which diagrams of factor $m_2$ coincide in different combinations of $a$ and $\delta$ are shown in ovals.

Fig. 8.2-6

Values of factor $m_2$ at $\eta = 800$ for sandwich plates of length $a$, in mm.

---

Figure 8.2-7 (former Figure 16). The caption of the figure is replaced by the following text:

"Values of thickness $\delta$, in mm, of the sandwich plate load-bearing layer are shown in circles. Values of geometric properties of the sandwich plates for which diagrams of factor $m_3$ coincide in different combinations of $a$ and $\delta$ are shown in ovals.

Fig. 8.2-15

Values of factor $m_5$ at $\eta = 800$ for sandwich plates of length $a$, in mm".

Para 8.3 is replaced by the following text:

"8.3 Plate edges are fixed along the supporting contour.

The formulae to determine maximum deflections, maximum normal stresses in load-bearing layers for symmetric sandwich plates with same thickness isotropic outer layers are given in 8.2. Transverse deflection of sandwich plate is considered. The load shall be perpendicular to the plate plane.

![Diagram of sandwich plate](image)

8.4 Plate deflection, in mm, is maximum at $x = a/2$, $y = b/2$ and determined by the formula

$$ |w|_{x=a/2, \ y=b/2} = \frac{p b^2}{10^3 (2h+\delta)} \left[ \frac{m_1 b^2}{E_b h (2h+\delta)} + \frac{\bar{m}_1}{c_{core}} \right], $$

where $a =$ length of the sandwich plate, in m;
Values of factor $m_1$ depending on Poisson’s ratio $\nu$ of the load-bearing layers of the sandwich plate and ratio of plate sides $\gamma = a/b$ are specified in Fig. 8.4-1. Values of factor $\bar{m}_1$ depending on ratio of plate sides $\gamma = a/b$ are specified in Fig. 8.4-2. Normal stresses $\sigma_x$, in Pa, are maximum at $x = 0; a, y = b/2$ and determined by the formula

$$|\sigma_x|_{x=0, y=b/2} = \frac{p \cdot h^2}{\delta} \frac{1 + h/\delta}{(1 + 2h/\delta)^2} m_2,$$

where $m_2 = \text{factor.}$
Fig. 8.4-1  
Values of factor $m_1$
Normal stresses $\sigma_y$, in Pa, are maximum at $x = a/2, y = 0; b$ and determined by the formula

$\sigma_y = \bar{m}_1 \cdot \rho_y$

where $\bar{m}_1$ is the factor from Fig. 8.4-2, $\rho_y$ is the material property in Pa, $a$ and $b$ are the dimensions of the structure.
\[ \left| \sigma_y \right|_{x=a/2, y=0; b} = p \frac{b^2}{\delta^2} \left( \frac{1 + h/\delta}{(1 + 2h/\delta)^2} \right) m_3, \]

where \( m_3 = \) factor.

Values of factors \( m_2 \) and \( m_3 \) depending on Poisson's ratio \( \nu \) of the load-bearing layers of the sandwich plate and ratio of plate sides \( \gamma = a/b \) are specified in Figs. 8.4-3 — 8.4-4 accordingly.
9 BUCKLING STRENGTH OF SANDWICH PLATES

Preamble of Section 9 is replaced by the following text:

"9.1 This procedure is intended for buckling strength calculation of sandwich plates with isotropic core. The procedure allows determining the critical buckling load at one-sided uniform compression, with edges attached in different ways.

The calculation procedure is applied to rectangular symmetric plates over thickness \( \delta_1 = \delta_2 = \delta \). Load-bearing layers and core are isotropic materials, i.e. for load-bearing layers and the core the following conditions are met accordingly:
\[ E_i(b_{l1}) = E_i(b_{l2}) = E_{bl}; \quad v_{ij}(b_{l1}) = v_{ij}(b_{l2}) = v_{12}(bl); \]
\[ E_{(core)} = E_{core}; \quad G_{ij(core)} = G_{core}; \quad v_{ij(core)} = v_{core}. \]

This procedure may be also used for calculation of stress-strain behavior of sandwich plates with orthotropic load-bearing layers when \( E_1(b_{l1}) > E_2(b_{l2}) \) and \((1 - E_2(b_{l2})/E_1(b_{l1})) \cdot 100 \% < 20 \%\), whereas the following conditions for geometric properties and elastic characteristics are met:

\[ 0,01 \leq \frac{G_{core}}{E_1(b_{l1})} \leq 0,1; \quad 0,01 \leq \frac{\delta}{h} \leq 0,25; \quad \frac{2h}{a} \sqrt{1 + (a/b)^2} \leq 0,3. \]

In such case, the core takes up only transverse loads preventing contact between the layers.

Paras 9.1 and 9.2 are renumbered 9.2 and 9.3 accordingly.

Figure 30 and references thereto are renumbered 9.2.

Figure 9.2 (former Figure 30) is replaced by the following one:

![Diagram of a rectangular sandwich plate](image-url)
Para 9.3 (former para 9.2) is replaced by the following text:

"9.3 Buckling load $T_{\text{buck}}$, in N/m, is determined by the formula

$$T_{\text{buck}} = m_t \frac{\pi^2 D}{b^2},$$

where 

- $D = 2D_1 + D_{\text{core}} + 2B_1(h + \frac{2}{2})^2$;
- $D_1 = \frac{E_1 \delta^2}{12(1-v_{12}^2)}$;
- $B_1 = \frac{E_1 \delta}{1-v_{12}^2}$;
- $D_{\text{core}} = \frac{2E_{\text{core}} h^3}{3(1-v_{\text{core}}^2)}$;
- $E_1 = \text{Young's modulus of load-bearing layers along the sandwich plate longer side, in Pa};$
- $E_{\text{core}} = \text{Young's modulus of the sandwich plate core, in Pa};$
- $v_{12} = \text{Poisson's ratio of the material of load-bearing layers plane in the sandwich plate};$
- $v_{\text{core}} = \text{Poisson's ratio of the material of the sandwich plate core}.$

Where $\frac{h}{\delta} = 5$, buckling load $T_{\text{buck}}$, in N/m, is determined by the formula

$$T_{\text{buck}} = m_m \frac{\pi^2 E_{\text{core}} \delta^2}{b^2},$$

where 

- $m_m = \frac{2}{3} \left[ \frac{91\eta}{1-v_{12}^2} + \frac{125}{(1-v_{\text{core}}^2)} \right]$, $\eta = \frac{E_1}{E_{\text{core}}}$.

Values of factor $m_m$ with $v_{12} = 0.1+0.2$ and $v_{\text{core}} = 0.3+0.4$ are determined according to the diagrams provided in Fig. 9.3-1.

Values of factor $m_t$ are determined according to the diagrams depending on the way in which the plate is supported (refer to Figs. 9.3-2 — 9.3-5), while stiffness characteristics are determined by the formulae specified in this Section.

Value of factor $k$ for Figs. 9.3-2 — 9.3-5 is determined by the formula

$$k = \frac{\pi^2 B_0 h}{G_{\text{core}} b^2},$$

where 

- $B_0 = 2B_1 + \frac{B_{\text{core}}}{1-v_{\text{core}}}$;
- $B_{\text{core}} = \frac{2E_{\text{core}} h^3}{3(1-v_{\text{core}}^2)}$;
- $G_{\text{core}} = \text{shear modulus of the core in the sandwich plate, in Pa}.$".

Figure 31 and references thereto are renumbered 9.3-1.
Figure 9.3-1 (former Figure 31) is replaced by the following one:

![Dependency diagram of factor $m_m$ on ratio of moduli $\eta$ ($v_{12(b)} = 0.1 \div 0.2$ and $v_{\text{core}} = 0.3 \div 0.4$).](image_url)

Fig. 9.3-1

Dependency diagram of factor $m_m$ on ratio of moduli $\eta$ ($v_{12(b)} = 0.1 \div 0.2$ and $v_{\text{core}} = 0.3 \div 0.4$).

Figures 32 — 35 and references thereto are renumbered 9.3-2 — 9.3-5 accordingly.
