Rules for the Classification and Construction of Sea-Going Ships of Russian Maritime Register of Shipping have been approved in accordance with the established approval procedure. The date of coming into force of the present Rules is 1 October 1999.

The Rules are based on the seventh edition taking into account additions and amendments contained in Notice No.1 (1996), Notice No.2 (1997), Notice No.3 (1998) and those developed immediately before publication.

The unified requirements, interpretations and recommendations of the International Association of Classification Societies and the relevant resolutions of the International Maritime Organization have been taken into consideration in the Rules.

The text of the Rules in the Russian language published in 1999 should be considered as the original.
This eighth edition includes, as compared to previous edition (1995), the following additions and amendments:

GENERAL REGULATIONS FOR THE SUPERVISION

1. Chapter 1.1 "Definitions and Explanations". The following definitions have been introduced: "quality system", "nuclear service ship", "docklift ship", "bulk carrier", "pleasure boat"; definition "ship loaded and unloaded in a horizontal direction" and "ferry" are replaced by definitions "roll-on/roll-off ship" "passenger roll-on/roll-off ship"; the definition "ship of river-sea navigation" has been corrected.

2. Chapter 1.2 "Supervision" - additions have been introduced in 1.2.1, 1.2.13.

3. Chapter 1.3 "Rules" - the List of applicable rules and normative documents has been supplemented by the following documents: Rules for the Classification Surveys of Ships, General Regulations for the Supervision of Containers, Management Rules for the Safe Operation of Ships and for Pollution Prevention, Rules for the Quality Management for the Shipping Companies, Rules for the Classification and Construction of High Speed Craft, Rules for the classification and construction of Small-Sized Ramwing Craft of Type A, Requirements for Technical Supervision of Small Sized Ships, Guidelines on Technical Supervision of Marine Nuclear Power Plants in Service, Guidelines for Certification of the Management Systems for the Safe Operation of Ships and for Pollution Prevention, Guidelines on Assessment/Certification of Quality Systems, Rules for the Quality Management for the Crewing Companies; amendments have been introduced in 1.3.2.1; additions have been introduced in 1.3.3.1; amendments have been introduced in 1.3.3.2.

4. Chapter 1.4 "Documents" - amendments have been introduced into 1.4.1, 1.4.7, 1.4.8, 1.4.18.

5. Chapter 1.5 "Responsibilities assumed by the Register" - has been supplemented by the section on the substantive responsibility of the Register.

6. Chapter 2.1 "General provisions" - 2.1.2 has been deleted, additions have been introduced into 2.1.3.

7. Chapter 2.2 "Supervision of materials and articles during manufacture" - amendments have been introduced into 2.2.5.

8. Chapter 2.6 "Control over observation of international conventions and agreements" - amendments have been introduced into 2.6.1, 2.6.4, 2.6.5.3, 2.6.5.8, 2.6.5.12.

RULES FOR THE CLASSIFICATION AND CONSTRUCTION OF SEA-GOING SHIPS

PART 1. CLASSIFICATION

1. Section 1 "General ".
   .1 The concept of classification of ships was formulated on the basis of the IACS Internal Information 8 approved in June 1993.

2. Section 2 "Class of a ship".
   .1 Provisions which clarify the meaning and value of assignment of the Register class to a ship and its renewal, as well as cases and reasons for suspension, withdrawal and cancellation of ship class.

3. Section 3 "Dates of classification and construction of ships and floating structures".
   .1 Additions and supplements have been introduced to the class notation: ОВИМ - equipment of self-propelled one man bridge operated ship; ПЕФ - transport ships intended for carriage of refrigerated cargo in specially equipped cargo spaces and/or in insulated containers and those provided with classified refrigerating plant specially
designed for these purposes; **I1B, I1, I2B, I2, I3B** - marks notifying that a ship carries supplementary systems, equipment and outfit for fire fighting aboard other ships (according to introduction of the requirements to such ships in Part VI "Fire protection" of the present Rules).

3. A new class notation has been introduced for ships and floating structures which due to peculiarities of their construction cannot be assigned with one of the class notations listed in para 2.2.2 above (used upon special decision of the Register, only if a ship is transferred from the class of other IACS Member Society to the Register class).

4. A new system of ice strengthening category marks has been introduced for ice-breakers and transport ships in connection with new requirements set forth in the new Chapter 3.10, Part II "Hull" of the present Rules.

5. Descriptive notations "ferry", "ACV", "SWC", "hydrofoil craft" have been excluded from the Rules due to absence of requirements to ships servicing ferry crossing and revision of definitions of ro-ro ship and ro-ro passenger ship in General Regulations for the Supervision as well as due to publication of the Rules the for Classification and Construction of High-Speed Craft.

6. The table 2.2.5.3 of operation conditions of ships of restricted service **III-** has been refined.

3. Section 3 "Classification surveys of ships in service" has been deleted from the text due to issue of the Rules for the Classification Surveys of Ships (1998) of the Register.

4. Section 4 "Technical documentation of a ship".

1. Lists of design documentation submitted to the Register for review during classification of ship under construction have been refined and complemented.

2. Terminology in documentation headings is brought in accordance with the current standards of the Russian Federation.

5. Section 5 "Classification of refrigerating plants".

1. Additional character letters have been introduced in the class notation of refrigerating plant intended: for: the cooling of cargo in the insulated containers; to maintain the required conditions for the carriage of cargo in gas carriers, chemical tankers, and also if it is additionally equipped with the system regulating the composition of the gas environment in the refrigerated cargo spaces and/or insulated containers. Respective requirements for such refrigerating plants have been introduced in Part XII "Refrigerating plants" of the present Rules.

2. An additional class notation has been assigned to the refrigerating plant built in accordance with the Rules and under the supervision of an IACS Member Society and afterwards classed by the Register, if the plant does not fully comply with the requirements of the Register Rules (applied upon special decision of the Register).

3. Regulations on the refrigerating plans liable to the Register supervision and the refrigerating plants classed by the Register have been refined.

4. It has been instructed to insert into the Register of Ships and the Classification Certificate for Refrigerating Plant additional information on conditions of cargo cooling on board, specified refrigerating temperature of cargo transportation and other information characterizing the refrigerating plant.

5. The table of scope of periodical surveys of classed refrigerating plants has been refined.

6. The list of design documentation submitted to the Register for classification of refrigerating plant has been supplemented.

**PART II. HULL**

1. Requirements to design loads and strength criteria as well as regulation of general requirements to hull structures of sea-going ships, ships of river-sea navigation and ships of restricted area of navigation have been amended and supplemented.

2. Requirements to the collision bulkheads of passenger ships and ventilation trunks of ships of all types have been amended and supplemented in accordance with amendments to regulations II-1/10 and II-1/19 of SOLAS-74.

3. Requirements to the corrosion protection of ballast tanks and other tanks have been introduced in accordance with the regulation 3-2 of a new part A-1, chapter II-1, SOLAS-74.
4. Chapter 3.7 "Fishing vessels and special purpose ships" and Chapter 3.9 "Tugs" have been revised.

5. New requirements to ice strengthening of cargo ships and icebreakers (Chapter 3.10) and to ice strengthening of fishing vessels intended for regular fishery in ice conditions have been introduced.

6. IACS Unified Requirements have been taken into consideration: S11 - buckling strength of hull members; S1 and S1A - strength control during ship loading; S12 - side structures in single side skin bulk carriers.

7. The IACS Unified Requirements have been introduced into the Rules: S14 - testing procedures of watertight compartments; S17 - longitudinal strength of hull girder in flooded condition for single side skin bulk carriers.

8. In accordance with amendments to regulation 7.2, part È, chapter VI of SOLAS-74 the requirements have been introduced in respect of ship stability and strength during loading, unloading and trimming of bulk cargoes other than grain.

9. Chapter 3.2 "Roll-on/roll-off ships" has been revised.

10. Chapter 3.11 "Icebreakers" has been deleted, respective requirements have been set out in Chapter 3.10.

PART III. EQUIPMENT, ARRANGEMENTS AND OUTFIT

1. Chapter 5.7 - amendments and additions have been introduced in respect of design of arrangements for emergency towing. Chapter heading has been changed to "Special arrangements for ships".

2. Chapter 7.4 - has been revised in accordance with the IACS Unified Requirements S8 and S9. Chapter heading has been changed to "Openings in shell plating and their closing appliances"

3. Chapter 7.14 - IACS Unified Requirements S21 have been introduced in respect of design of the cargo hatchways of holds designed for carriage of cargoes in bulk.

4. Chapter 7.15 - in accordance with IMO resolution MSC.27(61), the requirements have been introduced in respect of means of access to the spaces in cargo area of type "A" ships.

5. Chapter 7.16 - additional requirements in respect of construction and closing of holes on the ro-ro passenger ships have been introduced.

6. Chapter 8.3 - requirements in respect of visibility from the navigating bridge have been introduced.

7. Chapter 8.5 - requirements to the construction of inclined or vertical ladders have been revised. Requirements to low lighting on passenger ships capable of carrying more than 36 passengers and on the special purpose ships capable of carrying more than 200 people of special staff have been introduced. Additional requirements to the ways of evacuation on ro-ro passenger ships have been introduced.

8. Ice category marks have been changed in the text according to the new content of para 2.2.3, Part I "Classification".

PART IV. STABILITY

1. Chapter 1.4 - the regulations concerning the Ballast Water Management Plan have been introduced.

2. Chapter 1.5 - a requirement of periodical heeling of fishing vessels in service under certain conditions has been introduced.
3. Chapter 3.4 - requirements have been introduced in respect of stability of liquid cargo ship with broad cargo tanks and to stability of oil tankers of 5000 t gross tonnage and more which construction (or re-equipment) has been contracted after 1 February 1999.

PART V. SUBDIVISION

1. Chapter 1.4 - a requirement in respect of Information on the Effect of Flooding on dry cargo ships which length is less than 80 m has been introduced.

2. Chapter 2.8 - requirements in respect of probability assessment of subdivision of cargo ships which length is 80 m and more have been introduced.

3. Chapter 3.4 - the distance between the emergency waterline from the rooms with emergency electric power supply sources has been stipulated.

4. Chapter 3.5 - requirements have been introduced in respect of possible damage along the ship length for passenger (including for ro-ro passenger) ships with 400 and more people aboard.
For bulk carriers without double side of 150 meters and more length carrying cargoes with density of 1000 kg/m3 and more an additional requirement in respect of draught and stability in damaged condition has been introduced.

5. Chapter 4.3 - requirements to the size of damage of ships with reduced freeboard have been refined.

6. Section 5 - requirements to the ro-ro passenger ships and bulk carriers in service have been introduced.

7. Ice category marks have been changed in the text according to the new content of para 2.2.3, Part I "Classification".

PART VI. FIRE PROTECTION

1. References to IMO resolution MSC.61(67) "Fire Test Procedures Code" have been inserted in the text.

2. Requirements to passenger ships in respect of structural fire protection have been harmonized with IMO resolution MSC.57(67).

3. Chapter 2.8 "Ships carrying dangerous goods" has been harmonized with regulation II-2/54 of SOLAS - 74 and Amendments of IMO resolution MSC.57(67).

4. A new Chapter 2.13 "Ships having a distinguishing mark of provision with means for fire fighting aboard other ships" has been introduced.

5. New requirements to the inert gas systems of double hull and double bottom tankers, to the systems of discharging inert gas from cylinders and to systems with the nitrogen generator have been introduced into Chapter 3.9.

6. Chapter 3.3 "Sprinkler system" has been supplemented by the reference to IMO resolution A.800(19) concerning the systems equivalent to sprinkler system.

7. In Section 4 "Fire detection and alarm systems" requirements of IMO resolution MSC.27(61) have been considered in respect of fire alarm stations.

   2.10 Efficiency of rudders and nozzle rudders .... 223

3 Anchor arrangement .................................. 227
   3.1 General provisions ........................... 227
   3.2 Equipment Number .............................. 227
   3.3 Bower and stream anchors ..................... 231
   3.4 Chain cables and ropes for bower anchors .... 231
   3.5 Chain cable or wire rope for stream anchor 232
   3.6 Anchor appliances ............................. 233
   3.7 Anchor machinery .............................. 234
   3.8 Spare parts .................................... 234

4 Mooring arrangement .................................. 234
   4.1 General provisions ........................... 234
   4.2 Mooring ropes ................................... 234
   4.3 Mooring appliances ............................ 235
   4.4 Mooring machinery ............................. 235

5 Towing arrangement .................................. 235
   5.1 General provisions ........................... 235
   5.2 Tow line ........................................ 236
   5.3 Towing appliances ............................. 236
   5.4 Special arrangement for tugs .................. 236
   5.5 Towing winches ................................. 237
   5.6 Tow line for towing winch ..................... 237
   5.7 Emergency towing arrangements on ships ...... 237

6 Signal masts ........................................ 238
   6.1 General provisions ........................... 238

7 Openings in hull, superstructures and deck-houses and their closing appliances ..... 240
   7.1 General provisions ........................... 240
   7.2 Side scuttles .................................... 241
   7.3 Flush deck scuttles ............................ 243
   7.4 Openings in shell plating and their closing appliances 243
   7.5 Superstructures and deckhouses ............... 246
   7.6 Engine and boiler casings ........................ 247
   7.7 Companion hatches, skylights and ventilating trunks .... 247
   7.8 Ventilators ...................................... 248
   7.9 Manholes ......................................... 249
   7.10 Hatchways of dry cargo holds .................. 249
   7.11 Hatchways of cargo tanks in type "A" ships .... 253
   7.12 Openings in watertight subdivision bulk heads and their closing appliances .... 254
   7.13 Cargo hatchways of holds designed for alternate carriage of dry and liquid cargoes in bulk .... 257
   7.14 Cargo hatchways of holds designed for carriage of cargoes in bulk ........ 258
   7.15 Access to spaces in the cargo area of type "A" ships .......................... 259
   7.16 Additional requirements for openings and their closing appliances in roll-on/roll-off passenger ships .... 259

8 Arrangement and equipment of ship's spaces, various equipment, arrangements and outfit .... 260
   8.1 General provisions ........................... 260
   8.2 Location of spaces ............................ 260
   8.3 Navigating bridge .............................. 260
   8.4 Equipment of dry cargo holds .......................... 261
   8.5 Exits, doors, corridors, stairways and vertical ladders .... 263
   8.6 Guard rails, bulwark and gangways ......... 266
   8.7 Hoisting gear of shipborne barges ............. 267

9 Emergency outfit .................................... 267
   9.1 General provisions ........................... 267
   9.2 Items required ................................. 268
   9.3 Storage of emergency outfit .................... 269
   9.4 Marking ......................................... 270
   9.5 Collision mats ................................... 270
   10 Anchors ......................................... 271
   10.1 Manufacture ....................................... 271
   10.2 Testing ......................................... 271

Appendix. Calculation of the width of stairways forming means of escape on passenger ships and on special purpose ships carrying more than 50 special personnel ........ 273
PART IV. STABILITY

1 General ................................. 276
  1.1 Application .......................... 276
  1.2 Definitions and explanations ....... 276
  1.3 Scope of supervision .................. 277
  1.4 General technical requirements ....... 278
  1.5 Inclining test ........................ 282
  1.6 Departures from the Rules .......... 284
  1.7 Conditions of sufficient stability ... 284
  1.8 Passage of ships from one port to another . 284

2 General requirements for stability .... 285
  2.1 Weather criterion ................. 285
  2.2 Curve of statical stability ......... 286
  2.3 Metacentric height ............... 286
  2.4 Allowance for icing ............... 287

3 Additional requirements for stability 287
  3.1 Passenger ships ................... 287
  3.2 Dry cargo ships ................... 288
  3.3 Timber carriers .................... 289
  3.4 Tankers ............................ 291
  3.5 Fishing vessels .................... 291
  3.6 Special purpose ships .............. 292
  3.7 Tugs .............................. 292
  3.8 Vessels of dredging fleet ........... 293
  3.9 Ships under 24 m in length .......... 295
  3.10 Container ships .................... 297
  3.11 Supply vessels ..................... 297
  3.12 Ships of river-sea navigation ....... 298

4 Requirements for the stability of floating cranes, pontoons, docks and berth-connected ships ...... 299
  4.1 Floating cranes ..................... 299
  4.2 Pontoons ........................... 304
  4.3 Floating docks ...................... 304
  4.4 Berth-connected ships ............... 306

5 Alternative requirements for the stability of ships of unrestricted service . 306
  5.1 General provisions .................. 306
  5.2 Static stability curve .............. 306
  5.3 Metacentric height ............... 307
  5.4 Weather criterion .................. 307

Appendix 1. Instructions on drawing up Information on Stability . 308

Appendix 2. Determination of capsizing moment .......... 312

Table of symbols for the values adopted in Part IV "Stability" .......... 317

PART V. SUBDIVISION

1 General ......................... 319
  1.1 Application ...................... 319
  1.2 Definitions and explanations ....... 319

1.3 Scope of supervision .............. 320
1.4 General technical requirements .... 321
1.5 Satisfactory subdivision .......... 322

2 Probability estimation of subdivision .... 322
  2.1 Floodable length ............... 322
  2.2 Permeability ..................... 323
  2.3 Subdivision index ............... 323
  2.4 Compartment flooding probability . 324
  2.5 Probability of ship's survival after damage of a compartment or a group of adjacent compartments . 325
  2.6 Special requirements for subdivision . 327

2.7 Probabilistic estimation of subdivision in ships with the ice marks LY4, LY5, LY6, LY7, LY8 and LY9 in the class notation ... 328

3 Damage stability ................... 332
  3.1 General ........................... 332
  3.2 Extent of damage ................. 332
  3.3 Permeability ..................... 332
  3.4 Requirements for damage stability characteristics .......... 333
  3.5 Additional requirements for damage stability ........... 334

4 Special requirements for type "B" ships with reduced freeboard and for type "A" ships ...... 339
  4.1 General ........................... 339
  4.2 Trim and loading condition of the ship prior to damage .... 339
  4.3 Extent of damage .................. 340
  4.4 Stability and trim of a ship in damaged condition ....... 341

5 Requirements for ships in service .... 342
  5.1 Requirements for roll-on/roll-off passenger ships (ro-ro passenger ships) .......... 342
  5.2 Bulk carriers ..................... 343

Appendix. Formulas for determining the values of p for different compartment arrangements (para 2.6.4.2) .......... 345

PART VI. FIRE PROTECTION

1 General ......................... 349
  1.1 Application ...................... 349
  1.2 Definitions and explanations ....... 349

1.3 Scope of supervision .............. 351
1.4 Fire plans ........................ 351
1.5 Categories of ship's spaces ......... 352
1.6 Subdivision of materials according to combustibility, flame spread and ignitability ........ 353

2 Structural fire protection .......... 354
  2.1 General requirements ............. 354

1 GENERAL

1.1 DEFINITIONS AND EXPLANATIONS

For the purpose of the Rules of Russian Maritime Register of Shipping\footnote{Hereinafter referred to as "the Register".} the following definitions have been adopted unless expressly provided otherwise in other Parts:

A cargo ship is any ship which is not a passenger ship (dry cargo ship, tanker, refrigerating transport ship, icebreaker, tug, pusher, salvage ship, vessel of dredging fleet, cable layer, special purpose ship and other non-passenger ship).

Place of refuge is any naturally or artificially sheltered aquatorium which may be used as a shelter by a ship under conditions likely to endanger the safety of the ship.

A passenger is every person other than the master and the members of the crew or other persons employed or engaged in any capacity on board a ship (special personnel) on the business of that ship, and a child under one year of age.

A passenger ship is a ship intended for or carrying more than 12 passengers.

A fishing vessel is a vessel used directly for catching or for catching and processing the catch (fish, whales, seals, walrus or other living resources of the sea).

Crew of a fishing vessel means persons engaged in any business on board a ship connected with its purpose.

Special personnel means all persons who are not passengers or members of the crew and who are carried on board in connection with the special purpose of that ship or because of special work being carried out aboard that ship.

A special purpose ship is a mechanically self-propelled ship which by reason of its function carries on board more than 12 persons of special personnel including passengers (by these ships are meant research, expeditionary, hydrographic, training ships; whale and fish factory ships and other ships engaged in processing of living resources of the sea and not engaged in catching, and the like ships).

Crew is the ship's personnel ensuring control, propulsion, endurance and safe operation of the ship. Personnel serving these persons and the passengers is also included in the crew.

Container means an article of transport equipment:

of a permanent character and accordingly strong enough to be suitable for repeated use;

specially designed to facilitate the transport of goods by one or more modes of transport without intermediate reloading;

designed to be secured and/or readily handled, and having corner fittings for these purposes;

of a size such that the area enclosed by the four outer bottom corners is at least 14 or 7 m² if it is fitted with top corner fittings.

Note. The term "container" includes neither vehicles, nor packaging; however, containers when carried on chassis are included.

A container ship is a ship intended for the carriage of goods in containers of the international standard and provided with the cellular guides in the holds.

A roll-on/roll-off ship is a ship specially designed for transportation of various wheeled vehicles (cars, rolling stock, tracked vehicles, trailers with and without cargo), in which the cargo loading operations are performed preferably in a horizontal direction - by a roll-on/roll-off.

A roll-on/roll-off passenger ship (ro-ro passenger ship) is a passenger ship with enclosed or open cargo spaces which is loaded/unloaded in the horizontal direction, or with special category spaces defined in para 1.5.9, Part VI "Fire Protection" of the Rules.

Classed among passenger ro-ro ships are also those ships loaded/unloaded in the horizontal direction which regularly carry passengers and which carry vehicles with fuel in their tanks and/or railway carriages on open decks at ferry crossings.

Docklift ship is a dry cargo ship adapted to carry out cargo handling operations using the docking principle in ports and protected water areas.

A tanker is a ship intended for the carriage of liquid cargoes in bulk, including:

an oil tanker is a ship intended for the carriage in bulk of crude oil and petroleum products having a flash point 60°C and below for sea-going ships, 55°C and below for ships of inland navigation, Reid vapour pressure being below atmospheric pressure;

an oil tanker (>60°C) is a sea-going ship intended for the carriage in bulk of petroleum products having a flash point over 60°C;

an oil tanker (>55°C) is a ship of inland navigation intended for the carriage in bulk of petroleum products having a flash point over 55°C;

an oil recovery vessel means a vessel used constantly or periodically for recovery petro-
leum products having a flash point 60°C and below from the sea surface.

Depending on the scope of the fulfilled requirements of these Rules the vessels used for operations connected with recovery of oil spillage at the sea surface can perform their operation being at a distance safe in respect of fire or explosion from the object where an oil spillage occurred or in the immediate vicinity from an oil spillage source in oil covered waters;

a g a s c a r r i e r is a ship intended for the carriage of liquefied gases in bulk;

a c h e m i c a l t a n k e r is a ship intended for the carriage of dangerous chemicals in bulk.

A c o m b i n a t i o n c a r r i e r is a ship intended for the carriage of crude oil and petroleum products in bulk, as well as bulk cargoes (by these ships are meant ore/oil carriers, oil/bulk dry cargo carriers and similar ships).

A b u l k c a r r i e r is a one deck ship with topside and hopper-side tanks in cargo spaces which is primarily intended for the carriage of bulk cargoes.

A s h i p b o r n e b a r g e is a non-self-propelled cargo ship unmanned and appropriated for transportation in specially equipped ships (barge carriers) and for towing (pushing) within the specified restricted area of navigation.

D e a d w e i g h t means the difference between the displacement of a ship at the load waterline corresponding to the summer freeboard assigned for the water with a density of 1,025 t/m³ and the displacement of a light ship.

D i s p l a c e m e n t of a l i g h t s h i p means the displacement of a ship without cargo, fuel oil, lubricating oil, ballast, fresh and boiler feed water in its tanks, ship stores, passengers, crew and their effects.

A t u g is a ship specially intended for the towage and pushing of other ships and floating facilities.

A f l o a t i n g c r a n e is a crane structure on a floating hull of pontoon or other similar in shape type, intended for cargo handling operations; it may be used for the carriage of cargoes on the deck.

A c r a n e s h i p is a ship, carrying crane structure, intended for cargo handling operations including mounting, undersea and pipelaying operations etc.

A d r y c a r g o s h i p is a ship intended for the carriage of different cargoes (general cargoes, containers, timber, bulk cargoes, etc.), except for the liquid bulk cargoes.

A s u p p l y v e s s e l is a vessel designed basically for the carriage of supplies and cargoes to the mobile and fixed offshore units intended for the different purposes, and fitted generally with a forward superstructure and an after weather cargo deck for processing of the cargo at sea. The ship may be used for towing operations provided the appropriate requirements of the Rules of the Register are complied with.

A m o b i l e o f f s h o r e d r i l l i n g u n i t is a ship (floating structure) designed to be engaged in drilling operations for the exploration and/or exploitation of resources beneath the sea-bed.

A s h i p of r i v e r - s e a n a v i g a t i o n is a self-propelled cargo ship intended for the carriage of cargoes by sea and by inland waterways.

D y n a m i c a l l y s u p p o r t e d c r a f t means a craft the weight of which, or a significant part thereof, is balanced in one mode of operation by other than hydrostatic forces.

H i g h - s p e e d c r a f t is a ship capable to make a maximum speed in meters per second equal to or exceeding:

$$3.7 \times \Delta^{0.167},$$

where \( \Delta \) is displacement equal to design waterline, m³.

A b e r t h - c o n n e c t e d s h i p is a non-self-propelled floating structure, having the pontoon-type or ship-type hull, which is usually in operation at the quay wall (shore). These ships include floating hotels and hostels, floating workshops, floating power plants, floating warehouses, floating docks, etc.

For the purpose of these Rules the following explanations have been adopted:

A n u c l e a r s h i p is a ship provided with a main propulsion plant using nuclear energy.

A n u c l e a r s e r v i c e s h i p (N S - s h i p) is a cargo ship intended for the storage of new and spent fuel assemblies of the nuclear reactors, unloading spent and loading new fuel assemblies into reactor vessels, as well as for reception, storage, processing and disposal of liquid and solid radioactive waste or performing other duties associated with technological servicing of nuclear propulsion ships.

A p l e a s u r e b o a t is a ship intended for pleasure purposes only (no commercial use) with at most 12 people onboard. Definition concerning specific types of ships are stated in appropriate rules.

A d d i t i o n a l r e q u i r e m e n t s are the requirements not provided for by the Rules, imposed by the Register in carrying out the supervision.

A n a r t i c l e is machinery, arrangement, boiler and pressure vessel, apparatus, instrument, item of equipment and outfit to which the requirements of the Rules are applicable.

R u l e s means the Rules listed in 1.3.1.

Q u a l i t y s y s t e m means organizational structure, procedures, processes and resources needed to implement quality management.

S t a n d a r d s, as applied to the Rules, means all kinds of standards or the regulating and technical documents of all countries approved or recognized by the Register.
A ship under construction is a ship during a period from the date of laying the keel till the date of issuing the documents for a ship. The date of laying the keel means the beginning of construction identifiable with a specific ship when the mass of the assembled part of a hull comprises not less than 50 tons or 1 per cent of the estimated mass of all structural material, whichever is less.

A ship in service is a ship which is not under construction.

1.2 SUPERVISION

1.2.1 The Register is the state organ of the technical supervision and classification of merchant ships. Being a member of the International Association of Classification Societies (IACS), the Register follows IACS decisions and the provisions of IACS Code of Ethics. The Register’s Quality System complies with the IACS Quality System Certification Scheme and applicable requirements of ISO standard 9001 that is confirmed by IACS Certificate issued on the basis of results of the appropriate audits. Besides, the Register duly authorized by the Government of the Russian Federation1 or on behalf of the Governments of other countries exercises technical supervision covered by its terms of reference of the implementation of requirements of the international conventions, agreements and treaties to which the countries mentioned are parties.

1.2.2 The Register sets forth technical requirements for safety of navigation of sea-going ships in accordance with the ship’s purpose, safety of life at sea, proper transportation of cargoes at sea and inland waterways, prevention of pollution from ships, exercises technical supervision of the implementation of these requirements and classifies ships, certifies the gross and net tonnages of sea-going ships and the measurement characteristics of ships of inland navigation being under the Register supervision, determined based on ship measurement.

1.2.3 The supervision is based on the Rules issued by the Register and has for its object to determine whether ships and containers liable to supervision as well as materials and articles intended for construction and repair of ships and their equipment comply with the Rules and Additional Requirements. The Rules and Additional Requirements are obligatory for application and implementation by design offices, shipowners, container owners, shipyards, also by those enterprises, which produce materials and articles subject to supervision of the Register.

Interpretation of the Rules requirements and other regulating documents of the Register is within the Register competence only.

The supervision of the Register does not preclude the functioning of technical inspection bodies of shipowners, shipyards and manufacturers.

1.2.4 The Register supervises the following sea-going ships and ships of inland navigation subject to its supervision, under construction and in service:

.1 passenger ships, tankers, ships intended for the carriage of dangerous cargoes as well as tugs regardless of the main machinery power and gross tonnage;

.2 all self-propelled ships not specified in 1.2.4.1 with main machinery power of 55 kW and upwards;

.3 ships not specified in 1.2.4.1 and 1.2.4.2 of 80 gross tonnage and upwards or with a total primary engine power of 100 kW and upwards.

1.2.5 The Register supervises ship refrigerating plants from the point of view of ship’s safety, proper transportation of cargoes, prevention of ozone-destructive effect of refrigerating agents on the environment and classifies ship refrigerating plants.

1.2.6 The Register supervises ship cargo handling gears of 1 ton lifting capacity and over.

1.2.7 Upon special agreement, the Register may supervise other ships, installations and arrangements not specified in 1.2.4 to 1.2.6.

1.2.8 The technological and special gears of fishing vessels, cable layers, vessels of dredging fleet and special purpose ships are not subject to supervision of the Register, except for the equipment specified in the appropriate parts of the Rules.

1.2.9 The Register exercises supervision of containers during their manufacture and service.

1.2.10 The Register considers and approves draft standards and other regulating documents related to its activities.

1.2.11 The Register may undertake examinations as well as take part in examinations of technical issues related to its activities.

1.2.12 The Register issues the Register of Ships which contains the particulars of self-propelled sea-going ships of 100 gross tonnage and above classed with the Register.

1.2.13 The fees for the performed work are charged by the Register according to the scales of fees. If the commitments to the Register, including commitments on payment for its services fail to be performed or are improperly performed, the Register is entitled not to assign a class or, where a class has already been assigned, to suspend or withdraw the class from the ship for which the commitments to the Register, including commitments on payment for its services, failed to be performed or were improperly performed, and to withdraw (to make an entry

1 Hereinafter referred to as "RF"
indicating cessation of the validity) the documents issued by the Register.

1.3 RULES

1.3.1 Rules to be applied.

1.3.1.1 In carrying out the supervision the Register applies the following Rules:

.1 General Regulations for the Supervision;
.2 Rules for the Classification and Construction of Sea-Going Ships consisting of the following parts:
   I - Classification,
   II - Hull,
   III - Equipment, Arrangements and Outfit,
   IV - Stability,
   V - Subdivision,
   VI - Fire Protection,
   VII - Machinery Installations,
   VIII - Systems and Piping,
   IX - Machinery,
   X - Boilers, Heat Exchangers and Pressure Vessels,
   XI - Electrical Equipment,
   XII - Refrigerating Plants,
   XIII - Materials,
   XIV - Welding,
   XV - Automation,
   XVI - Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats;

.3 Rules for the Equipment of Sea-Going Ships consisting of the following parts:
   I - Supervision Regulations,
   II - Life-Saving Appliances,
   III - Signal Means,
   IV - Radio Equipment,
   V - Navigational Equipment;

.4 Load Line Rules for Sea-Going Ships;
.5 Rules for the Cargo Handling Gear of Sea-Going Ships;
.6 Rules for the Classification Surveys of Ships;
.7 Rules for the Classification and Construction of Ships of Inland Navigation (for the Danube);
.8 General Regulations for the Supervision of Containers;
.9 Rules for the Construction of Containers consisting of the following parts:
   I - General Provisions,
   II - General Cargo Containers,
   III - Thermal Containers,
   IV - Tank Containers,
   V - Platform Containers,
   VI - Bulk Containers;

.10 Rules for the Approval of Containers for the Transport of Goods under Customs Seal;

.11 Rules for the Classification and Construction of Mobile Offshore Drilling Units consisting of the following parts:
   I - Classification,
   II - Hull,
   III - Equipment, Arrangements and Outfit,
   IV - Stability,
   V - Subdivision,
   VI - Fire Protection,
   VII - Machinery Installations,
   VIII - Electrical Equipment,
   IX - Materials,
   X - Welding;

.12 Rules for the Convention Equipment of Mobile Offshore Drilling Units consisting of the following parts:
   I - Life-Saving Appliances,
   II - Signal Means,
   III - Radio Equipment,
   IV - Navigational Equipment;

.13 Rules for the Prevention of Pollution from Ships consisting of the following parts:
   I - Supervision Regulations,
   II - Requirements for Ship’s Construction and Equipment for the Prevention of Pollution by Oil,
   III - Requirements for Ship’s Construction and Equipment for the Prevention of Pollution by Noxious Liquid Substances in Bulk,
   IV - Requirements for Ship’s Equipment and Arrangements for the Prevention of Pollution by Sewage,
   V - Requirements for Ship’s Equipment and Arrangements for the Prevention of Pollution by Garbage;

.14 Rules for the Classification and Construction of Chemical Tankers;
.15 Rules for Safety of Dynamically Supported Craft;

.16 Rules for the Classification and Construction of Nuclear Ships;

.17 Rules for the Classification and Construction of Nuclear Service Ships;
.18 Rules for the Classification and Construction of Gas Carriers;
.19 Rules for the Classification and Construction of Manned Submersibles and Diving Systems;
.20 Management Rules for the Safe Operation of Ships and for Pollution Prevention;
.21 Rules for the Quality Management for the Shipping Companies;
.22 Rules for the Quality Management for the Crewing Companies;
.23 Rules for the Classification and Construction of High-Speed Craft;
.24 Rules for the Classification and Construction of Small-Sized Ramwing Craft of Type A;
.25 Rules for the Carriage of Grain.
1.3.1.2 In addition to the Rules specified in 1.3.1.1, the Register also applies the following Rules and other regulating documents for the supervision:
.1 Rules for the Construction of Sea-Going Reinforced Concrete and Composite Ships and Floating Docks;
.2 Rules for the Tonnage Measurement of Sea-Going Ships;
.4 Rules for the Measurement of Vessels for the Panama Canal, Rules for the Tonnage Measurement for the Suez Canal;
.5 Guidelines on Technical Supervision of Ships in Service;
.6 Guidelines on Technical Supervision during Construction of Ships and Manufacture of Materials and Equipment;
.7 Rules of the RF Register of Inland Waterways (1989) or other regulating documents recognized by the Register;
.8 Guidelines on Technical Supervision during Construction of Containers;
.9 Guidelines on Technical Supervision of Containers in Service;
.10 Guidelines on Technical Supervision of Mobile Offshore Drilling Units in Service;
.11 Guidelines on Technical Supervision of Mobile Offshore Drilling Units Construction and Manufacture of Materials and Equipment;
.12 Guidelines on Technical Supervision of Manned Submersibles, Diving Systems and Manufacture of Materials and Equipment;
.13 Guidelines on Technical Supervision of Manned Submersibles and Diving Systems in Service;
.14 Technical Requirements for the Stowage and Securing of International Standard Containers Aboard Ships Adapted for their Carriage;
.15 Requirements for Technical Supervision of Small Ships;
.16 Guidelines on Technical Supervision of Nuclear Ships Construction;
.17 Guidelines on Technical Supervision of Marine Nuclear Power Plants in Service;
.18 Guidelines on Assessment/Certification of Quality Systems;
.19 Guidelines for Certification of the Management Systems for the Safe Operation of Ships and for Pollution Prevention.

1.3.2 Application of the Rules to ships under construction, containers and articles.

1.3.2.1 Newly adopted Rules and amendments thereto shall come into force on the date stated in the annotation on the back of the title-page. The Rules are to be considered as recommendations until they come into force.
1.3.2.2 Ships and articles whose designs are submitted to the Register for approval after the date of coming into force of the Rules or amendments thereto shall comply with the requirements of these Rules and amendments. To ships under construction and articles whose technical documentation was approved by the Register before coming into force of the Rules, those Rules are applicable which were in force at the time of approval of this documentation (see also 3.2).

1.3.3 Application of the Rules to ships and containers in service.
1.3.3.1 Ships and containers in service shall comply with the requirements of those Rules to which a ship or a container was constructed, unless subsequent editions of the Rules or circular instructions of the Register published after the issue of the Rules contain other directions. Ships in service which are classed by the Register for the first time come under the requirements of the Register Rules that were in force at the time of the ship construction, with due regard to the requirements of the later editions of the Rules and to instructions contained in the Register circulars as far as applicable to ships in service.
1.3.3.2 The applicability of the latest edition of the Rules to ships and containers in service, where these are reconstructed after damage or under similar circumstances, as well as converted, is established by the Register on the case-to-case basis as far as it is practicable and technically reasonable.

1.3.4 Variations from the Rules.
1.3.4.1 The Register may allow any materials, structures of a ship and a container or individual arrangements and articles to be fitted in a ship and a container other than those required by the Rules, provided that they are as effective as those specified by the Rules; as regards ships and containers subject to the provisions of the international conventions or agreements, such variations from the Rules may only be allowed by the Register if they are also allowable under those conventions and agreements.

In the above-mentioned cases the Register shall be supplied with the particulars of the variations which would enable it to ascertain that such materials, structures and articles meet the requirements which ensure safety of the ship, safety of life at sea, safety of cargo transportation by sea and by inland waterways and prevention of pollution from ships.
1.3.4.2 If the structure of a ship, her machinery, arrangements, installations, equipment and outfit or
materials used cannot be recognized as being adequately verified in service, the Register may require special tests to be held during construction and, in the case of a ship in service, may reduce terms between periodical surveys, or extend the scope of these surveys.

All mentioned above refers also to containers. If the Register finds it necessary, appropriate restrictive entries may be made in the classification or other documents issued by the Register and in the Register Book. These restrictions are lifted after positive results have been obtained in the course of service.

1.4 DOCUMENTS

1.4.1 As a result of supervision the Register issues appropriate documents.

Instructions in respect of issue of the Register documents are set out in the List of the RS Documents Issued During Technical Supervision.

1.4.2 The documents which confirm the compliance with the requirements of the Rules for the Classification and Construction of Sea-Going Ships and Rules for the Classification and Construction of the Particular Types of Ships as well as the Rules for the Classification and Construction of Ships of Inland Navigation are as follows:

- Classification Certificate;
- Classification Certificate for the Refrigerating Plant.

1.4.3 The document which confirms the compliance with the requirements of the Rules for the Convention Equipment of Sea-Going Ships and Rules for the Convention Equipment of the Particular Types of Ships is an Equipment Certificate.

1.4.4 The document issued to the ships not engaged on international voyages, which confirms the compliance with the requirements of the Load Line Rules for Sea-Going Ships is a Load Line Certificate. Provisions on the issue of this Certificate are given in the above Rules.

The document issued to the ships engaged on international voyages, which confirms the compliance with the requirements of the Load Line Rules for Sea-Going Ships is the International Load Line Certificate or the International Load Line Exemption Certificate. Provisions on the issue of these Certificates are given under 2.6.

1.4.5 The documents which certify the seaworthiness of a ship are as follows:

- Passenger Certificate which is issued to seagoing passenger ships;
- Seaworthiness Certificate which is issued to sea-going self-propelled ships of 100 gross tonnage and upwards, if a ship is granted the documents referred to in 1.4.2.1, 1.4.3, 1.4.4, 1.4.18 as well as in 1.4.5.1 for the passenger ships.

The Seaworthiness Certificate is issued to all ships of inland navigation, sea-going, non-self-propelled ships as well as sea-going self-propelled ships of less than 100 gross tonnage if a ship is granted the documents referred to in 1.4.2.1, 1.4.4, 1.4.18 as well as in 1.4.5.1 for the passenger ships.

The documents specified in 1.4.2, 1.4.3, 1.4.5 are issued for a period of five years and are to be confirmed annually within three months either way of the anniversary date of issuing the Certificate.

1.4.6 The document which allows a single passage between certain ports issued to a non-classed ships, a ship whose class has been withdrawn, or a ship which had no right to navigate in a particular area, provided special instructions of the Register have been fulfilled and observed, is a Sailing Permit for Single Passage.

1.4.7 The documents which confirm the compliance with the requirements of Rules for the Cargo Handling Gear of Sea-Going Ships are as follows:

- Register Book of Ship’s Cargo Handling Appliances which is issued to ship’s cargo handling appliances covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Book is 10 years;
- Certificate of Test and Thorough Examination of Cargo Handling Appliances which is issued to ship’s cargo handling appliances covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Certificate is 5 years;
- Certificate of Test and Thorough Examination of Derrick Used in Union Purchase which is issued to ship’s cargo derricks covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Certificate is 5 years;
- Certificate of Test and Thorough Examination of Interchangeable and Removable Components, which is issued to removable and interchangeable components forming part of cargo handling gear and loose gear covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Certificate is not limited and depends on the technical condition of components;
- Certificate of Test and Thorough Examination of Steel Rope which is issued to steel ropes covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Certificate is not limited and depends on the technical condition of the steel rope;
- Certificate of Test and Thorough Examination of Lifts which is issued to ship’s lifts covered by Rules for the Cargo Handling Gear of Sea-Going Ships. Duration of the Certificate is 5 years.

1.4.8 The documents which confirm the compliance of the type material, article, container or type
production process with the requirements of the Register are as follows:

1. Type Approval Certificates;
2. Approval Certificates.

The documents which confirm the compliance of materials, articles and containers manufactured under the supervision of the Register with the provisions of the Rules and Additional Requirements of the Register are the Certificates of the Register or Type Approval Certificates for the certain types of materials or articles.

1.4.9 When authorized under the provisions of the international conventions and agreements, the Register issues relevant Certificates to ships in the manner provided for by these conventions and agreements (see 2.6).

1.4.10 In the course of supervision of the ships the Register issues, if necessary, other documents (reports, records, messages, log books, etc.) as well as documents not covered by the present Chapter.

1.4.11 The Register issues the documents on the basis of satisfactory assessment results of technical condition of a supervised object, obtained in the course of supervision, surveys and trials.

1.4.12 The Register may recognize fully or partially the documents of other classification societies, technical inspection bodies and other organizations.

1.4.13 The documents issued by the Register to a ship shall be kept on board the ship.

1.4.14 A Seaworthiness Certificate and other relevant documents of the Register which confirm the compliance with the requirements of the Rules for the Classification and Construction of Sea-Going Ships, Rules for the Convention Equipment of Sea-Going Ships, Rules for the Prevention of Pollution from Ships and Rules for the Classification and Construction of Ships of Inland Navigation (see 1.4.2 and 1.4.3) cease to be valid in the following cases:

1. Expiry of terms;
2. if a ship, her machinery, arrangements, equipment and outfit have not been subjected to a periodical survey in due time;
3. after an accident unless the ship is submitted for a survey in a port where the accident took place or in the first port she calls after an accident;
4. after carrying out changes in the outfit as well as repair or conversion at the shiprepairing yards without the Register supervision of the parts of a ship covered by the requirements of the Rules;
5. if a ship is not maintained in an appropriate technical condition ensuring her safety;
6. violation of purpose and the navigation conditions stated in the documents issued to the ship;
7. if conditions or instructions of the Register have not been complied with.

1.4.15 The conditions of losing validity of the Register’s documents on the load lines, cargo handling gear and containers are stated in the relevant Rules.

1.4.16 The Register can renew the validity of documents if the reasons of losing this validity are eliminated.

1.4.17 The documents which confirm the compliance with the requirements of the Rules for the Prevention of Pollution from Ships in oil tankers of less than 150 gross tonnage, in ships of less than 400 gross tonnage other than oil tankers as well as in any ships not engaged on the international voyages are Certificates for the Prevention of Pollution by Oil, Sewage and Garbage.

1.4.18 The documents which confirm the compliance with the requirements of the Rules and regulating documents for the tonnage measurement of ships are as follows:

1. International Tonnage Certificate (1969) (see Chapter 2.6);
2. Tonnage Certificates for the ships not covered by the International Convention on Tonnage Measurement of Ships, 1969. Provisions on the issue of these documents are given in Rules for the Tonnage Measurement of Sea-Going Ships, 1996;
3. Tonnage Certificate for a Ship of Inland Navigation (see Chapter 2.6);
4. Special Tonnage Certificate for the Suez Canal (form 1.2.6) for the ships passing the Suez Canal;
5. PC/UMS Documentation of Total Volume (Panama Canal) for the ships passing the Panama Canal for the first time. This document is a tentative one based on which the Commission of Panama Canal issues the Tonnage Certificate for the Panama Canal.

1.5 RESPONSIBILITIES ASSUMED BY THE REGISTER

1.5.1 The Register entrusts carrying out inspections to experts adequately skilled in their particular fields of action and performing their duties with diligence and application.

The Register is responsible for failure to perform or for improper performance of its commitments which results only from its guilt (intent or carelessness).

The Register covers losses to persons entering with it into contractual relations associated with the present Rules who have suffered losses originating from its failure to perform or improper performance
of its contractual commitments due to carelessness, in
the amount not exceeding the fees under contract
according to the scales of fees and (or) the Register’s
invoice(s) paid or submitted to payment, and only in

2 TECHNICAL SUPERVISION

2.1 GENERAL PROVISIONS

2.1.1 The technical supervision and classification
cover:
.1 consideration and approval of technical
documentation;
.2 supervision during manufacture of materials
and articles provided for by the Rules, intended for
use in construction and repairing of supervised
ships;
.3 supervision during construction, reconstruc-
tion or conversion of ships as well as during
manufacture of containers;
.4 surveys of ships in service;
.5 assignment, renewal and recovery of a class,
making of appropriate entries in the Register Book
and issue of the Register documents.

2.1.2 For the supervision to be carried out, the
shipowners, container owners, administration of
shipyards, manufacturers and other enterprises shall
ensure that the representatives of the Register all
afforded the possibility of conducting surveys of
ships and containers, free access to all places where
materials or articles subject to supervision of the
Register are manufactured and tested, and shall
provide all conditions for the supervision to be
performed.

If necessary, the Register may require to provide
the access to the supervised objects as well as the
conditions for performing the work by the Register
surveyors together with the IACS auditors when the
latter conduct the audit of the Register’s quality
system.

2.1.3 The shipowners, container owners, ship-
yards, design offices and manufacturers shall fulfil
the requirements imposed by the Register or the
surveyors to the Register when they are in the course
of their duty.

2.1.4 Any alterations relating to the materials and
the structural design of the ship, containers and
articles to which the requirements of the Rules apply,
planned by the shipowners, shipyards, designing
organizations and manufacturers shall be approved
by the Register before they are made.

2.1.5 Controversial issues arising in the course of
supervision may be transferred by the shipowners,
container owners, shipyards, manufacturers and
other plants directly to the higher Register Inspecto-
rates. The judgement of the Register Head Office is
final.

2.1.6 The Register may refuse from the super-
vision if a shipyard or manufacturer systematically
violates the Rules, or if the other party to a
Supervision Contract violates it.

2.1.7 In case a defect has been revealed in a
material or article which holds a valid document, the
Register may require additional test or appropriate
corrections to be made, and if the defect cannot be
remedied, may cancel this document.

2.2 SUPERVISION OF MATERIALS AND ARTICLES
DURING MANUFACTURE

2.2.1 Relevant parts of the Rules contain lists of
materials and articles manufacture of which shall be
performed under the Register supervision as well as
technological processes specified by the Register.

By special Agreement the Register may exercise
supervision also of materials and articles not
contained in the above-mentioned lists.

2.2.2 Manufacture of materials and articles subject
to the Register supervision shall comply with the
technical documentation approved by the Register.

2.2.3 In the course of supervision the Register
may supervise the compliance with the structural,
technological and production standards and pro-
cesses which are not regulated by the Rules, but have
an effect on the fulfilment of the Rules requirements.

2.2.4 Materials, articles or technological pro-
cesses which are novel or submitted to the Register
for the first time and subject to the Register super-
vision before being applied in the construction and
repair of ships, production of materials and articles
shall be approved by the Register. For this purpose
after approval of the technical documentation by the
Register, the material specimens, articles or new
technological processes shall be tested within a scope
agreed with the Register.

2.2.5 Register supervision during manufacture of
materials and articles is performed by its surveyors or
may be entrusted to other classification organization
in accordance with the Agreement on mutual
substitution.
2.2.6 In the cases specified by the Register the manufacturing works is to be surveyed by the Register to inspect the facilities for manufacturing materials and articles which comply with the Register requirements.

2.2.7 In the process of supervision during manufacture materials and articles shall be subjected to the required surveys and tests according to the procedure and within the scope prescribed by the Register.

2.2.8 Materials and articles manufactured under the Register supervision shall be provided with the documents specified by the Register and, if required, the brands confirming its supervision during their manufacture, as well as the marking enabling to determine their compliance with the documents.

2.2.9 In justified cases the Register may establish special conditions of application of separate articles.

2.3 SUPERVISION OF SHIPS UNDER CONSTRUCTION, RECONSTRUCTION AND CONVERSION

2.3.1 Supervision of ships under construction, reconstruction or conversion is effected by surveyors to the Register on the basis of the technical documentation approved by the Register. The scope of surveys, measurements and tests run in the course of supervision is determined by the Register which relies on the instructions in force with due regard for particular circumstances.

2.4 SURVEYS OF SHIPS AND CONTAINERS IN SERVICE

2.4.1 The shipowners and container owners shall observe the terms of periodical and other surveys prescribed by the Register, and prepare the ship or container for a survey in the appropriate way and also inform the Register without delay of all accidents and repairs related to the hull of a ship or articles covered by the requirements of the Rules, that occurred within the interval between the surveys.

2.4.2 If new articles are fitted in a ship in service which are liable to the requirements of the Rules, provisions specified in 2.2 and 2.3 are applied to these articles.

2.4.3 When replacing defective or extremely worn-out parts subject to the requirements of the Rules with new ones, the latter shall be manufactured in compliance with the requirements of these Rules (with due regard to 1.3.3) and have an approval by the Register.

2.5 SURVEY OF SHIPS IN FOREIGN PORTS

2.5.1 In a port where there is no representative of the Register, while a necessity arises to subject a ship to a survey, the master of the ship or a shipowner’s representative shall:

1. in case of renewal extension or confirmation of validity of the documents issued in compliance with the requirements of the international conventions and agreements, take steps provided for in 2.6;

2. in case of renewal, extension or confirmation of validity of the documents for cargo handling machinery and gear and Seaworthiness Certificate of a ship, take steps set forth in special provisions;

3. in case of renewal, extension or confirmation of validity of classification documents or obtaining an expert statement in connection with the classification of a ship or its refrigerating plant, apply to:

3.1 representatives of classification societies authorized by the Register to act on its behalf;

3.2 non-exclusive surveyors to the Register.

2.6 CONTROL OVER OBSERVATION OF INTERNATIONAL CONVENTIONS AND AGREEMENTS

2.6.1 General provisions.

The requirements of the following international conventions and agreements are taken into account in the relevant parts of the Rules:

- International Convention on Load Lines, 1966;
- International Convention on Tonnage Measurement, 1969;
- International Convention on Occupancy Safety and Health (Dock Work), 1979 (ILO-152);
- International Convention for Safe Containers, 1972;
- International Convention for the Transport of Goods under Customs Seal, 1972;
- Shipping Regulations for the Danube, 1975;
- Convention on Tonnage Measurement of Ships of Inland Navigation, 1966, etc;
- International Regulations for Preventing Collisions at Sea, 1972;
of Safety for High-Speed Craft, IMO Code for the Construction and Equipment of Mobile Offshore Drilling Units, IMO Code of Safety for Special Purpose Ships;
IMD Code of Safety for Diving Systems;
Inter-Governmental Agreements in force on Load Lines.

The provisions of the above conventions and agreements are applicable to ships engaged on international voyages.

2.6.2 Definitions.
For the purpose of the provisions of this Chapter relating to the international conventions and agreements except for the International Convention for the Prevention of Pollution from Ships, 1973, and the Protocol of 1978 relating thereto the following definitions have been adopted:

1 New ship means a ship the keel of which is laid or which is at a similar stage of construction on or after the date of coming into force of the appropriate international convention;

2 Existing ship means a ship which is not a new ship;

3 International voyage means a sea voyage from a country to which the Conventions apply to a port outside such country, or conversely.

2.6.3 Exceptions.

2.6.3.1 The provisions of the International Convention for the Safety of Life at Sea, 1974, the Protocol of 1978 relating thereto and Amendments 1981, 1983, 1988, 1989, and 1990 do not apply to the following ships subject to the supervision of the Register unless expressly provided otherwise:

1 cargo ships of less than 500 gross tonnage;

2 ships not propelled by mechanical means;

3 wooden ships of primitive build;

4 pleasure yachts not engaged in trade;

5 fishing vessels.

2.6.3.2 The provisions of the International Convention on Load Lines, 1966, do not apply to the following ships subject to the supervision of the Register:

1 new ships of less than 24 m in length;

2 existing ships of less than 150 gross tonnage;

3 pleasure yachts not engaged in trade;

4 fishing vessels;

5 ships navigating in the Caspian Sea.

2.6.3.3 Provisions of Annex IV to the International Convention for the Prevention of Pollution from Ships, 1973, do not apply to the following new and existing ships subject to the supervision of the Register:

1 ships of less than 200 gross tonnage certified to carry less than 10 persons;

2 ships which do not have measured gross tonnage and are certified to carry less than 10 persons.

2.6.4 Documents.

2.6.4.1 Documents confirming the compliance with the requirements of the International Convention for the Safety of Life at Sea, 1974, the Protocol of 1978 relating thereto and Amendments 1981, 1983, 1988, 1989 and 1990, International Regulations for Preventing Collisions at Sea, 1972, and Radio Regulations, 1985, are as follows:

1 Passenger Ship Safety Certificate which is issued to passenger ships provided the requirements of the Rules for the Classification and Construction of Sea-Going Ships and the requirements of the Rules for the Equipment of Sea-Going Ships are complied with. Simultaneously with this Certificate the Record of Equipment for Passenger Ship Safety Certificate is issued. The duration of this Record is not limited;

2 Cargo Ship Safety Construction Certificate is issued to cargo ships only in case a Classification Certificate is available on board the ship and is valid while the Classification Certificate is in force;

3 Cargo Ship Safety Equipment Certificate is issued to cargo ships provided the requirements of the Rules for the Classification and Construction of Sea-Going Ships, Part VI "Fire Protection" and the requirements of the Rules for the Equipment of Sea-Going Ships, Part II "Life-Saving Appliances", Part III "Signal Means" and Part V "Navigational Equipment" are complied with. Simultaneously with this Certificate the Record of Equipment for Cargo Ship Safety Equipment Certificate is issued;

4 Certificate of Compliance of Construction and Equipment of the Ship with the Requirements of Regulation 54 of Chapter II-2 of 1981 Amendments to the International Convention for the Safety of Life at Sea, 1974;

5 Cargo Ship Safety Radio Certificate is issued to cargo ships provided the requirements of the Rules for the Equipment of Sea-Going Ships, Part IV "Radio Equipment" are complied with. Simultaneously with this Certificate the Record of Equipment for Cargo Ship Safety Radio Certificate is issued;

6 Nuclear Cargo Ship Safety Certificate is issued provided the requirements of the Rules for the Classification and Construction of Nuclear Ships;

7 Exemption Certificate is drawn up if a ship is allowed exemptions under, and in conformity with, the provisions of the International Convention for the Safety of Life at Sea, 1974, the Protocol of 1978.
relating thereto and Amendments 1981, 1983, 1988, 1989 and 1990 in addition to the Certificates mentioned in 2.6.4.1.1 — 2.6.4.1.5. The duration of the Exemption Certificate shall not be more than that of the Certificate to which it is attached.

2.6.4.2 Documents confirming the compliance with the requirements of the International Convention on Load Lines, 1966, are as follows:

1. International Load Line Certificate is issued for a period not in excess of 60 months provided the requirements of the Load Line Rules for Sea-Going Ships are complied with;

Notes: 1. The duration of the Certificate drawn up to a ship which embodies features of novel kind shall not be in excess of 60 months from the date of issue.

2. The duration of the Certificate drawn up to a ship which is not normally engaged on international voyages is limited to the single voyage for which it is issued.

2.6.4.3 Documents which confirm the compliance with the requirements of the International Convention on Tonnage Measurement of Ships, 1969, and the International Convention on Tonnage Measurement of Ships of Inland Navigation, 1966, are:

1. International Tonnage Certificate, 1969 is issued to the ships of 24 m in length and over engaged on international voyages;

2. Tonnage Certificate for the ship of inland navigation is issued to the ships measured in accordance with Rules for the Tonnage Measurement of Ships of Inland Navigation.

2.6.4.4 Documents confirming the compliance with the requirements of the International Convention for the Prevention of Pollution from Ships, 1973, and the Protocol of 1978 relating thereto are as follows:

1. International Oil Pollution Prevention Certificate together with Supplement Form A or Form B is issued to tankers of 150 gross tonnage and over and to any other ships of 400 gross tonnage and over provided the requirements of Part II of the Rules for the Prevention of Pollution from Ships are complied with;

2. International Pollution Prevention Certificate for the Carriage of Noxious Liquid Substances in Bulk (1973) is issued to all ships carrying noxious liquid substances in bulk provided the requirements of Part III of the Rules for the Prevention of Pollution from Ships are complied with;

3. International Sewage Pollution Prevention Certificate (1973) is issued to the ships not covered by 2.6.3.3 provided the requirements of Part IV of the Rules for the Prevention of Pollution from Ships are complied with;

4. Garbage Pollution Prevention Certificate is issued to all ships provided the requirements of Part V of the Rules for the Prevention of Pollution from Ships are complied with.

2.6.4.5 Document confirming the compliance with the requirements of Inter-Governmental Agreements on Load Lines is the Regional Load Line Certificate.

2.6.4.6 Documents confirming the compliance with the requirements of the IMO Codes: for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk; for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk; of Safety for Dynamically Supported Craft; of Safety for High-Speed Craft; for the Construction and Equipment of Offshore Drilling Units, of Safety for Special Purpose Ships; of Safe Practice for Solid Bulk Cargoes and of Safe Carriage of Grain in Bulk are, respectively:

1. International Certificate of Fitness for the Carriage of Dangerous Chemicals in Bulk is issued to the ships provided the requirements of the Rules for the Classification and Construction of Chemical Tankers, are complied with;

2. International Certificate of Fitness for the Carriage of Liquefied Gases in Bulk is issued to the ships provided the requirements of the Rules for the Classification and Construction of Gas Carriers are complied with;

3. Dynamically Supported Craft Construction and Equipment Certificate is issued to the ships provided the requirements of the Rules for Safety of Dynamically Supported Craft are complied with;

4. High-Speed Craft Safety Certificate is issued to a ship provided requirements of the Rules for the Classification and Construction of High-Speed Craft are met;

5. Mobile Offshore Drilling Unit Safety Certificate is issued to the ships provided the requirements of the Rules for the Classification and Construction of Mobile Offshore Drilling Units and the Rules for the Convention Equipment of Mobile Offshore Drilling Units are complied with;

6. Special Purpose Ship Safety Certificate is issued to the ships provided the requirements of the Rules for the Classification and Construction of Sea-Going Ships and the Rules for the Convention Equipment of Sea-Going Ships referring to the special purpose ships are complied with;

7. Certificate of Fitness of the Ship for the Carriage of Bulk Cargoes. Attached to the Certificate are a List of Bulk Cargoes and Supplement to the Certificate of Fitness of the Ship for the Carriage of Bulk Cargoes;

2.6.4.7 Documents confirming the compliance with the requirements of International Convention on Occupation Safety and Health (Dock Work), 1979 (ILO-152) are as follows:

1. Register Book of Ship’s Cargo Handling Appliances;
2. Certificate of Test and Thorough Examination of Cargo Handling Appliances;
3. Certificate of Test and Thorough Examination of Derrick Used in Union Purchase;
4. Certificate of Test and Thorough Examination of Interchangeable and Removable Components;
5. Certificate of Test and Thorough Examination of Steel Rope.

The conditions of issuing the Register Book and Certificates are stated in 1.4.7.

2.6.4.8 Document, confirming the compliance with the requirements of the Shipping Regulations for the Danube, 1975, is a certificate of registry which is issued to the ships engaged on the international voyages down the Danube provided the requirements of the Rules for the Classification and Construction of Ships of Inland Navigation (for the Danube) are complied with.

2.6.4.9 Documents confirming compliance with the International Convention for Safe Containers, 1972 are as follows:

Certificate of General Cargo Container Safety Approval by Design Type,
Certificate of Thermal Container Safety Approval by Design Type,
Certificate of Tank Container Safety Approval by Design Type.

Documents confirming compliance with the Customs Convention for Containers, 1972 are as follows:

Certificate of Container Approval at a Stage Subsequent to Manufacture,
Certificate of Container Approval by Design Type.

2.6.4.10 Documents issued by the Register under the international conventions and agreements shall be kept on board the ship; but the certificates or certified copies thereof shall be posted up in a prominent and accessible place in the ship if required by the relevant conventions and agreements.

2.6.5 Surveys.

1. initial survey to issue the relevant certificates;
2. periodical surveys to renew the relevant certificates;
3. intermediate surveys to confirm the validity of the relevant certificates;
4. annual surveys to confirm the validity of the relevant certificates;
5. additional surveys, if necessary.

2.6.5.2 According to the requirements of the International Convention on Load Lines, 1966, the ships are submitted for the following surveys:

1. initial survey to issue a certificate;
2. periodical surveys to renew a certificate;
3. periodical inspections to confirm the validity of a certificate;
4. additional surveys, if necessary.

2.6.5.3 For the initial survey, ships are submitted which are built or converted to the Register Rules and under the Register supervision, as well as ships not built to the Register Rules or without the supervision of the Register or another body authorized by the Register to act on its behalf.

The initial survey means thorough and complete survey and, if required, testing of the hull, machinery, equipment and outfit of a ship in order to ascertain that they comply fully with the requirements of the international conventions and agreements as well as to determine the possibility of issuing the relevant certificates.

2.6.5.4 In order to ascertain the extent of the initial survey one should be guided by the following:

1. if a ship is granted convention documents issued by competent bodies, a Classification Certificate of a foreign classification body and the appropriate technical documentation, the initial survey is carried out to the extent to which the ship should have been submitted for subsequent certification or renewal of class and periodical survey of the equipment of sea-going ships.

If there is no necessary technical documentation on board the ship, the extent of the survey may be enlarged for those parts of the ship for which there is no such documentation available;

2. if the convention documents are not available on board the ship but there is a Classification Certificate and necessary technical documentation, the initial survey shall be carried out to the extent of the special survey for class renewal and quinquennial survey of the equipment of sea-going ships in regard to those components (parts) of the ship for which the relevant certificates provided for by the conventions should be issued.
For issuing the Cargo Ship Safety Construction Certificate the initial survey may be omitted.

If there is no necessary technical documentation on board ship, the extent of the initial survey to be carried out may be enlarged at the discretion of the Register. If the convention documents and a Classification Certificate were not issued to the ship, the extent of the initial survey is specified by the Register in each case, but it may not be less than the extent of the special survey for class renewal and of quinquennial survey of the equipment of sea-going ships.

2.6.5.5 The periodical survey means thorough and complete survey and, if required, testing of the hull, machinery, equipment and outfit of a ship in order to ascertain that they are in a satisfactory condition and comply with the requirements of the international conventions and agreements for the intended service as well as in order to renew the relevant certificates. Periodical surveys are held at the regular stipulated intervals in the terms provided for by the international conventions and agreements.

2.6.5.6 The annual survey or periodical inspection (see 2.6.5.2.3) means general survey of a ship and her machinery and equipment that may comprise the inspections of the ship systems, machinery and equipment in operation to the extent required to confirm that the ship and her machinery and equipment continue to comply with the requirements of the international conventions and agreements for the intended service.

Annual surveys or periodical inspections are carried out within three months either way of each annual anniversary date of the certificate.

2.6.5.7 Intermediate surveys of a ship and her equipment are carried out between periodical surveys instead of the second or the third annual survey.

2.6.5.8 The scope of the periodical, intermediate and annual surveys of a ship is stated in Table 2.1.1 of Part II "Survey Procedure and Scope" of the Rules for the Classification Surveys of Ships, in Table 2.3 of Part I "Supervision Regulations" of the Rules for the Convention Equipment of Sea-Going Ships and in Table 2.6 of Part I "Supervision Regulations" of the Rules for the Prevention of Pollution from Ships.

The scope of the survey of the load lines is set forth in 1.4.3 of the Load Line Rules for Sea-Going Ships.

2.6.5.9 The additional (occasional) survey of a ship, her structure, machinery, equipment and outfit shall be carried out each time in case of an accident or defect affecting the safety of a ship or the condition or completeness of her life-saving appliances or another outfit, as well as in case of repair or replacement of the old equipment with new one for the purpose of ascertaining its conformity with the international conventions and agreements.

A survey of the ship after the accident shall be held in a port where the ship is at the moment or in the first port which the ship calls at after the accident. The survey is held in order to specify the damage, to agree upon the scope of work required to eliminate the consequences of the accident and to determine the possibility and conditions of retaining validity of the documents issued in conformity with the provisions of the international conventions and agreements.

2.6.5.10 An additional (occasional) survey may be held at the request of the shipowner or the underwriter between periodical and mandatory annual surveys or periodical inspections.

The survey is held in order to ascertain that the actual technical condition of the ship’s structure, machinery, equipment or outfit complies with the provisions of the international conventions and agreements.

2.6.5.11 An additional (occasional) survey may be held between periodical and annual survey or periodical inspections on the initiative of the Register.

2.6.5.12 The survey of the ship and all her items for the purpose of drawing up the convention documents and confirming their validity in cases of necessity shall be carried out simultaneously wherever possible.

The terms of surveys in principle shall coincide with the terms of the surveys for confirmation of class or for class renewal specified in Part I "Classification" of the Rules for the Classification and Construction of Sea-Going Ships.

2.6.5.13 Docking in appropriate scope is not taken into account when carrying out special survey of passenger ships engaged on international voyages.

2.6.6 Extension of validity of documents.

2.6.6.1 If at the time of expiration of validity of documents issued under the International Convention for the Safety of Life at Sea, 1974, and the Protocol of 1978 relating thereto and Amendments of 1981, 1983, 1988, 1989 and 1990, a ship flying the flag of the RF is not in the port of the RF, her safety certificates (except for Cargo Ship Safety Construction Certificate) may be extended by the Embassy or Consulate of the RF, by the Register or organizations or persons authorized by the Government of the RF for a period up to five months.

2.6.6.2 If at the time of expiration of validity of documents issued under the International Convention for the Safety of Life at Sea, 1974, and the Protocol of 1978 relating thereto and Amendments of 1981, 1983, 1988, 1989 and 1990 the ship flying the flag of the RF and is in the port of the RF, the safety certificates (except for Cargo Ship Safety Construction Certificate) may be extended by the Register for a period up to one month.
2.6.6.3 Safety certificates for a foreign ship may be issued or their validity may be extended by the Register only at the official request of the Government of the State (Embassy or Consulate) whose flag the ship is flying. In this case the extension of validity of safety certificates (except for Cargo Ship Safety Construction Certificate) for a foreign ship is carried out in the port:

of the RF or in any port, excepting the port of a State where the ship is registered, for a period up to five months;

in the port of the State where the ship is registered for a period up to one month.

2.6.6.4 Cargo Ship Safety Construction Certificate is extended for the same period and on the same conditions as those for a Classification Certificate, but the duration of the former is not to exceed five years.

2.6.6.5 The validity of the documents drawn up under the International Convention on Load Lines, 1966, and issued for a period of five years, may be extended for five months only after carrying out the surveys for drawing up and issuing to a ship a new International Load Line Certificate or International Load Line Exemption Certificate. The extension may be permitted if during carrying out the survey there is no possibility of issuing new International Load Line Certificate or International Load Line Exemption Certificate.

2.6.6.6 If at the time of expiration of validity of documents issued under the International Convention for the Prevention of Pollution from Ships, 1973, and the Protocol of 1978 relating thereto, a ship flying the flag of the RF is not in the port of the RF, the International Sewage Pollution Prevention Certificate (1973) may be extended by the Embassy or Consulate of the RF, by the Register or organizations or persons authorized by the Government of the RF for a period up to five months.

2.6.6.7 If at the time of expiration of validity of documents issued under the International Convention for the Prevention of Pollution from Ships, 1973, and the Protocol of 1978 relating thereto, a ship flying the flag of the RF is in the port of the RF, the International Sewage Pollution Prevention Certificate (1973) and the Garbage Pollution Prevention Certificate may be extended by the Register for a period up to one month.

The International Oil Pollution Prevention Certificate and the International Pollution Prevention Certificate for the Carriage of Noxious Liquid Substances in Bulk drawn up on the basis of the International Convention for the Prevention of Pollution from ships, 1973, and the Protocol of 1978 relating thereto are not to be extended after the expiry of validity.

2.6.7 Confirmation of documents.

3 TECHNICAL DOCUMENTATION

3.1 GENERAL PROVISIONS

3.1.1 Prior to the commencement of the work on the construction of ships or manufacture of materials and articles liable to supervision of the Register, the technical documentation within a scope determined in the relevant parts of the Rules shall be submitted to the Register for consideration and approval. If necessary, the Register may require that the documents be presented to it in a wider scope.

Standards and norms for individual materials and articles agreed with the Register may be submitted instead of a part of documents or of the documentation as a whole.

The scope of technical documentation for ships, containers or articles of special design and purpose submitted for consideration and approval to the Register is established in each case upon agreement with the Register.

3.1.2 Technical documentation may be submitted to the Register in one of the following variants:

1. technical documentation in the scope of a technical design with subsequent submission of working plans to the Register for approval;

2. technical documentation without subsequent submission of the working plans to the Register for approval. In this case, the scope of documentation submitted shall be such that all necessary data are available therein to ascertain the compliance of the designed ship, container or article with the Rules, as well as to provide the control in the process of manufacture of main structural assemblies of a ship, container or article.

The scope of technical documentation for each of the above-mentioned variants is given in the relevant parts of the Rules.

3.1.3 Amendments to the technical documentation approved by the Register relating to parts and
structures provided for by the requirements of the Rules shall be submitted to the Register for approval before they are made.

3.1.4 The technical documentation submitted to the Register for consideration and approval shall be so worked out or supplied with such additional information that it would provide ground to be sure that the provisions of the Rules are complied with.

3.1.5 Calculations necessary for determination of the parameters and values regulated by the Register Rules are to be performed according to the provisions of these Rules or the procedures agreed with the Register.

The procedures and methods applied for calculations shall provide an adequate degree of accuracy of solving the problem.

Calculations performed by means of computers shall be made according to the programs having the Register Type Approval Certificate. The Register may require to perform the check calculations according to any program.

The Register does not check the correctness of computational operations in making calculations including those according to the programs, having the Register Type Approval Certificate.

General provisions concerning the approval of the computer programs and agreement of the procedures of calculations are specified in 12.2 of Part II "Technical Documentation" of the Guidelines on Technical Supervision during Construction of Ships and Manufacture of Materials and Equipment.

3.1.6 Approval of the technical documentation is confirmed by putting the appropriate stamps of the Register on it.

Approval of the documentation by the Register does not cover those parts or structures shown in it to which the requirements of the Rules are not applicable.

3.2 DURATION OF VALIDITY OF APPROVED TECHNICAL DOCUMENTATION

3.2.1 The Register approval of the technical documentation is valid for the period of 6 years. By the expiry of this term or in case when the interval between the date of the documentation approval and the commencement of ship construction exceeds 3 years, the documentation shall be checked and corrected to take account of the amendments to the Register Rules introduced during this period, and submitted to the Register for consideration.

The approval ceases to be valid if the above requirements is not complied with.

3.2.2 During construction of series ships, in well-founded cases, the validity of the technical documentation approval specified according to 3.2.1 may be extended by the Register for the period not exceeding that required for completion of construction of two next ships of the series.

3.2.3 Approval of standards and regulating documents on containers, materials and articles is performed for the period of their validity.

When revising the standards and regulating documents they shall be checked to take account of the existing Rules and norms of the Register.

3.2.4 Notwithstanding the terms of approval, the technical documentation on ships, containers, materials and articles, as well as the approved standards, and regulating documents, shall be subjected to compulsory correction to take into account the adopted provisions of the international conventions and agreements to which the country whose flag a ship will be flying is a party.

3.2.5 All the documentation approved by and agreed with the Register shall be corrected to comply with the instructions circulated by the Register which provide for their unconditional fulfilment.
RULES FOR THE CLASSIFICATION AND CONSTRUCTION
OF SEA-GOING SHIPS

PART I. CLASSIFICATION

1 GENERAL

1.1 EXPLANATIONS

1.1.1 For the purpose of the present Rules for the Classification and Construction of Sea-Going Ships, classification means development, publication and application of the Rules continuous compliance with which will, along with the proper maintenance of the ship by the owner or operator, ensure:

.1 structural strength and integrity of the hull and its elements including structural fire protection,

.2 seaworthiness (stability) of the ship under all specified loading conditions and under particular sea-and-wind conditions,

.3 safe and reliable operation of its propulsion plant, systems and devices for ship control, other systems, auxiliary machinery and equipment including fire fighting equipment and thereby permit safe operation of the ship in accordance with its purpose.

1.1.2 A list of Rules for the Classification and Construction of Sea-Going Ships is to be found under 1.3.1.1.2 of General Regulations for the Supervision.

1.1.3 Definitions and explanations pertinent to the general terminology of the Rules are included in General Regulations for the Supervision.

1.2 APPLICATION

1.2.1 Rules for the Classification and Construction of Sea-Going Ships apply to:

.1 passenger ships, tankers, ships intended for the carriage of dangerous goods as well as tugs, irrespective of the power of main engines and gross tonnage;

.2 self-propelled ships not specified in 1.2.1.1, with the main engines of power output of 55 kW and upwards;

.3 ships not specified in 1.2.1.1 or 1.2.1.2 of 80 gross tonnage and upwards or ships fitted out with machinery and equipment of total prime movers power output of 100 kW and upwards;

.4 materials and equipment that are to be manufactured under the Register supervision (lists of relevant materials and equipment are given in the appropriate Parts of the Rules).

1.2.2 With the Register consent, the Rules may be applied for the classification of ships not specified in 1.2.1.

1.2.3 For special purpose ships of less than 500 gross tonnage, the applicable scope of the present Rules requirements is determined by the Register on the case-to-case basis.

1.2.4 The Rules set down the requirements regulating the assignment of class to a ship or a shipboard refrigerating plant.

1.2.5 Confirmation of compliance with the requirements of the Register Rules is the Register’s prerogative and is carried out in accordance with the procedure established by it.

Any statements to the effect a supervised item complies with the Rules requirements, which are made or documentally supported by a body other than the Register and which are not confirmed by the latter in accordance with the established procedure, cannot be considered as evidence of such a compliance.

2 CLASS OF A SHIP

2.1 GENERAL PROVISIONS

2.1.1 Assignment of the Register class to a ship means confirmation by the Register that the ship construction complies with the applicable requirements of the Register Rules and its technical condition complies with the conditions of the ship operation; the ship is taken under the Register supervision for a specified period with performing the surveys stipulated by the Rules for this period.

2.1.2 The Register may assign a class to a ship proceeding from the results of construction supervision, as well as assign or renew a class to a ship in service.

2.1.3 Renewal of a ship’s class means confirmation by the Register that the construction and technical condition of the ship comply with the provisions based on which a class has been assigned as well as extension of the Register supervision for a definite period as required by the Rules.
2.1.4 Class of a ship is, generally assigned or renewed by the Register for 5 years, however, in sound cases the Register may assign or renew a class for another period.

2.1.5 If a ship has the valid Register class this means that the ship is under the Register supervision specified by the Rules in respect to its technical condition and in full measure or to a degree considered adequate to the Register complies with the requirements of the Rules which apply to it according to its purpose, service conditions and class notation. If a class of a ship is valid it is certified by the valid Classification Certificate on board.

2.1.6 Classification Certificate shall cease to be valid, and the class shall be liable to be suspended by the Register in the following cases:

if the ship as a whole or her separate elements have not been subjected to scheduled periodical or occasional surveys in specified terms;

after an accident (the ship shall be submitted for occasional survey at port where the accident took place or at the first port of call if the accident took place at sea);

if alterations not agreed with the Register have taken place in the construction and/or if any change has been made in the equipment which may result in reducing the standards required by the Rules;

when repair of supervised items of a ship has been performed without the agreement and/or supervision of the Register;

when a ship navigates with a draught exceeding that specified by the Register for specific conditions as well as in case of operation of a ship in conditions which do not comply with the requirements for assigned class of a ship or the restrictions specified by the Register;

if the prescribed specific requirements which during previous survey of the ship were the conditions for assignment or confirmation of the Register class have not been fulfilled within the specified period;

if the process of surveying the ship by the Register has been suspended on shipowner’s initiative or through his fault;

when the ship has been taken out of service for a long period (more than 3 months) for fulfilment of the Register requirements (except the case when a ship is under repair for these purposes).

The Register shall specially notify the shipowner of suspension of a ship’s class and Classification Certificate.

2.1.7 Suspended (as stated in 2.1.6) class of a ship may be reinstated on the basis of satisfactory results of the appropriate periodical or occasional survey carried out by the Register in the case of ship to be submitted for survey. In so doing when the ship is taken out of service for a long period (more than 3 months), the scope of survey for reinstatement of a ship’s class shall be specially established by the Register taking into account the age and condition of the ship as well as the period for which she is taken out of service.

During the period from suspension of a class to its reinstatement or renewal the ship is considered to have been lost the Register class.

The class may be suspended for a period of no more than six months.

2.1.8 The class of a ship is withdrawn by the Register in the following cases:

.1 upon expiration of the maximum term of class suspension;

.2 when the Register and/or shipowner consider reinstatement of the class suspended as stated in 2.1.6 to be impossible;

.3 upon transfer of the ship to the class of another Classification Body;

.4 at the request of shipowner.

Withdrawal of the Register class means cessation of the Register supervision and cessation of the validity of the Classification Certificate.

2.1.9 The class of a ship shall be cancelled due to her loss or scrapping.

2.1.10 After assigning the class the Register introduces the sea-going self-propelled ships and self-propelled mobile offshore drilling units of 100 gross tonnage and upwards into the Register of Ships and excludes them in case of withdrawal or cancellation of a class. When the validity of a class is suspended, appropriate entry should be made in the Register Book indicating that the validity of a class is suspended up to the stated date.

2.2 CLASS NOTATION OF A SHIP

The class notation assigned by the Register to a ship or floating facility consists of the character of classification and additional distinguishing marks and descriptive notations defining structure and purpose of a ship or floating facility.

2.2.1 The character of classification assigned by the Register to a ship or floating facility consists of distinguishing marks:

**KM**, **KM**, (KM) — for self-propelled ships and floating facilities;

**KE**, **KE**, (KE) — for non-self-propelled ships and floating facilities with total power output of prime movers 100 kW and upwards which are liable to supervision by the Register in accordance with the Rules;

**K**, **K**, (K) — for other non-self-propelled ships and floating facilities.
2.2.2 Depending on the Classification body under whose supervision and according to whose Rules a ship or floating facility has been built, the character of classification is established as follows:

1 ships and floating facilities built according to the Rules and under supervision of the Register are assigned a class notation with the character of classification: KM or KE or K (see 2.2.1);

2 ships and floating facilities which were as a whole (or their hull or machinery installation, machinery and equipment) built and/or manufactured according to the Rules and under supervision of other classification body recognized by the Register, when classed with the Register are assigned a class notation with the character of classification: KM or KE or K (see 2.2.1);

3 ships and floating facilities which were as a whole (or their hull or machinery installation, machinery and equipment) built and/or manufactured without the supervision of a classification body recognized by the Register or without any survey of a classification body at all, when classed with the Register, are assigned a class notation with the character of classification: (KM) or (KE) or (K) (see 2.2.1);

4 ships and floating structures for which their design does not permit the main class notation out of those listed in 2.2.2.2 to be assigned a class with the character of classification: KM or KE or K.

This also applies when a ship or floating structure changes a class to the Register from one of the IACS Member Societies. The possibility of such a change is considered in each case by the Register Head Office.

2.2.3 Ice category marks

2.2.3.1 Ice category marks are assigned to icebreakers and ice ships.

1 Icebreakers - are specialized ships intended for all kinds of icebreaking operations: escort of ships in ice, surmount of ice ridges, breaking of a navigable channel, towing, breaking of ice and rescue operations. There are two main regimes of ice navigation while performing icebreaking operations: continuous motion and ramming.

2 Ice class ships - are ships intended for independent ice navigation (with possible surmount of ice ridges) or navigation in ice with icebreaker escort.

3 The following definitions are used for the description of ice navigation conditions:

Ice concentration is a measure of ice continuity, which is characterized by the ratio of the area covered by ice to the total water area using 10 number scale.

Open drift ice is an ice of concentration 4-6, where the floes do not touch each other.

Closepack ice is an ice of concentration 7-8 where ice floes touch each other forming ice ridge.

Compact ice (ice field) is an ice of concentration 9-10.

2.2.3.2 If an icebreaker complies with the requirements of the Rules, one of the following ice category marks is added to the class notation: L16; L17; L18; L19.

Icebreakers of the above categories have the following tentative service characteristics:

L16 - intended for ice breaking operations in harbour and roadstead water areas as well as in non-arctic freezing seas where the ice is up to 1.5 m thick. Continuous motion capability in compact ice field up to 1 m thick.

L17 - intended for ice breaking operations in the arctic seas on coastal routes during winter/spring navigation in ice up to 2.0 m thick and summer/autumn navigation in ice up to 2.5 m thick; in non-arctic freezing seas and mouths of rivers flowing into arctic seas in ice up to 2.0 m thick. Continuous motion capability in compact ice fields up to 1.5 m thick. The total shaft power not less than 11 MW.

L18 - intended for ice breaking operations in the arctic seas on coastal routes during winter/spring navigation in ice up to 3.0 m thick and summer/autumn navigation without restrictions. Continuous motion capability in compact ice field up to 2.0 m thick. The total shaft power not less than 22 MW.

L19: ice breaking operations on coastal routes in arctic seas during winter/spring navigation in ice up to 4.0 m thick and summer/autumn navigation without restrictions. Continuous motion capability in compact ice fields less than 2.5 m thick. The total shaft power not less than 48 MW.

2.2.3.3 Categories of ice class ships.

1 If a self-propelled ship complies with the respective requirements of the Rules, one of the following ice category marks is to be added to its class notation: L1, L2, L3, L4, L5, L6, L7, L8, L9. Ice category marks need not be added to the class notation of non-self-propelled ships.

2 Categories L1, L2, L3 which form the group of non-arctic categories refer to ships intended for navigation in freezing non-arctic seas (non-arctic ships).

3 Categories L4, L5, L6, L7, L8, L9 which form the group of arctic categories refer to ships intended for navigation in arctic seas (arctic ships).

4 For tugs, depending on the compliance with the appropriate ice category requirements, one of the following marks is added to the class notation: L2, L3, L4, L5.

2.2.3.4 Averaged quantitative data about permitted service areas and ice service conditions presented in Tables 2.2.3.4-1 - 2.2.3.4-3 are to be used when choosing the ice category of arctic ships.

*) A speed of 5 knots is to be assumed which is typical for independent navigation
**) A speed of 3 knots is to be assumed which is the minimal channel speed

Extreme ice conditions during independent ice navigation for ice class ships at speeds characteristic of this category (or group of categories) are stipulated in the Table 2.2.3.4-3.

2.2.3.5 When choosing the category of ice strengthening for non-arctic ships, it is recommended to use mean values of permitted conditions of ice navigation set forth in Table 2.2.3.5.

2.2.3.6 Arctic ships may navigate in non-arctic freezing seas in ice conditions corresponding to those stated in 2.2.3.4-2 and 2.2.3.4-3.

2.2.3.7 In Table 2.2.3.7 an attempt has been made to correspond the ice category marks of the present Rules to those of the Rules, edition 1995.

2.2.4 Subdivision distinguishing marks.

Ships complying with the applicable requirements of Part V "Subdivision" and fully complying with the requirements of Section 3 of the above Part in the case of flooding of any one compartment or any two or three adjacent compartments over complete length of the ship in the case of design side damage specified in 3.2 are assigned subdivision distinguishing mark «I», «II» or «III» added to the character of classification, respectively.

2.2.5 Distinguishing marks for restricted areas of navigation.

2.2.5.1 Ships complying with the Rules requirements provided for ships operating only in restricted areas of navigation are assigned one of the following
marks: I, II, II CII, III CII or III added to the character of classification to clarify restrictions of the
ship navigation as follows:

.1 I — navigation in sea areas at seas with a wave
height with 3 per cent probability of exceeding 8,5 m
and with the ships proceeding not more than
200 miles away from the place of refuge and with
an allowable distance between the places of refuge
not more than 400 miles;

.2 II — navigation in sea areas at seas with a
wave height with 3 per cent probability of exceeding 7,0 m with ships proceeding from the place
of refuge not more than 100 miles and with an
allowable distance between the places of refuge not
more than 200 miles; in this case, restrictions for
floating cranes are determined by the Register in each
particular case;

.3 II CII — river-sea navigation at seas with
a wave height with 3 per cent probability of
exceeding 6,0 m with ships proceeding from the place
of refuge:
- in open seas up to 50 miles and with an
allowable distance between the places of refuge not
more than 100 miles,
- in enclosed seas up to 100 miles and with an
allowable distance between the places of refuge not
more than 200 miles;

.4 III CII — river-sea navigation at seas with
a wave height with 3 per cent probability of
exceeding 3,5 m with due regard for particular
restrictions on the area and conditions of navigation
resulting from the wind and wave conditions of the
basins with determination of a maximum allowable
distance from the place of refuge which in no case
should be more than 50 miles;

.5 III — harbour, roadstead and coastal navigation
within limits established by the Register in each case.

2.2.5.2 The restrictions provided for by 2.2.5.1
define the allowable conditions of ship’s navigation
resulting from ship’s stability and strength which are
indicated in the Seaworthiness Certificate and in the
Classification Certificate.

2.2.5.3 Particular restrictions on the area and
conditions of navigation for ships of river-sea
navigation III CII are determined as the geographical
place-names of basins or their parts with the
indication, where necessary, of the geographical
boundary of the navigation area within the basin,
the restrictions on proceeding from the place of
refuge and the restrictions of ship navigation by
calendar periods, or an indication of voyage between
the terminal ports. In this case, the restrictions with
due regard to the wind and wave conditions of the
basins are to be determined by using the data of
Table 2.2.5.3 or the data from the submitted to the
Register justifications of possibility of ship’s naviga-
tion in the certain area or passage, made in
accordance with the procedure approved by the
Register.

2.2.5.4 Whatever the area of navigation of ships
whose stability does not comply with the require-
ments of Part IV "Stability" of the Rules imposed
upon the ships navigating in winter seasonal zones to
the North of parallel 66 30’ N and to the South of
parallel 66’00’ S as well as in winter in the Bering Sea,
the Sea of Okhotsk and in the Tatar Strait, the
Register specifies the appropriate restrictions by
introducing the entry into the Classification Certifi-
cate that the ship is not allowed to navigate in the
above winter seasonal zones and areas.

2.2.6 Distinguishing automation marks.

Ships and floating facilities complying with the
requirements of Part XV "Automation" of the Rules
are assigned one of the following distinguishing marks: A1, A2 or A3 added to the character of
classification depending on the automation extent of
the installation, namely:

2.2.6.1 A1 — automation extent of the machinery
installation of self-propelled ships and floating
facilities sufficient for its operation with unattended
machinery spaces and main control station as well.
Passenger ships and special purpose ships carrying on
board more than 200 persons of special personnel are
not assigned the distinguishing mark A1;

2.2.6.2 A2 — automation extent of the machinery
installation of self-propelled and non-self-propelled
ships and floating facilities sufficient for its operation
by one operator in the main control station with
unattended machinery spaces;

2.2.6.3 A3 (applicable only to ships and floating
facilities with the main machinery power output up to
2250 kW) — automation extent of the machinery
installation of self-propelled and non-self-propelled
ships and floating facilities sufficient for its operation
with unattended machinery spaces.

2.2.7 Distinguishing mark of one man bridge
operated ship.

If the navigational equipment of self-propelled ship
installed on the navigating bridge complies with the
requirements for self-propelled one man bridge
operated ships specified in Part V "Navigational
Equipment" of Rules for the Equipment of Sea-
Going Ships, a distinguishing mark OBHM (OMBO
- in English) is added to the character of classifica-
tion.

2.2.8 Distinguishing mark for ships carrying
equipment for fire fighting aboard other ships.

If a ship carries supplementary systems, equip-
ment and outfit for fire fighting aboard other ships,
offshore drilling units, floating and shore structures
and if the ship is in full compliance with the relevant
requirements of the Rules in respect to those

</tbody>
</table>

appliances, marks ΠI1V, ΠI, ΠI2V, ΠI2 or ΠI3V are added to the main class notation proceeding from the degree of the ship equipment with these appliances. The degree of the ship equipment for fire fighting in other structures is determined on the basis of the list of fire fighting equipment and systems prescribed by Chapter 2.13, Part VI "Fire Protection".

2.2.9 Descriptive notation in the character of classification.

Ships complying with a definite scope of requirements of the Rules taking account of their structural particulars and service conditions are assigned the appropriate descriptive notation added to the character of classification of a ship.
The current Register Rules cover certain requirements the fulfilment of which makes possible introducing of the following descriptive notations in the character of classification: NTMS¹, tug, drilling ship, gas carrier², hopper, dredger, catamaran, container ship, crane vessel, timber carrier, bulk carrier, ro-ro ship, tanker³, docklift ship, oil tanker, oil recovery ship, passenger ship, passenger ro-ro ship, MODU⁴, floating dock, floating crane pontoon (transporting pontoon), ore carrier, fishing vessel, salvage ship, special purpose ship, supply vessel, shipborne barge, chemical tanker⁵, berth-connected ship.

A ship purpose of those listed in the definition of the berth-connected ship under 1.1 of the General Regulations for the Supervision is to be given in brackets, where the descriptive notation "berth-connected ship" is added to the class notation.

Special symbols and descriptive notations of the class notations of high-speed craft shall be stated in conformity with Ch. 2 "Class of a ship" of Part I "Classification" of the Rules for the Classification and Construction of High-Speed Craft (1998) published by the Register.

If the scope of the Rules requirements which a ship complies with allows, two of the above-mentioned descriptive notations may be stated in the class notation of a ship (e.g. passenger hydrofoil craft) or the descriptive notation may be written as compounds (oil/bulk carrier, oil/bulk/ore carrier).

If an oil tanker complies with the requirements for the ships carrying petroleum products having a flash point above 60°C this temperature is sure to be indicated in the descriptive notation. For example: oil tanker (> 60°C), oil/ore carrier (> 60°C).

When adding descriptive notation to the character of classification such as chemical carrier: oil tanker, bulk carrier, ore carrier or the word combinations: oil/bulk carrier, oil/ore carrier etc. after descriptive notation it is sure to be added (OPTI) in Russian text and (ESP) in English text. This means the necessity to survey these ships based on the Enhanced Survey Programme.

For example: oil/ore carrier (> 60°C) (ESP).

2.2.10 Limitations on validity of some distinguishing marks.

When the particular scope of requirements of the Rules on the basis of which the appropriate distinguishing marks are introduced in the class notation are met only under limitations specified by the Register, these distinguishing marks and limitations, on exceeding of which these marks become invalid, are added (in parentheses) to the class notation, e.g.:

**KM МУ.АМ А2 ro-ro (МУ.АМ А2 at d ≤ 8.4 m).**

2.2.11 Distinguishing mark for a nuclear ship.

If a ship is fitted out with a nuclear propulsion plant and complies with the requirements of these Rules as well as the Rules for the Classification and Construction of the Nuclear Ships, a distinguishing mark ☼ is added to the character of classification.

2.2.12 Distinguishing mark for a ship intended for carriage of refrigerated cargo.

Transport ships intended for carriage of refrigerated cargo in specially equipped spaces and/or in thermal containers are assigned the distinguishing mark РЕФ added to the character of classification.

Along with that such ships shall have a refrigerating plant classed in compliance with Section 5 of this Part of the Rules and intended specially to maintain the required temperature in the said spaces and/or containers, as well as meet the applicable requirements of Part XII "Refrigerating Plants."

2.3 ADDITIONAL CHARACTERISTICS

2.3.1 When complying with definite requirements of the Rules stipulated by the structural features or operational characteristics of the ship the fulfilment of which is not reflected by distinguishing marks and descriptive notation in the class notation, the confirmation of compliance of the ship with such requirements is certified by the entry in column "Other characteristics" of the Classification Certificate stating for example that a ship as a whole or her separate cargo spaces are equipped for the carriage of dangerous cargoes of a category..., the ship is equipped for the carriage of cargo in international standard containers on deck and/or in appropriate holds, that the ship is suitable for operation in waters covered with oil, etc.

2.4 ALTERATION OF MARKS IN CLASS NOTATION

2.4.1 The Register may delete or alter any mark in the class notation in the case of any alteration of, or non-compliance with the requirements defining the insertion of this mark in the class notation.

---

¹ See Rules for the Classification and Construction of Nuclear-Technological Maintenance Ships (NTMS), 1982.
² Full descriptive notations are specified, respectively, in the Rules for the Classification and Construction of Gas Carriers, the Rules for the Classification and Construction of Mobile Offshore Drilling Units, the Rules for the Classification and Construction of Ships Carrying Dangerous Chemicals Bulk.
³ The descriptive notation "tanker" may be accompanied by a ship type specification in brackets such as "(wine tanker)", "(water tanker)", etc.
3 TECHNICAL DOCUMENTATION OF A SHIP

3.1 TECHNICAL DESIGN DOCUMENTATION OF A SHIP UNDER CONSTRUCTION

3.1.1 General provisions.

Before the beginning of the construction of a ship technical design documentation proving that the requirements of the Rules of the Register applicable to the ship concerned are complied with is to be submitted to the Register for consideration. The documentation for consideration is to be submitted to the Register as a rule in three copies completed in accordance with the lists given in 3.1.2 - 3.1.11 taking into account the peculiarities and type of a ship.

3.1.2 General.

.1 general ship’s specification (no approval stamps are needed);
.2 general arrangement plans with indication of escape routes;
.3 list of associated equipment and materials with indication of the basic technical data, manufacturer and availability of the approval of the Register or other competent body (no approval stamps are needed);
.4 drawing of explosion-dangerous zones and spaces;
.5 list of regime measures carried out by the shipowner when preparing the oil recovery ship for performing operations on elimination of oil spillage.

3.1.3 Hull documentation.

3.1.3.1 In the case of subsequent approval of working documentation the following documentation is to be submitted:

.1 determination of scantlings of hull members (no approval stamps are needed);
.2 midship section plan with the most typical transverse sections with indication of spacing between main longitudinal and transverse members, main particulars of the ship and their ratios, class notation of a ship;
.3 constrictional profile with indication of frame spacings, boundaries of the portions of the ship’s length, position of the watertight bulkheads, pillars, arrangement of superstructures and deckhouses;
.4 deck and platform plans with indication of design loads (including the loads induced by lift trucks and containers), positions and dimensions of openings, their strengthening, end structures of the side coamings;
.5 double bottom (single bottom) plan together with sea chest section and with indication of pressure in the blowing system. For bulk carriers and ore carriers an allowable load on inner bottom plating is to be indicated;
.6 shell expansion with indication of the boundaries of the ship’s hull sections, positions and dimensions of openings in shell plating, and for ships strengthened for navigation in ice also the upper and lower edges of the ice belt and corresponding forward and aft draughts (with due regard for trim), arrangement of intermediate frames. Shell expansion for glass reinforced ships is to be submitted if the outer shell plating has different thickness;
.7 drawings of longitudinal and transverse bulkheads including tank wash bulkheads (for tanks the heights of overflow and air pipes shall be indicated);
.8 drawing of the after end framing and sternframe;
.9 drawing of the fore end framing and stem;
.10 drawings of propeller brackets and bossings, as well as fixed nozzles;
.11 drawings of seatings of main machinery and boiler bearers with bottom construction in that area with indication of the type and power of machinery as well as with indication that seatings and bearers comply with the requirements of the Supplier’s technical documentation on main machinery and boilers or that no special requirements are placed by the Supplier on the seatings and bearers;
.12 drawing of superstructures and deckhouses;
.13 basic parameters of the hull protection by damping from damages when mooring (for ships to be moored at sea to other ships);
.14 strength calculations for the case of loading and stowage of bulk cargoes other than grain.

3.1.3.2 With no subsequent approval of working documentation, documentation as stated in 3.1.3.1 is to be submitted with indication of tables of pressure heads, compartments, dimensions and position of manholes and other openings on the double bottom plan (see 3.1.3.1.5).

The following documentation is to be presented additionally:

.1 scheme of welding quality control and table of hull welding containing the following information:
.1.1 name and thickness of structural components to be joined;
.1.2 shape or symbol of edge preparation;
.1.3 marks and grades of base metal;
.1.4 marks and grades of welding consumables;
.1.5 method of welding and position of joint in space.

---

1 All drawings mentioned below are to indicate the scantlings of the hull members, their material (with indication of grades according to Part XIII "Materials"), as well as typical sections and details, types and dimensions of fillet welds.
If the information indicated in 3.1.3.2.1.1-3.1.3.2.1.5 is stated to the full in the drawings of the ship hull, then submission of the table of welding is not required;

.2 subdivision of hull into sections, including brief description of prefabricating and welding methods (no approval stamps are needed);

.3 description of the basic technological process of joining hull parts afloat based on the methods of carrying out such operations acceptable for the Register;

.4 detailed description of the technological hull constructing process, containing the information on materials, methods of forming the structural items, necessary conditions required during hull construction, as well as analysis of the structural strength both local and general (only for ships constructed of glass-reinforced plastic);

.5 scheme of tightness test of hull structures;

.6 drawings of penetrations of piping, ventilation ducts, cable ducts, etc. through bulkheads, decks, inner bottom, watertight floors and web members;

.7 programme of mooring tests and sea trials;

.8 Loading Manual for ships of 65 m and over in length (see 1.4.9, Part II "Hull").

3.1.4 Documentation on arrangements, equipment and outfit.

3.1.4.1 In the case of subsequent approval of working documentation, the following is to be submitted:

.1 arrangement plan of openings in hull, superstructures and deckhouses with indication of coaming heights and type of closing appliances;

.2 strength calculation of closing appliances (no approval stamps are needed);

.3 general arrangement plans of steering gear, active means of ship’s steering, anchor, mooring and towing arrangements;

.4 calculations of strength and efficiency of the rudder, calculations of means of ship’s active steering, anchor, mooring and towing arrangements, as well as diagram of active force for tugs (no approval stamps are needed);

.5 drawings of signal masts and rigging;

.6 calculation of signal masts and rigging (no approval stamps are needed);

.7 general arrangement plan of guide members for containers in holds;

.8 calculation of guide members for containers in holds (no approval stamps are needed);

.9 drawings of openings in subdivision bulkheads and their closing appliances.

3.1.4.2 With no subsequent approval of working drawings the documentation as stated in 3.1.4.1 is to be submitted, as well as:

.1 list of emergency outfit and its arrangement;

.2 programme of mooring tests and sea trials;

.3 documentation stated in 1.3.4 of Part III "Arrangements, Equipment and Outfit".

3.1.5 Documentation on stability (no approval stamps are needed):

.1 lines drawing, coordinate tables of lines drawing;

.2 hydrostatic curves;

.3 curves of areas and static moments of hull cross sections;

.4 calculations and curves of arms of form stability (cross-curves) with schemes of hull volumes taken into account;

.5 summary table of displacements, positions of centre of gravity, trim and initial stability for various loading conditions;

.6 calculation materials relating to verification of ship’s stability according to the Rules; mass tables for various loading conditions with indication of distribution of cargoes, oil fuel, fresh water and liquid ballast in tanks; calculations of roll amplitude and weather criterion; diagrams of windage area of a ship and calculations of heeling moments; calculations of heel caused by crowding of passengers and by turning; calculations of icing, angles of flooding, corrections for free surface effect of liquid cargoes and stores; arrangement plans of openings in hull, superstructures and deckhouses, etc.;

.7 summary table of the results of stability verification according to the Rules and curves of static or dynamic stability;

.8 capacity curves;

.9 stability calculations for the case of loading and stowage of bulk cargoes other than grain.

3.1.6 Documentation on subdivision.

.1 calculation on probability estimation of subdivision (if required) and curves of floodable length of compartments (no approval stamps are needed);

.2 calculations of damage stability and trim including static stability curves (no approval stamps are needed);

.3 plan of subdivision showing all watertight structures and openings with indication of types of closing appliances, as well as arrangements used for equalizing heel and trim of the damaged ship;

.4 cross-curves of stability (for damaged ship) if necessary for the adopted method of damage stability calculation (no approval stamps are needed);

.5 calculations of sectional areas of cross-flooding fittings and of uprighting time of ship (no approval stamps are needed);

.6 corner point coordinate table for compartments and tanks.

3.1.7 Documentation on fire protection.

3.1.7.1 In the case of subsequent approval of working drawings the following documentation is to be submitted:
.1 arrangement plan of fire-proof divisions (doors included) with indication of the protection method for cargo ships;

.2 elementary diagrams of fire extinguishing systems; arrangement of fire extinguishing stations, fire stations and control stations of ship’s fire extinguishing systems;

.3 diagrams of fire detection and alarm systems;

.4 calculations of fire extinguishing systems: water fire main system, froth fire extinguishing system, etc., (no approval stamps are needed);

.5 schemes or descriptions of insulation, lining, finishing and deck covering with indication of fire risk categories of the materials used, as well as calculation of the amount of combustible materials per 1 m² of the floor area of the standard spaces, calculation of calorific values of combustible materials used for veneer of non-combustible bulkheads, linings and ceilings, calculation of the maximum limited volume of combustible materials used for facings, mouldings, decorations and veneers (no approval stamps are needed);

.6 full information on fire hazard categories of new materials used (no approval stamps are needed);

.7 diagram of bunkering, storage and distribution system for oil fuel with a flash point below 43°C for ships and helicopters;

.8 list of fire fighting outfit;

.9 control diagram of air medium (for oil recovery ships).

3.1.7.2 With no subsequent approval of working drawings documentation as stated in 3.1.7.1 is to be submitted and additionally:

.1 arrangement plan of fire-proof divisions (doors included) with indication of numbers of their Type Approval Certificates or with Reports containing satisfactory results of the fire test required, drawing of items and elements of fire-proof divisions of types A and B;

.2 drawings of insulation, linings and deck coverings;

.3 arrangement plan of fire fighting outfit;

.4 list of spare parts and tools;

.5 programme of mooring and sea trials;

.6 fire plans according to 1.4, Part VI "Fire Protection".

3.1.8 Documentation on machinery and boiler installations.

3.1.8.1 In the case of subsequent approval of working drawings the following is to be submitted:

.1 general arrangement plans of machinery and equipment in the machinery spaces of category A (see 1.2, Part VII "Machinery Installations") with indication of escape routes also in emergency diesel generator spaces;

.2 diagram and description of the remote control for main machinery complete with information on equipment of remote control stations with control devices, indication and alarm signalling devices, means of communication and other arrangements;

.3 documentation on shafting:

.3.1 general view of shafting;

.3.2 drawings of stern tube and parts of stern tube arrangement;

.3.3 drawings of shafts (propeller, intermediate and thrust);

.3.4 drawings of shaft connections and couplings;

.3.5 drawings of journal and thrust bearings of shafting and their fastening to seatings;

.3.6 strength calculation of shafts and their fastening parts (no approval stamps are needed);

.3.7 load calculation for shafting bearings (no approval stamps are needed);

.3.8 calculation of fitting of propeller and shafting couplings (no approval stamps are needed);

.3.9 torsional vibration calculations in conformity with Section 4, Part VII "Machinery Installations" (no approval stamps are needed);

.3.10 stern tube bearing and stern tube seal lubrication and cooling diagrams;

.4 documentation on propeller:

.4.1 general view of propeller;

.4.2 drawings of blade, boss and items for their securing (for detachable blade propeller and controllable pitch propeller);

.4.3 diagrams of actuating mechanism of CP-propeller and its description;

.4.4 drawings of the main parts of the pitch control gear of CP-propeller, including hydrocylinders, push-pull rods, pistons, slides, lubricating oil supply tube to hydrocylinder in hub;

.4.5 strength calculation of propeller blade and for detachable blade propellers and CP-propellers — also calculation of fastening of blades to the boss (no approval stamps are needed);

.5 documentation on active means of the ship’s steering (AMSS):

.5.1 general arrangement plans with necessary sections and sealing details;

.5.2 drawings and calculations of propeller, shafts, couplings, pinions, gear wheels of steerable propellers, waterjets and thrusters (no approval stamps are needed on calculations);

.5.3 drawings of shafts, gearing, rotors, blades and blade turning mechanism of vertical-axis propellers as well as strength calculations of the driving shaft of rotor, blade, gearing (no approval stamps are needed on calculations);

.5.4 drawings of bearings and seals;

.5.5 drawings of propeller nozzles and tunnels;

.5.6 diagrams of cooling, lubricating, hydraulic turning systems for steerable propellers (blades of CP-propellers) as well as particulars of pipings of the above systems,
.5.7 calculations and diagrams of electric drives (for electrically driven AMSS),
.5.8 documentation on monitoring, control, and protection systems,
.5.9 torsional vibration calculations (for main AMSS and dynamic positioning systems) and service life calculation of rolling bearings.
Moreover, the Register may require presentation of rotational and pendular vibration calculations for steerable propellers if used as main AMSS,
.5.10 material specifications for principal components,
.5.11 prototype and pilot specimen test programme,
.5.12 description, service and maintenance manual;
.6 documentation on refrigerating plants (see 4.3).

3.1.8.2 With no subsequent approval of working drawings, documentation as stated in 3.1.8.1 is to be submitted, including information on treatment and geometry of working surfaces, heat treatment, tolerances on mating parts, hydraulic tests, non-destructive test and additionally:
.1 calculation of parameters of shifting alignment;
.2 drawings of seating and attachment fittings of main machinery, shafting bearings and boilers;
.3 list of spare parts;
.4 programme of mooring tests and sea trials.

3.1.9 Documentation on automation equipment.

3.1.9.1 In the case of subsequent approval of working drawings, the following is to be submitted:
.1 list of systems, devices and elements used in automation systems, their technical description with indication of the purpose, principle of operation, data on reliability and Register approval;
.2 circuit schemes and block diagrams of alarm and warning systems, including diagrams of power supply;
.3 list of controlled parameters with indication of types of devices, manufacturers, data on reliability and Register approval for devices;
.4 technical documentation on remote automated control for main engines and CP-propellers: circuit schemes and block diagrams, front panels of the remote automated control deck with indication of all devices, diagram of power supply to remote automated control, diagrams of protection, alarm and indication of parameters of main engines and CP-propellers;
.5 circuit schemes and block diagrams of automation systems for main engines (cooling, lubricating oil, fuel oil preparation systems, etc.);
.6 technical documentation on automation of auxiliary engines and electric generating plant: circuit schemes and block diagrams, front panels of control desks for electric generating plant with indication of all devices, diagram of power supply, protection, signalling and indication of parameters of auxiliary engines and electric generators;
.7 technical documentation on automation of boiler installation: circuit schemes and block diagrams, front panels of control desks with indication of all devices, diagrams of power supply, protection, signalling and indication of parameters;
.8 circuit schemes and block diagrams of automation of starting air compressors, including diagrams of protection, alarm and indication;
.9 circuit schemes and block diagrams of automation and remote control of bilge and ballast systems, diagrams of power supply, signalling and indication;
.10 circuit schemes and block diagrams of remote level sounding in tanks;
.11 drawings of front panels of desks and boards of control and alarm signalling systems at the main control station and on the bridge with indication of all devices;
.12 general arrangement plans of automation equipment at the main control station and on the bridge;
.13 list of spare parts for automation systems.

3.1.9.2 With no subsequent approval of working plans documentation as stated in 4.1.9.1 is to be submitted and additionally:
.1 circuit schemes and block diagrams of automation systems supervised by the Register and stated in the appropriate parts of the Rules which are not indicated in 4.1.9.1;
.2 programme of mooring tests and sea trials.

3.1.10 Documentation on pumping and piping.

3.1.10.1 In the case of subsequent approval of working plans the following documentation is to be submitted:
.1 documentation on ship’s systems:
.1.1 bilge system diagram;
.1.2 ballast system diagram;
.1.3 heeling and trimming system diagrams;
.1.4 air, overflow and sounding pipes diagrams;
.1.5 diagrams of ventilation and air conditioning systems of accommodation, service, cargo, machinery and working spaces with indication of watertight bulkheads and fire-proof divisions, arrangement of fire dampers, as well as indication of closures of ventilation ducts and openings;
.1.6 diagrams of sewage and other waste water systems, as well as scuppers with indication of watertight bulkheads, freeboard deck and distances from waterline or freeboard deck to appropriate openings, as stated in 4.3.2.4 and 4.3.2.6 of Part VIII "Systems and Piping";
.17 diagrams of blowing and heating systems of sea chests, heating system of side fittings, heating system for liquids in tanks, steaming system for tanks;  
.18 diagram of the compressed air system for tyfons, for blowing the sea chests;  
.19 diagrams of hydraulic systems for drives of mechanisms and arrangements;  
.10 diagrams of systems: cargo, stripping, vapour emission control and gas vent systems (for oil tankers and combination carriers);  
.11 calculations of the systems: bilge, ballast, vapour emission control; ventilation of accumulator rooms, cargo pump rooms, enclosed spaces and holds intended for the carriage of motor vehicles (no approval stamps are needed);  
.2 documentation on machinery installation systems:  
.2.1 diagrams of live and exhaust steam systems;  
.2.2 diagrams of blowing-off systems for boilers, machinery and steam piping;  
.2.3 diagram of condensate and feed water system;  
.2.4 diagram of oil fuel system;  
.2.5 diagram of lubricating oil system;  
.2.6 diagrams of fresh and sea water cooling systems;  
.2.7 diagram of starting air system;  
.2.8 diagram of exhaust gas pipes and uptakes;  
.2.9 drawing of sea chests and ice chests equipment;  
.2.10 calculation of starting air system;  
.2.11 calculation of fuel oil service tank capacity of emergency diesel-generator.  
3.10.2 With no subsequent approval of working plans the documentation as stated in 3.1.10.1 is to be submitted including the information on materials, insulation, manufacture, assembling, arrangement, hydraulic tests, etc. and additionally:  
.1 drawings of silencers and spark arresters of exhaust gas pipes and uptakes;  
.2 programme of mooring tests and sea trials.  
3.11.1 Documentation on electrical equipment.  
3.11.1.1 In the case of subsequent approval of working plans, the following is to be submitted:  
.1 circuit diagrams of power generation and distribution from the main and emergency sources of electrical power: ship’s mains, lighting (up to section switchboards) and navigation lights;  
.2 circuit diagrams and general arrangement plans of main and emergency switchboards, control desks and other switchboards of non-standard design;  
.3 calculation results of necessary output of ship’s electric power plant providing for the operating conditions specified in 3.1.4 of Part XI "Electrical Equipment", substantiation of the choice of the number and output of generators, as well as calculation of output of emergency sources of electrical power (no approval stamps are needed);  
.4 calculation results of cross-sections of cables with indication of their types, currents and protection (no approval stamps are needed);  
.5 circuit or detailed diagrams of the main current, excitation, control, pilot, signalling, protection and interlocking of the electric propulsion plant;  
.6 calculation results of necessary output of the propulsion generators to ensure normal operation under all operating conditions of ship’s service (no approval stamps are needed);  
.7 calculation results of short-circuit currents and analysis of selective properties of protection equipment for rated current generators or for generators working in parallel in excess of 1000 A;  
.8 calculation results of illumination intensity for spaces (no approval stamps are needed);  
.9 circuit diagrams of electric engine telegraph, telephone communication, general alarm system, fire detection and fire alarm systems, alarms to warn that fire smothering system is put into action, signalling systems of closing of watertight and fireproof doors, alarms in the engineers’ accommodation spaces;  
.10 circuit diagrams of essential electric drives according to 1.3.2.1.5 of Part XI "Electrical Equipment";  
.11 diagrams of lubrication systems for electric machines and air cooling systems for main electric machines;  
.12 diagrams of earthing of the protection system and, if necessary, calculations of lightning conductors for tankers, gas carriers, drilling units and non-metal ships;  
.13 circuit diagram of cable runs with indication of spaces which they pierce;  
.14 capacity calculation results for accumulator batteries of emergency lighting, navigation lights, general alarm system, fire alarm system and fire smothering appliances starting devices of the emergency diesel-generator set;  
.15 results of preliminary calculations of non-linear distortion factors in different parts of ship’s mains when using power semiconductor units;  
.16 information on electrical equipment installed in explosion dangerous zones, areas and spaces with indication of its version for each space;  
.17 calculation of expected efficiency of overload protection of generator sets by means of disconnection of the part of consumers with explanations of the number of disconnection steps and the list of disconnected consumers in every step;  
.18 diagram and drawing of disconnection and blocking system of electrical equipment which is not used in operations on elimination of oil spillage;  
.19 instruction on preparation and application of electrical equipment for elimination of oil spillage.
determining procedure of compulsory disconnection and blocking of electrical consumers without Certificates on Safe Type Electrical Equipment;

.20 drawings of equipment layout and cable laying in dangerous areas and spaces. Documentation (certificates issued by competent bodies), confirming the possibility of using the electrical equipment in dangerous areas and spaces;

.21 documentation on fixed and portable devices for measuring and signalling of explosive concentrations of gases;

.22 calculation of voltage dip when a consumer with maximum starting power is switched on;

.23 list of all essential electrical equipment installed on board the ship with indication of technical characteristics and data on approval of this equipment by the Register or another competent body.

3.1.11.2 With no subsequent approval of working plans, documentation as stated in 3.1.11.1 is to be submitted, as well as the following:

.1 drawings of cable runs and their penetrations through watertight bulkheads, decks and platforms with indication of measures taken to suppress radio interferences;

.2 diagrams of main and emergency lighting in the spaces and places of arrangement of essential appliances, evacuation routes, survival craft embarkation stations at the deck and outboard (supplying from section switchboards)

.3 list of spare parts;

.4 programme of mooring tests and sea trials;

.5 drawings of arrangement and installation of electrical equipment in all spaces and zones of the ship;

.6 assembly drawings (only for non-standard articles): main switchboards, emergency switchboards, electric propulsion plant boards, control stations and desks, special boards, power and lighting switchboards;

.7 elementary diagrams of outer connections and arrangement and installation drawings of devices for measuring non-electric values (level, pressure, temperature indicators, etc.).

3.1.11.3 Where refrigerating plants are to be classified, documentation as stated in 3.1.11.1 and 3.1.11.2 is to contain data concerning electrical equipment of refrigerating plant.

3.2 TECHNICAL DOCUMENTATION FOR A SHIP SUBJECT TO CONVERSION OR RECONSTRUCTION

3.2.1 Prior to commencement of work on conversion or reconstruction of a ship, technical documentation relating to parts of the hull, machinery and equipment of a ship liable to conversion or reconstruction is to be submitted to the Register for consideration.

3.2.2 In case new machinery or arrangements are to be installed in a ship in service, which are to meet the requirements of the Rules and which differ substantially from those fitted initially, additional technical documentation on new installations shall be submitted to the Register for consideration in connection with these machinery or arrangements, within a scope necessary for a ship under construction (see 3.1).

3.3 WORKING DOCUMENTATION FOR A SHIP UNDER CONSTRUCTION

3.3.1 General provisions:

.1 lists of emergency, fire extinguishing and other outfit with indication of main technical characteristics and its position in a ship; lists of spare parts and special tools. These lists are to be submitted for all sections where it is specified by the Rules;

.2 programmes of mooring tests and sea trials.

3.3.2 Hull documentation:

.1 stem and sternframe drawings;

.2 drawings of sections and details of the main hull, including decks, transverse and longitudinal bulkheads, sides, bottom, double bottom (with indication of the position of manholes and openings), tanks outside the double bottom being a structural part of the hull, etc.

.3 drawings of sections and details of superstructures and deckhouses;

.4 drawings of engine and boiler casings, coamings and sills, companions and other guards of openings in the ship’s hull;

.5 drawings of propeller shaft tunnel, recesses and escape trunks;

.6 drawings of propeller brackets and bossings;

.7 drawings of seatings for main machinery, boilers and bearings of shafting, seatings of auxiliaries, equipment and arrangements included in the nomenclature;

.8 bulwark drawings;

.9 plan of testing the hull for watertightness;

.10 plan of weld control of hull and superstructures and table of hull welding, containing the information given in 3.1.3.2.1;

.11 plan of subdivision of hull into sections;

.12 description of the basic technological process of joining hull parts afloat, based on the methods of carrying out such operations acceptable for the Register;

.13 Loading Manual for ships of 65 m and over in length (see 1.4.9, Part II "Hull");

.14 Information (booklet) on stability for the case of loading, unloading and stowage of bulk cargoes other than grain (see 1.4.9.7, Part II "Hull" of the Rules).
3.3.3 Documentation on arrangements, equipment and outfit:

.1 general arrangement plans of assemblies and parts of closing appliances in hull, superstructures and deckhouses in the subdivision bulkheads;
.2 general arrangement plans of assemblies and parts of steering gear, active means of ship’s steering, anchor, mooring and tending arrangements, as well as spar and rigging, and guard rails;
.3 general arrangement plans of assemblies and parts of bulk cargo separation fittings.

3.3.4 Documentation on stability:

Preliminary information on stability and calculations on which it is based (provided that these are not included in the documentation submitted according to 3.1.5.1 - 3.1.5.9).

3.3.5 Documentation on subdivision:

Preliminary information on emergency trim and stability and calculations on which it is based (provided that these are not included in the documentation submitted according to 3.1.6.)

3.3.6 Documentation on fire protection.

.1 arrangement plan of fire-proof divisions (doors included) with indication of numbers of their Type Approval Certificates or with the Reports containing satisfactory results of the fire test required. Plan may not be submitted within the working documentation if the plan submitted within the scope of technical design according to 3.1.7.1.1 fully complies with the present requirements;
.2 drawings of assemblies and parts of fire-protection divisions of class A and B;
.3 drawings of insulation, linings and deck coverings;
.4 structural drawings and calculations of separate typical assemblies and equipment of fire extinction and fire alarm systems;
.5 diagrams of fire-extinguishing systems;
.6 fire plans according to 1.4, Part VI "Fire Protection";
.7 structural drawing of air medium control system (for oil recovery ships).

3.3.7 Documentation on pumping and piping:

.1 ship’s system drawings:
.1.1 bilge;
.1.2 ballast;
.1.3 heeling and trimming, diagram and construction of arrangements (automatic and manually controlled) used for equalizing the damaged ship by means of counterflooding;
.1.4 air, overflow, sounding pipes, liquid level indicators, systems of remote level sounding in fuel tanks, cargo and slop tanks of the tankers;
.1.5 ventilation of accommodation, service, cargo, machinery and working spaces, construction of dampers and shut-off fittings of ventilation and other openings necessary for fire safety of the ship;
.1.6 gas vent pipes and gas vent equipment (design of flame arresters, flame-arresting gauzes, breathing valves and high-velocity devices);
.1.7 sewage, drainage and scuppers;
.1.8 cargo and stripping;
.1.9 liquid cargo heating;
.1.10 fuel oil loading and transfer system;
.1.11 liquid cargo loading and transfer system in dry cargo ships;
.2 drawings of propulsion plant piping:
.2.1 live and waste steam and blow-off pipes;
.2.2 feed water, condensate and evaporator;
.2.3 fuel oil;
.2.4 lubricating oil;
.2.5 cooling;
.2.6 exhaust manifold and uptakes;
.2.7 compressed air;
.2.8 heating system of oil fuel, water and lubricating oil; structural drawings of details and connections of heating elements;
.2.9 position and details of attachment of bottom and side fittings;
.3 structural drawings of leading the pipes and vent ducts through the watertight bulkheads, fire-proof divisions, decks and platforms.

3.3.8 Documentation on machinery and boiler installations:

.1 drawings of installation and attachment of main machinery and steam boilers;
.2 drawings of fittings of oil fuel and lubricating oil tanks;
.3 drawings of silencers and spark arresters in exhaust gas pipes and uptakes;
.4 drawings of shafting and stern tube;
.4.1 thrust, intermediate and propeller shafts;
.4.2 main and thrust bearings and their attachment;
.4.3 couplings;
.4.4 stern tube and details of stern tube arrangement (bushes, bearings, sealings);
.5 fixed-pitch propeller (together with details of fastening of blades, if detachable blade propeller is fitted);
.6 controllable pitch propeller (CPP);
.6.1 hub complete;
.6.2 blades;
.6.3 propeller shaft and fastening thereof to the hub;
.6.4 oil transfer block in assembly;
.6.5 pitch actuating mechanism complete (PAM);
.6.6 shaft of pitch actuating mechanism (PAM);
.7 drawings of installation and attachment of AMSS:
.7.1 drawings of propellers and impellers (when CPP are used, see 3.3.8.6),
.7.2 drawings of bearings and seals,
.7.3 drawings of shafts, couplings, gear wheels, pinions.

Note. For propellers not covered by the requirements of the Rules, the list of the working plans is to be agreed with the Register in each individual case.

3.3.9 Documentation on automation systems and devices:
mounting and structural drawings of blocks of automation systems and devices, sensors, alarm devices, instruments, as well as of switchboards and desks of control and monitoring.

3.3.10 Documentation on electrical equipment:
.1 diagrams of main and emergency lighting circuits in the spaces and places of arrangement of essential appliances, evacuation routes, survival craft embarkation stations at the deck and outboard (supplying from the section switchboards);
.2 cable installation drawings with indication of cable penetrations through the watertight bulkheads, decks and platforms;
.3 structural assembly drawings (for non-standard articles only) including:
.3.1 main switchboards;
.3.2 electric propulsion plant boards;
.3.3 emergency switchboards;
.3.4 control stations and desks;

.3.5 special boards;
.3.6 power and lighting switch boards;
.4 arrangement and installation drawings and diagrams of devices intended for measuring non-electric values (level, pressure, temperature indicators, etc.);
.5 drawings and diagrams of devices for suppression of radio interference;
.6 arrangement and installation drawings of electrical equipment in all ship’s rooms and spaces;
.7 corrected drawings and diagrams specified in 3.1.11.1.

3.3.11 Documentation on refrigerating plants is specified in 4.3.3.

3.4 FINAL DOCUMENTATION ON A SHIP

3.4.1 Upon completion of construction, testing and commissioning of a ship, the final documentation on a ship is to be submitted to the Register for information.
Scope and procedure of submitting the documentation are to be agreed with the Register before the completion of construction.

4 CLASSIFICATION OF REFRIGERATING PLANTS

4.1 GENERAL PROVISIONS

4.1.1 For ensuring safety of a ship and preventing ozone-destructive effect of refrigerants on environment the refrigerating plants installed in ships classed with the Register are subject to technical supervision by the Register in the following cases:
.1 refrigerating plants working with Group II refrigerants in accordance with Table 2.2.1, Part XII "Refrigerating Plants";
.2 refrigerating plants working with Group I refrigerants and comprising the compressors with theoretical suction capacity 125 m³/h and above.

4.1.2 From the number of the refrigerating plants stated in 4.1.1 the Register assigns a class to:
.1 refrigerating plants intended for developing and maintaining the required temperatures in refrigerated cargo spaces of transport ships, as well as in thermal containers to provide proper carriage of goods;
.2 refrigerating plants intended for developing and maintaining the required temperatures in refrigerated cargo spaces, for cold-treatment of sea products (cooling, freezing) and supplying the cold necessary for operation of process plants in fishing ships and other ships used for processing of the biological resources of sea;
.3 refrigerating plants intended to maintain the required conditions for transportation of liquefied gas in bulk in gas carriers.

Other refrigerating plants from the number of those stated in 4.1.1 subject to the Register supervision are considered unclassified.

4.2 CLASS OF A REFRIGERATING PLANT

4.2.1 General provisions.

4.2.1.1 The Register may assign a class to a refrigerating plant after the ship's construction, as well as assign, or renew a class of a refrigerating plant installed in a ship in service.

4.2.1.2 Assignment or renewal of a class means that the refrigerating plant fully or to a degree considered acceptable by the Register complies with the requirements of the relevant Rules. The fact of a class being assigned or renewed indicates that the refrigerating plant complies either fully or to a degree deemed acceptable by the Register, with the requirements of the relevant Rules and is taken under the
Register supervision, and that the technical condition of the plant is in accordance with the provisions of design specifications included in the Classification Certificate for the Refrigerating Plant.

4.2.1.3 Assignment or renewal of a class granted to a refrigerating plant shall be confirmed by the issue of a Classification Certificate after the supervision carried out.

4.2.2 Class notation of a refrigerating plant.

4.2.2.1 The character of classification of a refrigerating plant consists of the following marks:

- X — for a refrigerating plant built according to the Rules and under the supervision of the Register;
- XX — for a refrigerating plant built according to the Rules and under the supervision of a classification body recognized by the Register and then classed by the Register;
- (X) — for a refrigerating plant built according to the Rules and under the supervision of an IACS Member Society and afterwards classed by the Register, if a refrigerating plant does not fully comply with the requirements of Part XII "Refrigerating Plants".

4.2.2.2 Mark of a capability to cargo refrigeration.

If the refrigerating plant has a cooling capacity sufficient to refrigeration of a non-precooled cargo on board a period of time that provides preservation of that cargo, a distinguishing mark "+" shall be added in the class notation.

In such a case a note specifying the conditions of cargo cooling on board shall be entered into the Classification Certificate for the refrigerating plant and in the Register Book.

4.2.2.3 Mark of cooling and freezing arrangements in factory ships.

An additional mark P is added to the character of classification if the plant is intended for cooling or freezing sea products and is in accordance with the relevant requirements specified in Part XII "Refrigerating Plants".

4.2.2.4 Additional character letters of refrigerating plants

- 1 If a refrigerating plant is intended for cooling of cargo transported in thermal containers and complies with applicable requirements of Part XII "Refrigerating Plants" a character letter K is added to the character of classification of the plant.
- 2 If, in addition to a refrigerating plant, a ship is equipped with atmospheric control system in refrigerated spaces and/or thermal containers which complies with applicable requirements of Part XII "Refrigerating Plants" a character letter H is added to the character of classification of the plant.

4.2.3 Additional characteristics.

4.2.3.1 Additional details of conditions for cooling cargoes on board, specified temperature conditions for transportation of cargoes and other details are indicated in the Classification Certificate and in the Register of Ships if it is found necessary by the Register to specify the purpose or structural features of the refrigerating plant.

4.2.3.2 Number of thermal containers served by the refrigerating plant is indicated in the Classification Certificate for refrigerating plant and in the Register of Ships.

4.2.4 Alteration of marks in class notation.

4.2.4.1 The Register may delete or alter a mark shown in the class notation in case of any modification or non-compliance with the requirements which served as the basis for the insertion of that mark into the class notation.

4.3 TECHNICAL DOCUMENTATION OF A REFRIGERATING PLANT

4.3.1 Technical design of a refrigerating plant to be classed.

4.3.1.1 General provisions.

Before commencement of ship’s construction technical design documentation with a sufficient scope of information to prove that the requirements of the Rules of the Register for a refrigerating plant are complied with, is to be submitted for consideration to the Register. Approximate lists of technical documents to the Register are given in 4.3.1.2 and 4.3.1.3.

4.3.1.2 In the case of subsequent approval of working documentation, the following information is to be submitted:

- 1 technical description of a refrigerating plant (no approval stamps are needed);
- 2 cooling capacity calculations with indication of thermal load from each refrigerated cargo space and cold consumers (no approval stamps are needed);
- 3 general arrangement plans of a refrigerating plant on board the ship;
- 4 circuit schemes of working and emergency ventilation systems in the refrigerating machinery spaces with indication of the watertight bulkheads and fire-proof divisions, as well as the number of air changes per hour;
.5 circuit schemes of refrigerant, liquid cooling medium, cooling water systems with indication of places for installation of instruments and automatic devices;
.6 air cooling diagram with indication of watertight bulkheads and fire-proof divisions;
.7 arrangement plans of equipment in refrigerating machinery spaces with indication of escape routes;
.8 arrangement plans of equipment in refrigerated spaces with indication of places for installation of temperature control devices;
.9 construction plans of insulational refrigerated spaces with specification of insulating materials;
.10 elementary diagram of water screen system of refrigerating machinery spaces (for refrigerants of Group II);
.11 general arrangement plans of freezing and cooling arrangements and other refrigerating processing equipment;
.12 circuit schemes of automatic control, protection and alarm systems;
.13 list of machinery, vessels and apparatus of refrigerating plant with indication of technical characteristics, type (trade-mark), manufacturer and data on Type Approval Certificate (approval) of the Register (no approval stamps are needed);
.14 list of control devices and measuring instruments, protection and alarm systems with indication of technical characteristics, type (trade-mark), manufacturer and data on Type Approval Certificate (approval) of the Register (no approval stamps are needed);
.15 tables of the values of the bounding surface areas of the refrigerated cargo spaces and holds with data on calculated heat transfer coefficient for each surface (no approval stamps are needed);
.16 drawings of cargo cooling air ducts in thermoinsulated containers with an indication of the layout on board;
.17 drawings of air duct insulation with technical data of insulation materials;
.18 drawings of sealing and flexible joints with indication of details on materials;
.19 general arrangement plans of atmosphere control installation;
.20 list of equipment of the atmosphere control system including control and automatic devices and data on their approval by the Register.

4.3.1.3 The documentation specified in 4.3.1.2 is to be submitted without subsequent approval of working documentation, which is also true for the following documentation to be submitted additionally:
.1 drawings of installation and fastening of machinery, vessels and apparatus;
.2 arrangement plans of piping of refrigerant, liquid cooling medium and cooling water system with indication of places of their penetration through the bulkheads, decks and platforms;
.3 arrangement plan of emergency discharge system of refrigerant outboard;
.4 list of spare parts;
.5 test program with indication of the method of design thermal load generation (including a calculation of the power of additional heaters to be used) and the method of determining the actual averaged heat-transfer coefficient for the insulating structure of refrigerated cargo spaces.

4.3.2 Technical design of an unclassed refrigerating plant.

4.3.2.1 In the case of subsequent approval of working documentation, the documentation stated in 4.3.1.2.3 - 4.3.1.2.5 (for refrigerant only), 4.3.1.2.7, 4.3.1.2.10, 4.3.1.2.11 (only for arrangements operating under the pressure of refrigerant), 4.3.1.2.12 (only for protection and alarm system), 4.3.1.2.13, 4.3.1.2.14 (only for protection and alarm devices).

4.3.2.2 The documentation specified in 4.3.2.1, as well as the documentation stated in 4.3.1.3.1, 4.3.1.3.2 (for refrigerant only), 4.3.1.3.4, is to be submitted without subsequent approval of working documentation.

4.3.3 Working documentation on refrigerating plants:

.1 drawings of installation and fastening of machinery, vessels and apparatus;
.2 arrangement plan of refrigerant piping;
.3 arrangement plan of liquid cooling medium and cooling water piping;
.4 drawing of cooling air system;
.5 arrangement plan of thermometer pipes;
.6 drawing of water screen and water spraying systems for the refrigerating machinery spaces;
.7 arrangement plan of emergency discharge system of refrigerant outboard;
.8 instructions on maintenance and operation of refrigerating plant (no approval stamps are needed);
.9 list of spare parts;
.10 test programme.

For unclassified refrigerating plants the documentation specified in 4.3.3.1, 4.3.3.2, 4.3.3.6 and 4.3.3.7, is to be submitted.
PART II. HULL

1 DESIGN PRINCIPLES

1.1 GENERAL

1.1.1 Application.

1.1.1.1 Unless provided otherwise, the present Part of the Rules applies to steel ships and floating facilities of welded construction, from 12 to 350 m in length whose proportions are taken within the limits given in Table 1.1.1.1.

<table>
<thead>
<tr>
<th>Proportion of ship</th>
<th>Area of navigation</th>

</tbody>
</table>

\(^1\) For vessels of dredging fleet, not more than 3.
\(^2\) For vessels of dredging fleet, not more than 4.
\(^3\) For floating cranes, not less than 4.5.

1.1.1.2 The scantlings of hull members, essential to the strength of ships and floating facilities whose construction and main dimensions are not regulated by the present Rules are subject to special consideration by the Register.

1.1.2 Scope of supervision.

1.1.2.1 The general provisions for supervision of the hull are set forth in General Regulations for the Supervision.

1.1.2.2 All hull structures regulated by the present Part of the Rules shall be subject to the supervision of the Register. For this purpose an access shall be provided for their survey.

1.1.2.3 During manufacture the structures regulated by the present Part of the Rules are subject to inspection for compliance with the requirements of Part XIII "Materials" and Part XIV "Welding" and for compliance with the approved technical documentation listed in Part I "Classification".

1.1.2.4 Tightness test of ship’s hull is to be carried out according to the provisions of Appendix.

1.1.3 Definitions and explanations.

The definitions and explanations relating to the general terminology of the Rules are given in General Regulations for the Supervision and in Part I "Classification".

For the purpose of the present Part of the Rules the following definitions and explanations have been adopted:

Length \( L \) is the distance, in m, on the summer load waterline from the forward side of the stem to the after side of the rudder post or to the centre of the rudder stock if there is no rudder post, or the distance equal to 96 per cent of the length on the summer load waterline from the forward side of the stem to the after side of after end of the ship, whichever is the greater. However, \( L \) need not be greater than 97 per cent of the ship’s length on the summer load waterline.

Where the fore or after end is of an unusual form, length \( L \) is subject to special consideration by the Register.

Moulded breadth \( B \) is the greatest moulded breadth, in m, measured amidships from outside of frame to outside of frame.

Moulded depth \( D \) is the vertical distance measured amidships from the top of the plate keel or from the point where the inner surface of shell plating abuts upon the bar keel, to the top of the upper deck beam at side. In ships having a rounded gunwale, the depth is measured to the point of intersection of the moulded lines of upper deck and side, the lines extending so as if the gunwale were of angular design.

Draft \( d \) is the vertical distance measured amidships from the top of the plate keel, or the point where the inner surface of the shell plating abuts upon the bar keel, to the summer load waterline. In ships with timber freeboard the draft shall be measured at side to the summer timber load waterline.

Summer load waterline is the waterline on the level of the centre of the load line ring for the ship’s position without heel and trim.

Block coefficient \( C_b \) is the block coefficient at draught \( d \) corresponding to summer load waterline, based on length \( L \) and breadth \( B \), determined by the formula

\[
C_b = \frac{\text{Moulded displacement (m}^3\)}{LBD}
\]

Spacing is the distance between primary members, determined on the basis of the value of standard spacing \( a_0 \), in m, obtained from the formula

\[
a_0 = 0.002L + 0.48.
\]

Deviation from normal spacing may be permitted within the following limits:

- 0.75\( a_0 \) to 1.25\( a_0 \) for ships of unrestricted area of navigation and limited area of navigation I;
- 0.7\( a_0 \) to 1.25\( a_0 \) for ships of limited areas of navigation II and IIIC1;
- 0.65\( a_0 \) to 1.25\( a_0 \) for ships of limited areas of navigation III and IIIC1.

In the fore and after peaks the spacing of primary members is not to exceed 0.6 m; between the fore peak bulkhead and 0.2\( L \) aft of the forward perpendicular — not more than 0.7 m. Variations from these...
values are subject to special consideration by the Register.

In all cases the spacing of primary members is not to exceed 1 m.

Forward and after perpendiculars are vertical lines run through the foremost and aftermost ends of the length $L$, respectively, taken at the centreline.

Midship section is the hull section at the middle of ship’s length $L$.

Midship region is the part of the ship’s length equal to $0.4L$ ($0.2L$ forward and aft of amidships), unless expressly provided otherwise.

Ship’s ends are portions of the ship’s length beyond the midship region.

Machinery space aft corresponds to the position of the mid-length of the machinery space beyond $0.3L$ aft of amidships.

Upper deck is the uppermost continuous deck extending the full length of the ship.

Strength deck is the deck forming the upper flange of hull girder. The uppermost continuous deck, long bridge deck, long forecastle or long poop deck outside end regions, or quarter deck outside the transition area may be considered as the strength deck (see 2.12.1.2).

Bulkhead deck is the deck to which the main transverse watertight bulkheads are carried.

Freeboard deck is the deck from which the freeboard is calculated.

Lower decks are the decks located below the upper deck.

Where the ship has several lower decks, they are called: second deck, third deck, etc., counting from the upper deck.

Platform is a lower deck extending over portions of the ship’s length or breadth.

Superstructure deck is a deck forming the top of a tier of superstructure. Where the superstructure has several tiers, the superstructure decks are called as follows: first tier superstructure deck, second tier superstructure deck, etc., counting from the upper deck.

Deckhouse top is a deck forming the top of a tier of a deckhouse. Where the deckhouse has several tiers, the deckhouse tops are called as follows: first tier deckhouse top, second tier deckhouse top, etc., counting from the upper deck. If a deckhouse is fitted on a superstructure deck of first tier, second tier, etc., the deckhouse top is called accordingly the top of second tier deckhouse, third tier deckhouse, etc.

Superstructure is a decked structure on the upper deck extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 4 per cent of the breadth of the ship.

Deckhouse is a decked structure on the upper deck or superstructure deck with its side plating, on one side at least, being inboard of the shell plating by more than 4 per cent of the breadth of the ship.

Main frames are vertical side framing members fitted in the plane of floors or bilge brackets within a spacing of each other.

Intermediate frames are additional frames fitted between main frames.

Tight structure is a structure impervious to water and other liquids.

Specified speed of ship $v_0$ is the maximum speed of the ship, in knots, at the summer load waterline in still water at rated engine speed of propulsion plant.

\[ g = 9.81 \text{ m/s}^2 \] — acceleration due to gravity;

\[ \rho = 1.025 \text{ t/m}^3 \] — density of sea water.

1.1.4 Basic provisions for determining the scantlings of hull members.

1.1.4.1 The scantlings of hull members are regulated based on the Rule design loads, calculation methods and safety factors with due regard to corrosion allowance (see 1.1.5).

1.1.4.2 Derivation of the scantlings of hull members in the Rules is based on structural idealization using beam models subject to bending, shear, longitudinal loading and torsion having regard to the effect of adjacent structures.

1.1.4.3 For the purpose of the present Part of the Rules, the design characteristics of the material used for hull structures are to be as follows:

\[ R_{EI} = \] upper yield stress, in MPa;

\[ \sigma_n = \] design specified yield stress for normal stresses, in MPa, determined by the formula

\[ \sigma_n = \frac{235}{\eta} \]

where $\eta = $ application factor of mechanical properties of steel, obtained from Table 1.1.4.3.

\[ \tau_n = \] design specified yield stress for shear stresses, in MPa, determined by the formula

\[ \tau_n = 0.57\sigma_n. \]

<table>
<thead>
<tr>
<th>$R_{EI}$</th>
<th>235</th>
<th>315</th>
<th>355</th>
<th>390</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\eta$</td>
<td>1.0</td>
<td>0.78</td>
<td>0.72</td>
<td>0.68</td>
</tr>
</tbody>
</table>

1.1.4.4 The requirements for strength of structural members and structures as a whole aiming at determining their scantlings and strength characteristics are set forth in the Rules by assigning the specified values of permissible stresses for design normal $\sigma_p = k_\sigma \sigma_n$ and shear $\tau_p = k_\tau \tau_n$ stresses (where $k_\sigma$ and $k_\tau$ = factors of permissible normal and shear stresses respectively).
The values of \( k_x \) and \( k_z \) are given in the relevant chapters of this Part of the Rules.

1.1.4.5 The buckling strength requirements are imposed upon the structural members subject to considerable compressive normal and/or shear stresses (see 1.6.5).

1.1.4.6 The thickness of hull structural members determined according to the requirements of the present Part of the Rules is to be the minimum thickness specified for particular structures in the relevant chapters of the present Part of the Rules.

For ships of limited areas of navigation II, IICII, III and IICIII, a reduction in the thickness of hull members is permitted, but not in excess of the values to be found in Table 1.1.4.6.

<table>
<thead>
<tr>
<th>Hull members</th>
<th>Service area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web frames in way of ballast tanks</td>
<td>II and IICII 30%</td>
</tr>
<tr>
<td>Web frames in way of ballast tanks</td>
<td>III and IICIII 15%</td>
</tr>
<tr>
<td>Other hull members</td>
<td>II and IICII 10%</td>
</tr>
<tr>
<td></td>
<td>III and IICIII 20%</td>
</tr>
</tbody>
</table>

Table 1.1.4.6

In all cases, unless expressly provided otherwise, the hull member thickness is not to be less than 4 mm.

1.1.4.7 In the present Part of the Rules, the requirements for determining the hull member scantlings are based on the assumption that during the construction and service of a ship measures are taken for the corrosion prevention of the hull in accordance with current standards and other current normative documents.

In any case, the internal surfaces of seawater ballast tanks should have epoxy protective coatings or equivalent anticorrosive coatings in conformity with the manufacturer’s instructions approved by the Register. The coatings should preferably be of light colour. Where appropriate, anodic corrosion protection should also be used.

1.1.5 Corrosion allowance.

1.1.5.1 Corrosion allowance \( \Delta s \), in mm, is set for the structures whose planned service life exceeds 12 years and is determined by the formula

\[
\Delta s = u(T - 12)
\]

(1.1.5.1)

where \( u \) = average annual reduction in thickness of the member, in mm per annum, due to corrosion wear or tear, taken with regard to service conditions;

\( T \) = planned service life of structure, in years; if service life is not specially prescribed, \( T \) should be taken equal to 24.

For the structures whose planned service life is less than 12 years, \( \Delta s = 0 \).

1.1.5.2 When there are no special requirements for service conditions and means of corrosion prevention of the hull for determining the scantlings of hull members according to the Rules one should be guided by the data on the average annual reduction in thickness \( u \) of structural member given in Table 1.1.5.2 depending on the group of ships and the designation of the space.

Table 1.1.5.2 provides for division of all ships into two groups depending on corrosion wear conditions:

Group I: dry cargo ships and similar ships as regards the service conditions;

Group II: tankers, bulk carriers, combination carriers and similar ships as regards the service conditions.

For the webs separating the different purpose compartments, \( u \) is determined as the average value for adjacent compartments.

For ships of restricted service intended to operate only in fresh water basins, the value of \( u \) may be reduced 2.5 times for group I and 1.2 times for group II; for ships intended to operate in fresh water basins for a part of time, \( u \) is to be determined by linear interpolation in proportion to that part of time.

In well-founded cases on agreement with the shipowner a reduction of scantlings of certain hull members may be permitted within the limits agreed with the Register.

The reduced scantlings should be expressly indicated in hull structural drawings submitted to the Register for consideration.

For ships where the reduction of scantlings is permitted by the Register a special notation will be entered in the Classification Certificate (see 2.3.1, Part I "Classification")

1.1.5.3 The factor \( \omega_c \) taking into account corrosion allowance with regard to the cross-sectional area of the web and to the section modulus of members of rolled section is determined by the formula

\[
\omega_c = 1 + \frac{6}{W'} \frac{z_c}{W''} 
\]

where \( z_c = 0.07 + \frac{6}{W'} \) for \( W' < 200 \text{ cm}^3 \);

\[
z_c = 0.15 \left( 0.01 + \frac{1}{W''} \right) 
\]

for \( W'' = \text{section modulus of the member under consideration in accordance with 1.6.4.2} \);

for \( \Delta s \), see 1.1.5.1.

1.1.6 Requirements of international conventions to be taken into account.

1.1.6.1 Peak and machinery space bulkheads, shaft tunnels, etc. in passenger ships.

1. A fore peak or collision bulkhead shall be fitted which shall be watertight up to the bulkhead deck. This bulkhead shall be located at a distance from the forward perpendicular of not less than 5 per cent of the length of the ship \( L \). and not more than 3 m plus 5 per cent of the length of the ship \( L \) (Fig. 1.1.6.1).

2. Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g. a bulbous bow, the distances stipulated in 1.1.6.1.1 shall be measured from a point either at the mid-

---

Footnote 1: For the purpose of the present paragraph "bulkhead deck", "length of ship" and "margin line" have the meanings as defined in 1.2 of Part V "Subdivision".

length of such extension, or at a distance 1.5 per cent of the length of the ship forward of the forward perpendicular, or at a distance 3 m forward of the forward perpendicular, whichever gives the smallest measurement (see Fig. 1.1.6.1).

Where a long forward superstructure is fitted, the fore peak or collision bulkhead on all passenger ships shall be extended weathertight to the next full deck above the bulkhead deck. The extension shall be so arranged as to preclude the possibility of the bow door causing damage to it in the case of damage to, or detachment of, the bow door.

The extension required in 1.1.6.1.3 need not be fitted directly above the bulkhead below, provided that all parts of the extension are not located forward of the forward limit specified in 1.1.6.1.1 or 1.1.6.1.2.

However, in ships constructed before 1 July 1997: 

Where a sloping ramp forms part of the extension, the part of the extension which is more than 2.3 m above the bulkhead deck may extend no

1 For combination carriers and ships for the carriage of bulk cargoes, \( u = 0.15 \) mm per annum.

2 With a compartment filled with inert gas, \( u \) is increased by 10 per cent.

3 For horizontal stiffeners arranged in the upper portion having a width of 0.1 times the compartment height, \( u = 0.25 \) mm per annum.
more than 1 m forward of the forward limits specified in 1.1.6.1.1 or 1.1.6.1.2; and

4.2 where the existing ramp does not comply with the requirements for acceptance as an extension to the collision bulkhead and the position of the ramp prevents the siting of such extension within the limits specified in 1.1.6.1.1 or 1.1.6.1.2, the extension may be sited within a limited distance aft of the aft limit specified in 1.1.6.1.1 or 1.1.6.1.2. The limited distance aft should be no more than is necessary to ensure non-interference with the ramp. The extension to the collision bulkhead shall open forward. The extension shall comply with the requirements of 1.1.6.1.3 and shall be so arranged as to preclude the possibility of the ramp causing damage to it in the case of damage to, or detachment of, the ramp.

4.5 Ramps that do not comply with the above requirements shall be disregarded as an extension of the collision bulkhead.

6 In ships constructed before 1 July 1997, the requirements of 1.1.6.1.3 and 1.1.6.1.4 shall apply not later than the date of the first periodical survey after 1 July 1997.

7 An after peak bulkhead dividing the machinery space from cargo and passenger spaces forward and aft, is also to be fitted and made watertight up to the bulkhead deck.

The after peak bulkhead may, however, be stepped below the bulkhead deck, provided the degree of safety of the ship as regards subdivision is not thereby diminished.

8 In all cases stern tubes are to be enclosed in watertight spaces of moderate volume. The stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that, if flooded by leakage through the stern gland, the margin line will not be submerged.

1.1.6.2 Peak and machinery space bulkheads and stern tubes in cargo ships

.1 A collision bulkhead shall be fitted which shall be watertight up to the freeboard deck. This bulkhead shall be located at a distance from the forward perpendicular of not less than 5 per cent of the length of the ship or 10 m, whichever is the less, in separate cases other value may be permitted, but not more than 8 per cent of the length of the ship.

.2 Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g. a bulbous bow, the distances stipulated in 1.1.6.2.1 shall be measured from a point either at the mid-length of such extension, or at a distance 1.5 per cent of the length of the ship forward of the forward perpendicular, or at a distance 3 m forward of the forward perpendicular, whichever gives the smallest measurement.

.3 The bulkhead may have steps or recesses provided they are within the limits prescribed in 1.1.6.2.1 or 1.1.6.2.2.

.4 Where a long forward superstructure is fitted, the collision bulkhead is to be extended weathertight to the deck next above the freeboard deck. The extension need not be fitted directly above the bulkhead below provided it is located within the limits prescribed in 1.1.6.2.1 or 1.1.6.2.2 with the exemption permitted by 1.1.6.2.5 and the part of the deck which forms the step is made effectively weathertight.

.5 Where bow doors are fitted and a sloping loading ramp forms part of the extension of the fore peak bulkhead above the freeboard deck, the part of the ramp which is more than 2.3 m above the freeboard deck may extend forward of the limit specified in 1.1.6.2.1 or 1.1.6.2.2. The ramp is to be weathertight over its complete length.

.6 The number of openings in the extension of the fore peak bulkhead above the freeboard deck is to be restricted to the minimum compatible with the design and normal operation of the ship.

.7 Bulkheads shall be fitted separating the machinery space from cargo and passenger spaces forward and aft and made watertight up to the freeboard deck.

.8 Stern tubes shall be enclosed in a watertight space (or spaces) of moderate volume. Other measures may be taken to minimize the danger of water penetrating into the ship in case of damage to stern tube arrangements.

---

1 For the purpose of the present paragraph "freeboard deck", "length of ship" and "forward perpendicular" have the meanings as defined in 1.2 of the Load Line Rules for Sea-Going Ships.
1.1.6.3 Double bottoms in passenger ships.

.1 A double bottom shall be fitted extending from the fore peak bulkhead to the after peak bulkhead as far as this is practicable and compatible with the design and proper working of the ship.

In ships of 50 m and upwards but less than 61 m in length a double bottom shall be fitted at least from the machinery space to the fore peak bulkhead, or as near thereto as practicable.

In ships of 61 m and upwards but less than 76 m in length a double bottom shall be fitted at least outside the machinery space, and shall extend to the fore and after peak bulkheads, or as near thereto as practicable.

In ships of 76 m in length and upwards, a double bottom shall be fitted amidships, and shall extend to the fore and after peak bulkheads, or as near thereto as practicable.

.2 Where a double bottom is required to be fitted, its depth shall be in accordance with the requirements of 2.4.4.1 and the inner bottom shall be continued out to the ship’s sides in such a manner as to protect the bottom to the turn of the bilge. Such protection will be deemed satisfactory if the line of intersection of the outer edge of the margin plate with the bilge plating is not lower at any part than a horizontal plane passing through the point A at midship section, as shown in Fig. 1.1.6.3.

![Fig. 1.1.6.3](image)

.3 Small wells constructed in the double bottom in connection with drainage arrangements of holds, etc. shall not extend downwards more than necessary. The depth of the well shall in no case be more than the depth less 460 mm of the double bottom at the centreline, nor shall the well extend below the horizontal plane referred to in 1.1.6.3.2. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel. Other wells (e.g., for lubricating oil under main engines) may be permitted if the arrangements give protection equivalent to that afforded by a double bottom complying with the present paragraph.

.4 A double bottom need not be fitted in way of watertight compartments of moderate size used exclusively for the carriage of liquids, provided the safety of the ship, in the event of bottom or side damage, is not thereby impaired.

1.1.6.4 Double bottoms in cargo ships other than tankers.

.1 A double bottom shall be fitted extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

.2 The double bottom depth shall be in conformity with 2.4.4.1, and the inner bottom shall be continued out to the ship’s side in such a manner as to protect the bottom to the turn of the bilge.

.3 Small wells constructed in the double bottom, in connection with the drainage arrangements of holds, shall not extend in depth more than necessary. A well extending to the outer bottom may, however, be permitted at the after end of the shaft tunnel of the ship. Other wells may be permitted if the arrangements give protection equivalent to that afforded by a double bottom complying with the present paragraph.

.4 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired.

1.1.6.5 The freeing ports in bulwarks shall be assigned proceeding from 3.2.13 of the Load Line Rules for Sea-Going Ships.

The lower edges of freeing ports shall be arranged as near to the deck as practicable, but they shall not bear upon the sheerstrake.

In ships of 65 m in length and upwards a continuous slot shall generally be provided between the freeboard and sheerstrake edge instead of freeing ports.

1.1.6.6 Construction of watertight decks, trunks, etc. in passenger ships and cargo ships.

.1 Watertight decks, trunks, tunnels, duct keels and ventilation ducts should have a strength equal to that of watertight bulkheads fitted on the same level. Watertight ventilation ducts and trunks should be carried at least to the bulkhead deck in passenger ships and at least to the freeboard deck in cargo ships.

.2 Where a ventilation trunk passing through a structure penetrates the bulkhead deck, the trunk shall be capable of withstanding the water pressure that may be present within the trunk, after having taken into account the maximum heel angle allowable during intermediate stages of flooding, in accordance with 3.5.1.9 of Part V "Subdivision".

.3 Where all or part of the penetration of bulkhead deck is on the main ro-ro deck, the trunk shall be capable of withstanding impact pressure due to internal water motions of the trapped water on the vehicle deck.

.4 In ships constructed before 1 July 1997, the requirements of 1.1.6.6.2 shall apply not later than the date of the first periodical survey after 1 July 1997.
1.2 MATERIALS

1.2.1 General.

The materials used for hull structures regulated by this Part of the Rules are to comply with the requirements of Part XIII "Materials".

1.2.2 Steel for hull structures.

1.2.2.1 This Part of the Rules requires for the fabrication of hull structures the use of ordinary structural steel of grades A, B, D and E with upper yield stress $R_{yH} = 235$ MPa and higher tensile steel of grades A32, D32, E32 and F32 with $R_{yH} = 315$ MPa, grades A36, D36, E36 and F36 with $R_{yH} = 355$ MPa, grades A40, D40, E40 and F40 with $R_{yH} = 390$ MPa.

The application of high strength steel grades D, E, F with the upper yield stress above 420 MPa is subject to special consideration by the Register.

1.2.2.2 In case of high local stresses in the thickness direction, steel with improved mechanical through-thickness properties (Z-steel, see 3.14 of Part XIII "Materials") is to be used for the fabrication of structural members having a thickness in excess of 18 mm unless no measures are taken to structurally prevent lamellar tearing.

1.2.2.3 Where clad steel is used, the mechanical properties of the base material are not to be lower than those required for the steel grade specified in 1.2.3.1.

Hull structural steel stated in 3.2 of Part XIII "Materials" is to be used as the base material.

1.2.3 Selection of steel grades for hull structures.

1.2.3.1 Steel grades for structural members, including those intended for prolonged exposure to low service temperatures, are to be selected according to Figs 1.2.3.1-1, 1.2.3.1-2 and 1.2.3.1-3 for various categories of structural members based on the adopted design thickness of the member concerned and the design temperature of the structure determined by a method approved by the Register.

1.2.3.2 The design temperature of the structures which come constantly or periodically in contact with ambient air are expressed in terms of minimum design temperature of ambient air $T_d$.

In the absence of any other provisions, for the value of $T_d$ the minimum average daily air temperature is adopted which can take place during a five-year period of operation on the routes passing in the most unfavourable waters as regards cooling conditions.

1.2.3.3 In all cases the value of $T_d$ is not to exceed:
- $40^\circ C$ for icebreakers of categories $\text{L}19$, $\text{L}18$, $\text{L}17$ and ships with ice strengthening of categories $\text{L}Y9$, $\text{L}Y8$, $\text{L}Y7$, $\text{L}Y6$, $\text{L}Y5$;
- $30^\circ C$ for icebreakers of category $\text{L}16$ and ships with ice strengthening of category $\text{L}Y4$;
- $10^\circ C$ for ships with ice strengthening of categories $\text{L}Y3$, $\text{L}Y2$;
- $0^\circ C$ for ships with ice strengthening of category $\text{L}Y1$, as well as without ice strengthening.

1.2.3.4 An approximate determination of temperatures of structures is permitted based on the values of $T_d$ obtained by this method in accordance with the recommendations given in Table 1.2.3.4.

---

Note. For external structures of underwater portion of the hull $T_d=0^\circ C$.

1 If operation involves sailing into the mouths of northern rivers, the value of $T_d$ is not to exceed $-50^\circ C$. 
Fig. 1.2.3.1-1. Structural members of category I

Fig. 1.2.3.1-2. Structural members of category II

Fig. 1.2.3.1-3. Structural members of category III
1.2.3.5 At the design tensile stresses in the upper deck and side longitudinals (of sheerstrake) due to the still water hogging moment \( (\sigma_{\text{swh}}) \), exceeding the value 65/\( \eta \), the design temperature of longitudinals may be corrected by the value of \( AT_{\text{d}}^{\text{c}} = -10(\sigma_{\text{swh}}/65 - 1) \)°C.

1.2.3.6 The design temperature of hull structures located within the refrigerated cargo spaces is to be assumed equal to the temperature in the refrigerated cargo space.

The design temperature of the structures forming boundaries of the refrigerated cargo spaces is to be assumed as follows:

- with no insulation fitted on the side of the refrigerated cargo space, the temperature in this space;
- with insulation fitted on the side of the refrigerated cargo space and with no insulation on the other side, the temperature on the uninsulated side of the boundary in the space;
- with insulation fitted on both sides, arithmetical mean of the temperatures in the adjacent spaces.

1.2.3.7 Depending on the level and type of applied stress, presence of stress concentrations, complexity of structural design of the assemblies and the workmanship, the assumed damage consequences for safety of the ship as a whole, the structural members are grouped into three application categories according to Table 1.2.3.7.

</tbody>
</table>

\(^1\) In ships of 150 m in length and less, category II is required throughout ship’s length if the double bottom extends from side to side.

\(^2\) The portions of strength deck members referred to the given category are shown in Fig. 1.2.3.7, \( c \).

\(^3\) The portions of strength deck members referred to this category are shown in Fig. 1.2.3.7, \( a, b \).

\(^4\) Should be referred to category II throughout the ship’s length.
1.2.3.8 Structural members not mentioned in Table 1.2.3.7, whose scantlings are regulated by this Part of the Rules, are to be referred to category I.

1.2.3.9 For structures with high level of stress concentration, subject to dynamic loads (e.g. when mooring at sea) or being in combined stress state, the use of Grade D or Grade E steel may be required. Steel of Grade A is not permitted.

1.2.3.10 For members listed under items 1 — 5 of Table 1.2.3.7, the length of the midship region is taken as 0.6L (0.3L forward and aft of the midship section); for other members, this is to be chosen on the basis of 1.1.3.

1.2.3.11 For ships less than 40 m in length, steel specified for the categories of structural members outside the midship region according to Table 1.2.3.7 may be used throughout the length of the ship.

1.2.4 Aluminium alloys.

1.2.4.1 This Part of the Rules admits the following applications of aluminium alloys:
- hull, superstructures and deckhouses, if 12 < L ≤ 40 m;
- superstructures and deckhouses, if L > 40 m.

1.3 DESIGN LOADING

1.3.1 General.

1.3.1.1 This Chapter contains the basic formulae for determining the design weather loading on hull, ship acceleration at motions as well as loading from dry and liquid cargoes.

1.3.1.2 Wave impacts loading on the forward portion of the bottom and flare, loading from vehicles and deck heavy cargo as well as emergency loading are given in the chapters of the Rules pertaining to the appropriate structures.

1.3.1.3 Rules of determining the value and the load point of the design loading are specified in the appropriate chapters pertaining to particular structures. In the absence of such provisions the loading is assumed to be on the lower edge of the plate, at the middle of design span of the member or at the centre of the area taking up distributed load.

1.3.1.4 The basic parameter of design loading and accelerations on ship’s hull exposed to weather is the wave factor cw determined by the formulae:

\[ c_w = 0.0856L \text{ for } L < 90 \text{ m}, \]
\[ c_w = 10.75 - \left(\frac{200 - L}{100}\right)^{3/2} \text{ for } 90 < L < 300 \text{ m}, \]
\[ c_w = 10.75 \text{ for } 300 \leq L \leq 350 \text{ m}. \] (1.3.1.4)

1.3.1.5 For ships of restricted area of navigation the wave factor cw is to be multiplied by the reduction factor \( \varphi_r \) obtained from Table 1.3.1.5.

1.3.2 External loading on ship’s hull exposed to weather.

1.3.2.1 The design pressure \( p \), in kPa, acting on the ship’s hull exposed to weather is determined by the following formulae:

for the points of application of the loads below the summer load waterline
\[ p = p_{st} + p_w; \] (1.3.2.1-1)

for the points of application of the loads above the summer load waterline
\[ p = p_w \] (1.3.2.1-2)

where \( p_w \) = static pressure, in kPa, determined by the formula
\[ p_w = 10z_i \]
\[ z_i = \text{distance from the point of application of the load to the summer load waterline, in m;} \]
\[ p_{st} = \text{as defined in 1.3.2.2.} \]

1.3.2.2 The design pressure \( p_w \), in kPa, due to ship’s hull motion about the wave contour is determined by the following formulae:

for the points of application of the loads below the summer load waterline
\[ p_w = p_{w1} = 1.5c_w\frac{z_i}{d}; \] (1.3.2.2-1)

for the points of application of the loads above the summer load waterline
\[ p_w = p_{w2} = 7.5a_3z_i \] (1.3.2.2-2)

where \( p_{w1} = 5c_wa_3a_i; \)
for \( c_w \), see 1.3.1.4 and 1.3.1.5;
\[ a_3 = 0.8 \frac{c_w}{\sqrt{L}} \left( \frac{L}{T} + 0.4 \right) + 1.5; \]
\[ a_i = k_i \left( 1 - \frac{2a_3}{L} \right) > 0.267; \]
\( k_i = \text{factor equal to 0.8 and 0.5 for hull sections forward and aft of the midship section respectively;} \)
\( x_i = \text{distance of the considered section from the nearest fore or after perpendicular, in m;} \)
for \( z_i \), see 1.3.2.1; In any case, the product \( a_3a_i \) is not to be taken as less than 0.6.

Distribution of load \( p_w \) over the hull section contour is shown in Fig. 1.3.2.2.
1.3.3 Ship’s acceleration at motions.

1.3.3.1 Design acceleration $a$, in m/s$^2$, at motions in waves is determined by the formula

$$a = \sqrt{a_c^2 + a_p^2 + 0.4a_r^2}$$  

(1.3.3.1-1)

where $a_c$, projection of ship’s centre of gravity acceleration on the appropriate direction;

$a_p$, $a_r$ = projections of pitching and rolling acceleration on the appropriate directions at the point under consideration.

Acceleration projections for the considered member on the vertical (index $z$), horizontal-transverse (index $y$) and horizontal-longitudinal (index $x$) directions are determined by the following formulae:

$$a_{cz} = 0.1(100/L)^{1/3}g\phi_r;$$
$$a_{cy} = 0.2(100/L)^{1/3}g\phi_r;$$
$$a_{cx} = 0.2(100/L)^{1/3}g\phi_r;$$
$$a_{px} = (2\pi/T_p)^2\psi z_0;$$
$$a_{py} = 0;$$
$$a_{pz} = (2\pi/T_p)^2\psi x_0;$$
$$a_{px} = 0;$$
$$a_{px} = (2\pi/T_p)^2\phi z_0;$$
$$a_{pz} = (2\pi/T_p)^2\phi y_0;$$

where $\phi_r$ is given in Table 1.3.1.5 ($\phi_r = 1$ for ships of unrestricted service);

$T_p$ and $T_r$ = pitching and rolling periods, in s, determined by the formulae:

$$T_p = \frac{0.85L}{1 + 0.4 \sqrt{rac{S}{L}} (\frac{L}{10} + 0.4)};$$

(1.3.3.1-3)

$$T_r = dB/\sqrt{h},$$

where $c$ = numerical factor determined on the basis of the data for the ship of similar type. As a first approximation, $c = 0.8; h$ = metacentric height for the most unfavourable conditions of operation; for a ship in fully loaded condition, $h \approx 0.07L$ unless more detailed data are available.

For a tanker in ballast condition, $T_r$, as a first approximation, can be determined by the formula

$$T_r = \frac{3\sqrt{h}}{2};$$

where $\psi = \tan \theta = \text{design angle of trim, in rad, determined by the formula}$

$$\psi = \frac{0.23}{1 + L/10^2};$$

(1.3.3.1-4)

for $\phi$, see Table 1.4.4.3 ($\phi = 1$ for ships of unrestricted service);

$\theta$ = design angle of heel, in rad, determined by the formula

$$\theta = \frac{0.6}{1 + 0.5L/10^2};$$

(1.3.3.1-5)

$x_0$ = distance of the transverse plane passing through the ship’s centre of gravity, in m;

$y_0$, $z_0$ = distance of the considered point from the centreline and the horizontal plane passing through the ship’s centre of gravity respectively, in m.

If $L \leq 40$ m in Formulae (1.3.3.1-4) and (1.3.3.1-5) $L$ is to be taken equal to 40 m.

At all types of motions, the total acceleration in the vertical direction $a_z$, in m/s$^2$, can be determined by the formula

$$a_z = g \frac{0.9}{\sqrt{L}} \left(1 + k_\omega\right);$$

(1.3.3.1-6)

where $k_\omega = 1.6(1-2.5 x_1/L) \geq 0$ in the forward region;

$k_\omega = 0.5(1-3.33 x_1/L) \geq 0$ in the aft region;

For $x_1$, see 1.2.2.

If $L \geq 80$ m in Formula (1.3.3.1-6), $L$ is to be taken equal to 80 m.

1.3.4 Cargo, fuel and ballast loading.

1.3.4.1 Design pressure $p_r$, in kPa, on the grillages of cargo decks, platforms and double bottom from package cargo is determined having regard to inertia forces by the formula

$$p_r = h p_r (1 + a_z/g),$$

(1.3.4.1)

but not less than 20 kPa

where $h$ = design stowage height, in m; $p_r$ = density of the cargo carried, in t/m$^3$; $a_z$ = design acceleration in the vertical direction determined in accordance with 1.3.3.1.

1.3.4.2 The design pressure on the structures forming boundaries of the compartments intended for the carriage of liquid cargoes and ballast in tankers, the ballast tanks in dry cargo ships as well as the tanks for ballast and oil fuel is determined depending on their dimensions, the extent of filling and the height of air pipe.

By compartment is meant a tank or a part of a tank confined between the effective bulkheads. Both watertight and wash bulkheads with the total area of openings not over 10 per cent of the bulkhead area are considered as effective bulkheads.
The design pressure \( p_c \), in kPa, on the structures of fully loaded compartments is determined by the following formulae:

\[
p_c = p_e g (1 + a_c/g) z_i ,
\]

\[
p_c = p_e g (z_i + b) ,
\]

\[
p_c = p_e g (z_i + b) ,
\]

\[
p_c = p_e g (z_i + b) ,
\]

\[
p_c = p_e g (z_i + b) ,
\]

\[
\text{whichever is the greater}
\]

where \( p_e \) = cargo, ballast or fuel density, in \( \text{t/m}^3 \), whichever is appropriate;

\( a_c \) = design acceleration in the vertical direction according to 1.3.3.1;

\( z_i \) = distance, in m, from the member concerned to the deck level (tank top) as measured at the centroid;

\( \theta \) and \( \psi \) = as determined by Formulae (1.3.3.1-4) and (1.3.3.1-5); 

\( h \) = height, in m, of air pipe above deck (tank top), but is not to be less than 1.5 m for the ballast tanks of dry cargo ships and for fresh water tanks, 2.5 m for the tanks of tankers and for fuel oil and lubricating oil tanks; for small expansion tanks and for lubricating oil tanks of less than 3 m³ capacity, the minimum values of \( h \) are not stipulated;

\( p_e \) = pressure, in kPa, for which the safety valve is set, if fitted, but is not to be less than 15 kPa for the ballast tanks of dry cargo ships and for fresh water tanks, 25 kPa for the tanks of tankers and for fuel oil and lubricating oil tanks; for small expansion tanks and for lubricating oil tanks of less than 3 m³ capacity, the minimum values of \( p_e \) are not stipulated;

\( l \) and \( b \) = length and breadth, in m, of a compartment as measured at mid-height; if the values of \( l \) and/or \( b \) change abruptly over the compartment height, \( l \) and/or \( b \) are measured at mid-height of each compartment section where their variation is not appreciable; Formulae (1.3.4.2-2) and (1.3.4.2-3) are used for each measured value of \( l \) and \( b \) accordingly.

Where a compartment is to be partially filled proceeding from service conditions, with the compartment length \( l \leq 0.13l \) and compartment breadth \( b \leq 0.6b \), the design pressure \( p_c \), in kPa, for the structures mentioned below should not be less than:

For the side, longitudinal bulkheads and adjoining compartment top within 0.25 of the line of compartment top and side intersection, or of the longitudinal bulkhead

\[
p_c = p_e (5 - B/100)b ;
\]

for transverse bulkheads and adjoining compartment top within 0.25 of the line of compartment top and transverse bulkhead intersection

\[
p_c = p_e (4 - L/200)l ,
\]

where

\[
p_c = \rho_e g (1 + a_c/g) z_i ,
\]

(1.3.4.3)

but not less than 20 kPa

where \( p_e \) see 1.3.4.1:

\[ k_e = \sin \alpha \tan (45° - \phi_{e,c}) + \cos^2 \alpha , \]

or

\[ k_e = \cos \alpha , \]

whichever is the greater;

\( \alpha \) = angle of web inclination to the base line, in deg.;

\( \phi_{e,c} \) = internal friction angle of bulk cargo, in deg.;

\( a_c \) = design acceleration in the vertical direction according to 1.3.3.1;

\( z_i \) = vertical distance from the load application point to the free surface level of cargo, in m.

The pressure on the inner bottom is determined by Formula (1.3.4.3) where \( k_e = 1 \).

1.3.4.4 The design pressure from package cargo acting upon the structures in horizontal plane is determined with regard for inertia forces. In Formula (1.3.3.1-1) the acceleration in the horizontal-transverse direction is determined by the formula

\[
a_{x,y} = \sqrt{a_{x,c}^2 + (a_{y,c} + g \sin \theta)^2} ,
\]

and in the horizontal-longitudinal direction

\[
a_{x,y} = \sqrt{a_{x,c}^2 + (a_{y,c} + g \sin \psi)^2} ,
\]

where \( \theta \) and \( \psi \) are derived from Formulae (1.3.3.1-4) and (1.3.3.1-5).

1.4 LONGITUDINAL STRENGTH

1.4.1 General provisions and definitions.

1.4.1.1 The requirements of this Chapter apply to ships of unrestricted service and of restricted areas of navigation I and II, 65 m in length and upwards, as well as to ships of restricted areas of navigation II CI, III CI, and III, 60 m in length and upwards, whose proportions are stated in 1.1.1.1.

Ships with large deck openings and vessels of dredging fleet are to comply additionally with the requirements of chapters 3.1 and 3.6 respectively.

1.4.1.2 Special consideration is to be given to ships having the following characteristics:

1. proportion

\[ L/B \leq 5 ; \]

\[ B/D \geq 2,5 \] (for ships of restricted areas of navigation II, II CI, III CI and III the ratio \( B/D \) is obtained from Table 1.1.1.1); 

2. block coefficient \( C_B < 0.6 \); 

3. specified speed \( \nu_0 \) exceeding the value of \( \nu \), in knots, determined by the formula

\[ \nu = k \sqrt{L} , \]

where \( k = 2.2 \) where \( L \leq 100 \) m; 

\[ k = 2.2 - 0.25 (L - 100)/100 \text{ where } L > 100 \text{ m}. \]

Special consideration will also be given to ships carrying heated cargoes and ships of unusual design and/or type.
1.4.1.3 For longitudinal strength calculation, design loads shall include still water bending moments and shear forces, wave bending moments and shear forces, and for ships with large flare, bending moments due to wave impacts on the flare as well.

Design wave and impact loads may be calculated both from formulae given in the Rules and according to the approved procedure taking into consideration the rolling in waves, long-term distribution of wave conditions and area of navigation.

1.4.1.4 Downward shear forces are assumed to be taken as positive values and upward shear forces — as negative values. The hogging bending moments are assumed to be taken as positive values and sagging bending moments — as negative values.

For the calculation of still water bending moment and shear force, transverse loads are to be integrated in the forward direction from the aft end of $L_1$; in this case, downward loads are assumed to be taken as positive values.

The sign conventions of still water bending moment and shear force are as shown in Fig. 1.4.1.4.

\[ S = \text{actual statical moment, about the neutral axis, of the portion of the considered hull section, located above or below the level at which the thickness of the web is determined, in cm}^3; \]

\[ x = \text{distance of the considered hull section from the after perpendicular, in m.} \]

1.4.3 Still water bending moments and shear forces.

1.4.3.1 The still water bending moments and shear forces are to be calculated for all actually possible cases of weight distribution over the length of the ship including full-load and ballast conditions for departure and arrival of the ship.

As a rule, when determining the scantlings of framing members, consideration is to be given to the following loading conditions:

1. For dry cargo ships, ships with large deck opening, roll on-roll off ships, refrigerated cargo ships, bulk carriers and ore carriers: homogeneous loading conditions at maximum draught;

2. Ballast condition;

3. Special loading conditions, e.g. container or light load conditions at less than the maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions, deck cargo conditions, etc., where applicable;

4. Short voyage, where applicable;

5. Loading and unloading transitory conditions;

6. Docking condition afloat.

2 For oil tankers:

1. Homogeneous loading conditions (excluding dry and clean ballast tanks);

2. Partly loaded and ballast conditions for both departure and arrival;

3. Any specified non-uniform distribution of loading;

4. Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions;

5. Loading and unloading transitory conditions;

6. Docking condition afloat.

3 For combination carriers:

1. Loading conditions as specified for dry cargo ships and oil tankers.

1.4.3.2 The maximum absolute values of sagging and hogging bending moments $M_{sw}$ and shear force $N_{sw}$ are to be determined for any section along the ship’s length for all the still water loading conditions, which are possible in service.

The values $M_{sw}$ and $N_{sw}$ are regarded further as design values for the section under consideration.

1.4.3.3 For ships without effective longitudinal bulkheads, with non-uniform distribution of loading, i.e. alternation of loaded and empty holds, the still water shear force curve may be corrected by reducing its ordinates on transverse bulkheads by a value equal to the total of bottom longitudinal responses in way
of those bulkheads in the event of bottom bending (Fig. 1.4.3.3).

The bottom longitudinal responses in way of transverse bulkheads are to be determined on the basis of the bottom grillage calculation in accordance with 3.3.4.1. The design loads to be considered are not to include the wave loads mentioned under 1.3.2.2, the angles of heel, trim and accelerations at motions determined in accordance with 1.3.3.1.

1.4.4 Wave bending moments and shear forces.

1.4.4.1 The wave bending moment \( M_w \), in kN\( \cdot \)m, acting in the vertical plane at the section under consideration is to be determined by the formulae:

hogging bending moment

\[
M_w = 190c_w B L^2 C_h x 10^{-3} ;
\]

(1.4.4.1-1)

sagging bending moment

\[
M_w = -110c_w B L^2 (C_h + 0.7)x 10^{-3}
\]

(1.4.4.1-2)

where \( c_w \) is as determined from 3.1.4.1;

\( x \) is coefficient determined from Table 1.4.4.1 and Fig. 1.4.4.1;

\( C_h \) is as defined in 1.1.3, but not less than 0.6.

\[
\begin{array}{c|c|c}
\text{Position of section along} & \text{Table 1.4.4.1} \\
the ship’s length & \hline
\frac{x}{L} & \alpha \\
\hline
< 0.4 & 2.5 \frac{x}{L} \\
0.4 \leq \frac{x}{L} \leq 0.65 & 2.5 \frac{x}{L} \\
\frac{x}{L} > 0.65 & (1 - \frac{x}{L}) \frac{0.35}{0.35}
\end{array}
\]

1.4.4.2 The wave shear force \( N_w \), in kN, at the section concerned is to be determined by the formulae:

positive

\[
N_w = 30c_w B L (C_h + 0.7)f_1 10^{-2} ;
\]

(1.4.4.2-1)

negative

\[
N_w = -30c_w B L (C_h + 0.7)f_2 10^{-2}
\]

(1.4.4.2-2)

where \( c_w \) is as determined from 3.1.4.1;

\( C_h \) is as defined in 1.1.3, but not less than 0.6;

\( f_1 \) and \( f_2 \) are coefficients determined from Table 1.4.4.2, Figs. 1.4.4.2-1 and 1.4.4.2-2.
\[ \beta_0 = \text{angle, in deg., between a frame tangential and a vertical at the level of summer load waterline at the section within } 0.4(1 - C_b) L \leq 0.1 L \text{ from the fore perpendicular; } \]
\[
 f = \left\{ \begin{array}{ll}
 \frac{L_0}{140D_{1/4}} & \frac{1}{2\gamma^2} + 1.5 \left( \frac{L}{100} \right)^{0.75} \\
 \frac{L}{100} & \end{array} \right.
\]

\[ D_L = D + h_z \]

\[ h_z = \text{height of continuous hatch side coamings, in m (where these are not fitted, } h_z = 0); \]
\[ A = 0.045x(0.25)^2 - \frac{L}{20D_{1/4}} - \frac{L}{100}. \]

The above requirements apply to ships of restricted area of navigation, from 60 to 150 m in length. Application of the requirements to ships of a different length is subject to special consideration by the Register.

\[
\begin{array}{|c|c|}
\hline
\text{Area of navigation} & \phi \\
\hline
\text{I} & 1.1 - 0.25L \times 10^{-2} \leq 1 \\
\text{II} & 1.0 - 0.25L \times 10^{-2} \\
\text{III} & 0.94 - 0.26L \times 10^{-2} \\
\text{III} & 0.71 - 0.22L \times 10^{-2} \\
\text{III} & 0.60 - 0.20L \times 10^{-2} \\
\hline
\end{array}
\]

1.4.4.3 For ships of restricted area of navigation, the wave bending moments and shear forces determined in accordance with 1.4.4.1 and 1.4.4.2 are to be multiplied by the reduction factor \( \phi \) obtained from Table 1.4.4.3 as well as by the factors \( \phi \) and \( \psi \) determined by the following formulae:

\[ \phi = 0.95(1 + 0.05 \rho) \times 10^{-2} \]  
\[ \psi = \frac{1}{1 + A} \]  

where \( \rho = z/0.5 + 2.5 \sin h_0 \) for conventional bow shape (no bulb); \( \rho = x/(1 - x) \) for a bulbous bow; \( z = \text{waterplane area coefficient for summer load waterline; } \]

\[ \beta_0 = \text{angle, in deg., between a frame tangential and a vertical at the level of summer load waterline at the section within } 0.4(1 - C_b) L \leq 0.1 L \text{ from the fore perpendicular; } \]
\[
 f = \left\{ \begin{array}{ll}
 \frac{L_0}{140D_{1/4}} & \frac{1}{2\gamma^2} + 1.5 \left( \frac{L}{100} \right)^{0.75} \\
 \frac{L}{100} & \end{array} \right.
\]

\[ D_L = D + h_z \]

\[ h_z = \text{height of continuous hatch side coamings, in m (where these are not fitted, } h_z = 0); \]
\[ A = 0.045x(0.25)^2 - \frac{L}{20D_{1/4}} - \frac{L}{100}. \]

The above requirements apply to ships of restricted area of navigation, from 60 to 150 m in length. Application of the requirements to ships of a different length is subject to special consideration by the Register.

\[
\begin{array}{|c|c|}
\hline
\text{Area of navigation} & \phi \\
\hline
\text{I} & 1.1 - 0.25L \times 10^{-2} \leq 1 \\
\text{II} & 1.0 - 0.25L \times 10^{-2} \\
\text{III} & 0.94 - 0.26L \times 10^{-2} \\
\text{III} & 0.71 - 0.22L \times 10^{-2} \\
\text{III} & 0.60 - 0.20L \times 10^{-2} \\
\hline
\end{array}
\]

1.4.5 Bending moment due to wave impacts on the flare.

1.4.5.1 The bending moment due to wave impacts on the flare is to be calculated only for ships of length from 100 to 200 m where the relationship \( A_F/L \times Z_F \geq 0.1 \) is satisfied.

1.4.5.2 The sagging bending moment due to wave impacts on the flare \( M_F \) is to be calculated as follows:

\[ M_F = -k_F c_w B L^2 (C_b + 0.7) z_F x_F^3 \]  

\[
\begin{array}{|c|c|}
\hline
\text{Position of section along the ship's length} & \text{Z}_F \\
\hline
x/L \leq 0.15 & 0.667x/L \\
0.15 < x/L < 0.45 & 0.1 + 3(x/L - 0.15) \\
0.45 \leq x/L \leq 0.75 & 1 \\
x/L > 0.75 & 1 - 4(x/L - 0.75) \\
\hline
\end{array}
\]
1.4.5.3 For ships of restricted area of navigation, the bending moment due to wave impacts on the flare \( M_F \) calculated in accordance with 1.4.5.2 is to be multiplied by the reduction factor \( \varphi \) determined from Table 1.4.4.3. For ships of restricted areas of navigation III CII and III \( M_F = 0 \).

1.4.6 Hull section modulus and moment of inertia.

1.4.6.1 The requirements of this paragraph regulate the hull section modulus and moment of inertia about the horizontal neutral axis.

1.4.6.2 The hull section modulus (for deck and bottom) \( W \), in \( \text{cm}^3 \), at the section concerned is not to be less than:

\[
W = \frac{M_F}{\sigma} \cdot 10^3 \quad (1.4.6.2)
\]

where \( M_F = |M_{sw} + M_w| \) — design bending moment, in \( \text{kN} \cdot \text{m} \), at the section concerned equal to the maximum absolute value of algebraic sum of \( M_{sw} \) and \( M_w \) components at this section;

for \( M_{sw} \), see 1.4.3, in \( \text{kN} \cdot \text{m} \);

for \( M_w \), see 1.4.4;

\( \sigma = \frac{175}{\eta} \) MPa.

1.4.6.3 In cases specified by 1.4.3.4 the section modulus \( W \) determined in accordance with 1.4.6.2 is to be multiplied by the factor \( m \) obtained from the formula

\[
m = 1 + \frac{M_{\text{min}}}{10M_{sw}} \left( \frac{M_{\text{sw}}^{\text{max}} - M_{\text{sw}}^{\text{min}}}{0.076c_{sw}BL(C_h + 0.7)} - 1 \right) \quad (1.4.6.3)
\]

but not less than 1.

Here \( M_{\text{sw}}^{\text{min}} \), \( M_{\text{sw}}^{\text{max}} \) = absolute values of hogging and sagging bending moments at the maximum range section, in \( \text{kN} \cdot \text{m} \) (see Fig. 1.4.3.4).

1.4.6.4 For ships for which the bending moment due to wave impacts on the flare (see 1.4.5) is to be considered the section modulus \( W \), in \( \text{cm}^3 \), at the section concerned is not to be less than:

\[
W = \frac{M_T}{\sigma} \cdot 10^3 \quad (1.4.6.4)
\]

where \( M_T = |M_{sw} + M_w + M_F| \) — design bending moment, in \( \text{kN} \cdot \text{m} \), at the section concerned equal to the maximum absolute value of algebraic sum of \( M_{sw} \), \( M_w \) and \( M_F \) components at this section;

\( M_{sw} \) = maximum still water sagging bending moment or minimum hogging bending moment if solely the hogging bending moments occur at this hull section, in \( \text{kN} \cdot \text{m} \);

\( M_w \) = wave sagging bending moment (see 1.4.4);

\( M_F \) = as determined from 1.4.5;

for \( \sigma \), see 1.4.6.2.

1.4.6.5 The hull section modulus determined from 1.4.6.2 — 1.4.6.4 for maximum value of design bending moment is to be maintained within \( 0.4L \) amidships. However, if the maximum design bending moment occurs outside \( 0.4L \) amidships, the steady section modulus requirement is applicable over the ship’s length up to the section where maximum design bending moment acts.

The section modulus is to be gradually reduced towards the ship’s ends outside the region in which it is being maintained.

1.4.6.6 For sharp-lined ships without middle-body, deviation from the requirements of 1.4.6.5 may be permitted on agreement with the Register.

1.4.6.7 In any case, the hull section modulus, in \( \text{cm}^3 \), within the midship region (for deck and bottom) is not to be less than:

\[
W_{\text{min}} = c_{sw}BL(C_h + 0.7) \eta \quad (1.4.6.7-1)
\]

where for \( c_{sw} \), see 1.3.1.4.

For ships of restricted area of navigation, the minimum hull section modulus, in \( \text{cm}^3 \), within the midship region (for deck and bottom) is not to be less than \( W_{\text{min}} \), or \( W_{\text{min}} \), whichever is the greater, determined by the following formulae:

\[
W_{\text{min}} = \varphi W_{\text{min}}; \quad (1.4.6.7-2)
\]

\[
W_{\text{min}} = 0.95\varphi W_{\text{min}} \quad (1.4.6.7-3)
\]

where for \( \varphi \), see Table 1.4.4.3;

for \( W_{\text{min}} \), see Formula (1.4.4.3-1); for \( W_{\text{min}} \), see Formula (1.4.4.3-2).

1.4.6.8 scantlings of all continuous longitudinal members of hull girder based on the section modulus requirement in 1.4.6.7 are to be maintained within \( 0.4L \) amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the \( 0.4L \) part, bearing in mind the desire not to inhibit the vessel’s loading flexibility.

1.4.6.9 The moment of inertia of hull section \( I \), in \( \text{cm}^4 \), within the midship region is not to be less than:

\[
I_{\text{min}} = 3c_{sw}BL(C_h + 0.7) \quad (1.4.6.9)
\]

where \( c_{sw} \) = as determined from 1.3.1.4.
For ships of restricted area of navigation, $I_{\text{max}}$ is to be multiplied by the reduction factor $\phi_0$ determined by the formula

$$\phi_0 = \phi \eta \frac{18}{(L/D)_{\text{max}}}$$

where for $\phi$, see Table 1.4.4.3;
for $\eta$, see 1.4.3;

$(L/D)_{\text{max}}$ = maximum permissible value of $L/D$ for the area of navigation under consideration, obtained from Table 1.1.1.1.

1.4.7 Thickness of side plating and continuous longitudinal bulkhead plating.

1.4.7.1 The thickness of side plating $s$, in mm, at the considered section over the length and depth of the ship where longitudinal bulkheads are not fitted is not to be less than:

$$s = 0.5(N_{\text{cv}} + N_{\text{c}}) \frac{S}{T} \times 10^2$$  \hspace{1cm} (1.4.7.1)

where $N_{\text{cv}}$ = as defined in 1.4.3.2, in kN;
for $N_{\text{c}}$, see 1.4.4.2 and 1.4.4.3;
$T = 110/\eta$ MPa.

1.4.7.2 The thickness of side plating $s_i$ and thickness of longitudinal bulkhead plating $s_i$, in mm, at the section under consideration for ships with two plane longitudinal bulkheads are not to be less than:

$$s_i = \frac{N_{\text{cv}} + N_{\text{c}}}{\tau} \frac{S}{T} x_i \times 10^2$$ \hspace{1cm} (1.4.7.2-1)

$$s_i = \frac{N_{\text{cv}} + N_{\text{c}}}{\tau} \frac{S}{T} x_i \times 10^2$$ \hspace{1cm} (1.4.7.2-2)

where for $N_{\text{cv}}, N_{\text{c}}$, see 1.4.7.1;
$x_i = 0.16 + 0.08 s_i/s_i$;
$x_i = 0.34 - 0.08 s_i/s_i$.

1.4.7.3 For ships having one or more than two continuous plane longitudinal bulkheads as well as longitudinal bulkheads with horizontal corrugations the required thickness of side plating and members in question is to be calculated according to the procedure approved by the Register.

Appropriate calculation may also be required for ships with two continuous longitudinal bulkheads if the transverse distribution of load is substantially different from uniform distribution.

1.4.8 Calculation of actual hull section modulus.

1.4.8.1 The hull section modulus is determined:
for strength deck $W_{S_i}$, at moulded deck line at side (lower edge of deck stringer);
for bottom $W_{B_i}$, at moulded base line (top of plate keel);

For ships with continuous longitudinal strength members above strength deck including trunk and continuous hatch side coamings, $W_{S_i}$ is calculated by dividing the moment of inertia of hull section about the horizontal neutral axis by the value of $z_i$ determined by the formula

$$z_i = z(0.9 + 0.2 y/B)$$

where $z$ = distance from neutral axis to the top of continuous strength member above deck included in the calculation of $W_{S_i}$ in m;
$y$ = horizontal distance from the centreline of the ship to the top of continuous strength member above deck included in the calculation of $W_{S_i}$ in m.

$z$ and $y$ are to be measured to the point giving the largest value of $z_i$.

1.4.8.2 When calculating the hull section modulus, all continuous longitudinal strength members are to be taken into account, including continuous hatch side coamings, and, where the ship’s design provides for multiple hatchways — the longitudinal deck strips between them on condition the deck strips are effectively supported by longitudinal bulkheads, including the topside tank bulkheads (inner skins).

The sectional area of long bridges or deckhouses is to be included with the reduction coefficient which similarly to stresses in the ship’s hull and superstructure (deckhouse) is determined according to the procedure approved by the Register.

Continuous hatch side coamings in ships with single hatches not above the mentioned structures may be included in the calculation of the hull section modulus only if the calculation has been specially approved to this effect.

The sectional area of longitudinal deck strips, each being of a uniform width throughout the length, including deck plating with longitudinal framing and hatch side coamings not supported by longitudinal bulkheads, is included with the reduction coefficient $\xi$ determined by the formula

$$\xi = m + \frac{0.65 + C_k}{3} \frac{L}{\Sigma l_i + \Delta l_i + \Delta l_2}$$ \hspace{1cm} (1.4.8.2)

where $m = f - 0.10$ at $n = 1$;
$f = 0.12$ at $n = 2$;
$n$ = number of longitudinal strips over ship’s breadth;
$\Sigma l_i$ = total length of longitudinal deck strips, in m;
$\Delta l_i, \Delta l_2$ = length of end attachments of longitudinal deck strips aft and forward, in m.

If the end of the longitudinal deck strip is effectively attached to continuous deck and/or longitudinal bulkhead (Fig. 1.4.8.2),

$$\Delta l_{i,2} = 4f/B_{i,2} s_{d_{i,2}}$$

where $f$ = sectional area of one longitudinal deck strip, in cm$^2$;
$B_{i,2}$ = breadth of ship in way of longitudinal deck strip termination, in m;
$s_{d_{i,2}}$ = average thickness of the portion of deck plating between the extension of longitudinal deck strip and ship’s side along the effective attachment, in mm.

Where a longitudinal deck strip terminates at the transverse deck strip, provided $10b'/b' \geq n$ and $b' > b$

$$\Delta l_{i,2} = 1.3a f/10b' (b'/b'' + 1)$$

where $a = \text{average plate thickness of the transverse deck strip, in mm}$;
$b''$ = distance between longitudinal edge of the hatch opening and symmetry plane of the longitudinal deck strip, in m;
$b' = \text{length of transverse deck strip, in m}$.
1.4.8.3 Large openings, i.e. openings exceeding
2.5 m in length and/or 1.2 m in breadth, and scallops,
where scallop-welding is applied, are to be deducted
from the sectional areas used in the section modulus
calculation.

Smaller openings (manholes, lightening holes,
single scallops in way of welds, etc.) need not be
deducted, if the following conditions are met:

the sum of their breadths and shadow area breadths (Fig. 1.4.8.3) in one transverse section of the hull does not exceed 0.06 \( B - \Sigma b \) (where \( \Sigma b \) is the total breadth of openings) or does not reduce the section modulus at deck or bottom by more than 3 per cent;

the height of lightening holes, drain holes and single scallops in longitudinal members does not exceed 25 per cent of the web depth, and the height of scallops in way of welds is not over 75 mm.

1.4.8.4 Where continuous longitudinal members
are built of higher tensile steel, they are to extend so
far beyond amidships towards the ends as to provide
a hull section modulus in way where the yield stress
changes not less than required for an identical hull of
ordinary steel.
1.4.8.5 The continuous longitudinal members at a distance from horizontal neutral axis of hull section greater than

\[ z = \frac{W_a}{\eta W_{\eta-1}} \]

are to be made of steel with the same yield stress as the strength deck (continuous hatch coaming) or bottom.

Here \( z \) = distance of strength deck (upper face plate of continuous hatch side coaming) or bottom from neutral axis, in m;
\( \eta = \) factor given in Table 1.1.4.3 for the members of the remainder of hull section;
\( W_a, W_{\eta-1} = \) actual section modulus and Rule section modulus with \( \eta = 1 \) for the deck (continuous hatch coaming) or bottom respectively.

1.4.9 Loading control facilities.
1.4.9.1 By loading control facilities are meant Loading Manual and loading instrument by means of which it can be ascertained that the still water bending moments, shear forces, and the still water torsional and lateral loads, where applicable, in any load or ballast condition will not exceed the specified permissible values.

1.4.9.2 Ships to be provided with loading control facilities are categorized as follows:

Category I:
ships with large deck opening, for which combined stresses due to vertical and horizontal hull girder bending, as well as torsional and lateral loads, have to be considered.
ships for which uneven loading, i.e., uneven distribution of cargo and/or ballast, is possible. Ships of less than 120 m in length, which design takes uneven distribution of cargo or ballast into account, belong to category II.
chemical tankers and gas carriers.

Category II:
ships with arrangement giving small possibilities for variation in cargo and ballast distribution, ships on regular and fixed trading pattern where the Loading Manual gives sufficient guidance and in addition ships not falling under category II.

1.4.9.3 A Loading Manual is a document approved by the Register which describes:
the loading conditions on which the design of the ship has been based;
permissible limits of still water bending moment and shear force and, where applicable, limitations due to torsional and lateral loads;
the results of the calculations of still water bending moments, shear forces for loading conditions stated in 1.4.3.1;
the allowable local loadings for the structure (hatch covers, decks, double bottom, etc.).

1.4.9.4 A loading instrument is an instrument approved by the Register, which is either analog or digital by means of which the still water bending moments, shear forces and torsional and lateral loads, where required, in any load or ballast condition can be easily and quickly checked at specified readout points.

The number and position of sections and permissible still water bending moments and shear forces as well as the limitations due to torsional and lateral loads are to be approved by the Register.

Single point loading instruments are not acceptable.
An approved operational manual is to be provided for the loading instrument.

1.4.9.5 All ships other than category II ships of less than 90 m in length, which deadweight is not greater than 30 per cent of summer loadline displacement, are to be provided with the Loading Manual approved by the Register. In addition to the Loading Manual all ships of category I are additionally to carry a loading instrument approved by the Register (requirements for the approval are to be found in Collection of Regulating Documents of the Register No.9).

1.4.9.6 For bulk carriers, ore carriers, ore-oil carriers and oil-bulk carriers having a length of 150 m and more, additional requirements for strength control during loading are to be found under 3.3.6.

1.4.9.7 Information (booklet) on stability and strength during loading, unloading and stowage of bulk cargoes other than grain.

To prevent excessive hull stresses, provision should be made for Information (booklet) on stability and strength during loading, unloading and stowage of bulk cargoes other than grain to be carried on board, including the following as a minimum:

1. stability data required in 1.4.11.4 of Part IV "Stability";
2. data on the capacity of ballast tanks and of equipment for their filling and emptying;
3. maximum permissible load upon a unit of double-bottom plating surface;
4. maximum permissible cargo hold load;
5. general instructions concerning loading and unloading and pertinent to hull strength, including any limitations due to the worst operating conditions during loading, unloading, handling of water ballast, and during the voyage;
6. any special limitations, for instance, those due to the worst operating conditions, where applicable;
7. where necessary — strength calculations: maximum permissible forces and moments affecting the hull during loading, unloading and the voyage.

The Information (booklet) is to be drawn up in the language familiar to the ship officers, and in English.
1.5 VIBRATION OF HULL STRUCTURES. VIBRATION STANDARDS

1.5.1 General.

1.5.1.1 Main and local hull vibration may be determined for a preliminary assessment of vibration parameters at the design stage. Irrespective of the results of vibration calculations for the first ship of a series or for single buildings, vibrations are to be measured in order to determine the vibrational characteristics of ships proceeding from the standards of permissible vibration parameters given in 1.5.7.

The measurement procedure stipulating the scope and sequence of measurements is to be approved by the Register.

1.5.1.2 The standards of permissible parameters of the main hull vibration of ships under way and local vibration of hull structures are the basic criterion for an estimate of their vibration characteristics. The standards have been established proceeding from the condition of ensuring the strength of hull structures.

Besides the purposes of 1.5.1.1, the vibration standards may be used for evaluation of vibration in ships being designed by comparing them with the appropriate calculation results (see 1.5.5).

Application of the present standards does not dispense from compliance with the sanitary standards and the requirements of the Ministry of Public Health concerning the admissible parameters of vibration at the working positions and in the ship’s accommodation, service and other spaces.

1.5.2 Application.

The requirements of this Chapter specifying the procedure of performing the calculations of the main hull vibration (see 1.5.3) apply to sea-going displacement ships with metal hull of 80 m in length and above.

1.5.3 Definitions.

For the purpose of the present Chapter:

"Main hull vibration" means vibration of ship’s hull generated by the forces involved on account of operation of propeller, main engine or caused by the action of waves.

"Vibration of superstructures and deckhouses" means vibration of superstructures and deckhouses about the hull generated by its vibrations (mainly, bending and longitudinal).

"Local vibration" means vibration of hull structures (plates, stiffeners, framing members, grilles, etc.) generated by propeller, unbalanced machinery located near these structures or by the main hull vibration of the ship under way.

"Exciting forces" means any external forces or moments of forces acting on vibrating system and causing its vibration.

"First-order frequency" means frequency of exciting forces variation equal to the propeller speed. Forced vibration of the system arising at this frequency is called first-order vibration.

"Top-order frequencies" means frequencies of exciting forces variation equal to the doubled, trebled, etc. propeller speed. Forced vibration of the system arising at such frequencies multiple to propeller speed is called vibration of the second, third, etc., order, respectively. In this case frequency of exciting force variation equal to the product of propeller speed by the number of blades is called first-blade (or blade); frequencies multiple to it are called second-blade, third-blade, etc., and vibration arising at these frequencies, for example, in case of four-bladed propeller is called blade vibration of the fourth order, second-blade vibration of the eighth order, etc., respectively.

"Main order frequencies of exciting forces generated by internal combustion engines" means frequencies of variation of unbalanced forces and moments of inertia forces equal to the engine crankshaft speed (first order) or double speed (second order) as well as frequencies of variation of capsizing moments the order of which is equal to the cylinder number (two-stroke engines) or to half the number of cylinders (four-stroke engines).

1.5.4 Technical documentation.

Upon completion of mooring and sea trials the technical conclusion on the results of vibration measurements is to be submitted to the Register. The technical conclusion is to be approved by the management of the organization conducting the measurements and is to contain the assessment of ship vibration characteristics proceeding from the existing standards. This document includes the information on arrangements to be carried out with a view to reducing the vibration as well as on check (repeated) measurements used for confirmation of efficiency of the arrangements.

In separate cases, the Register reserves the right to require the preliminary conclusion of the enterprise taking measurements of vibration.

1.5.5 Calculation of main hull vibration of the ship under way.

1.5.5.1 Calculations of frequencies and basic modes of natural frequencies of hull vibration for ship being designed as well as estimation of parameters of its forced vibration under way are carried out according to the procedure approved by the Register.

1.5.5.2 Calculations of main hull vibration of the ship under way are to be carried out for the main operating loading conditions.

The calculation of natural (resonant) frequency spectra of hull vibration in vertical and horizontal-transverse directions within the range of inducing forces frequency variation to the blade frequency inclusive is to be made.

In this case for horizontal-transverse vibrations of hull of dry cargo ships, as a rule, consideration is
to be given to their interdependency with torsional vibrations; deviations may be permitted on special agreement with the Register. When calculating the natural frequency of vibration, it is recommended to take into account the interaction of hull and added large masses (grillages, deckhouses, etc.). For the top mode vibrations (generally, above the third mode) account of such interaction is necessary.

In addition, the amplitude estimation of vibration displacement of the hull forced vibration (including resonant) is to be carried out in the aftermost section at the point where vibration is normalized. Such estimation is carried out for the main specified running conditions. The obtained values are compared with the values specified in 1.5.7.

1.5.6 Calculation of local vibration of hull structures.

1.5.6.1 The local vibration strength of the hull structures subject to vibration loads is checked by the appropriate calculations performed at the designing stage according to the procedure approved by the Register.

1.5.6.2 The basic condition of ensuring the vibration strength of hull structures in way of influence of vibration loading is to prevent the possibility of origination of their resonance oscillations for the main operating conditions of the ship.

In this case, only local vibration calculation is to be made to evaluate the lowest natural frequencies of hull structure vibration and to correlate them with the relevant frequencies of excitation forces listed in 1.5.6.7. When comparing these frequencies, one should be guided by conditions of prevention of resonant phenomena stated in 1.5.6.6.

1.5.6.3 For the hull structures in way of direct influence of pulsating pressures from propellers (see 1.5.6.4.1) as well as for the structures in way of unbalanced machinery (see 1.5.6.4.3) in addition to the calculations specified by 1.5.6.2 it is recommended to make additional calculations of their forced vibration under the action of forces with the blade frequency (for the region stated in 1.5.6.4.1) or with the rotor speed (for rotor-type machinery), or with the first- and second-order frequencies for internal combustion engines (as applied to the region according to 1.5.6.4.3). These calculations are carried out to determine the vibration stresses arising in the plates and framing members which are to be correlated with the standards given in Table 1.5.7.2.4.

Note. When the propeller is located in the nozzle, the calculations of forced vibration of hull structures of the after end of the ship according to 1.5.6.4.1 need not be performed. However, in this case it is necessary to carry out the estimation of the local vibration strength of structures of the nozzle itself according to 1.5.6.2.

1.5.6.4 Calculations specified in 1.5.6.2 are to be performed for the hull structures arranged in the following regions of the ship:

- in way of the direct influence of pulsating hydrodynamical pressures from propellers; this region extends from the aftermost section (transom) to the section located at a distance equal to single propeller diameter forward of the disc centre of the latter;
- in machinery spaces in way of unbalanced main and auxiliary machinery;
- in other spaces in way of unbalanced machinery.

1.5.6.5 To be calculated according to 1.5.6.4 under vibration loading are the following structures:
- after peak structures (see also 1.5.6.4.1) — shell plating with associated framing, inner bottom plating, bulkhead plating and stiffeners, plating and stiffening of platforms;
- engine room structures similar to those listed in 1.5.6.5.1;
- structures of other ship spaces in way of unbalanced machinery similar to those listed in 1.5.6.5.1.

1.5.6.6 To prevent origination of the resonance vibration, natural frequencies of the first mode hull structure vibration are to exceed the relevant frequencies of the excitation forces specified in 1.5.6.7 at least 1.5 times for the plates and 1.3 times for the framing members and stiffeners.

1.5.6.7 When determining the possibility of origination of resonance vibration of hull structures, the frequencies of excitation forces are to be taken equal to:
- double blade frequency corresponding to the range of full speed of the ship for the structures subject to direct action of pulsating pressures from propellers (see 1.5.6.4.1). As an exception and on special agreement with the Register the blade frequency may be used as design frequency of the excitation forces for the structures stated in 1.5.6.4.1;
- blade frequency corresponding to the range of full speed of the ship for the structures of engine room (where located aft) as well as for the hull part between the engine room and region according to 1.5.6.4.1. Where the engine room is located amidships or displaced aft the frequencies corresponding to the first and second orders of variation of unbalanced forces of main and auxiliary machinery are taken as design frequencies;
- the first and second orders of frequencies of unbalanced forces of unbalanced machinery for the structures in way of this machinery.

1.5.7 Vibration standards.

1.5.7.1 Standard vibration parameters:
- the root-mean-square value of the vibration rate measured in 1/3-octave band is taken as the basic parameter characterizing the vibration.

Vibration measurement in the octave band is permitted together with analysis in 1/3-octave band.

- the measured parameters may be the root-mean-square value of vibration acceleration together with vibration rate and, in well-grounded cases, the root-mean-square or peak values of vibration displacement.
.3 The vibration parameters are measured in absolute units or in the appropriate logarithmic level unit — in decibels about the standard threshold limit values of vibration rate or acceleration equal to $5 \times 10^{-4}$ mm/s and $3 \times 10^{-2}$ m/s².

1.5.7.2 Permissible values of vibration:

.1 Main hull and superstructure vibration and local vibration of ship structures are considered permissible if the root-mean-square values of vibration rate or vibration acceleration measured in $1/3$-octave band do not exceed the values (levels) stated in Table 1.5.7.2.1 (Fig. 1.5.7.2.1) for each of three interperpendicular directions about ship axes: vertical, horizontal-transverse and horizontal-longitudinal (main vibration) or for the direction normal to the structure plane (plate members, panels, grilles and their girders and stiffeners) or for the direction corresponding to the lowest bending rigidity for isolated girders and beam members (local vibration).

.2 When measuring the vibration in octave bands the permissible levels (values of the measured parameter may be increased $\sqrt{2} = 1.41$ times (by 3 dB) as compared with the values given in 1.5.7.2.1 for the bands with mean-geometric frequencies of 2, 4, 8, 16, 31.5 and 63 Hz.

.3 Permissible values of the vibration parameters (levels) stated in 1.5.7.2.1 and 1.5.7.2.2 are not to be exceeded in specified ranges of ship speed (including the range without speed if such range is a specified one) under operating loading conditions.

.4 For the plates and framing members, exceeding of permissible values (levels) is allowed provided the vibration strength of these structural members is found to be sufficient and the vibration of the equipment contacting with the members in question is considered allowable.

The local vibration strength of plates and framing members is considered to be sufficient if the values of the vibration stresses therein do not exceed the permissible values given in Table 1.5.7.2.4.

.5 Deviations from these standards may be permitted on agreement with the Register.

1.6 REQUIREMENTS FOR SCANTLINGS OF HULL STRUCTURAL MEMBERS

1.6.1 General.

1.6.1.1 This Chapter contains general requirements for plating and framing.

1.6.1.2 "Plate structure" means a portion of plating bounded by stiffening members.

By plate structures are meant portions of the deck, platform and inner bottom plating and portions of the bottom, side, bulkhead plating as well as webs of deep members.

1.6.1.3 In the present Part of the Rules the term "framing" includes primary members and deep members strengthening the plate structures. Deep members also serve as supporting structures for primary members.

</table>

$^1$ Places of intersection of decks with strong transverse and longitudinal bulkheads, sides, transom, sides of superstructure, etc.

$^2$ Including supporting girders under foundations for machinery, apparatuses and equipment.
Fig. 1.5.7.2.1.

Vibration standards for hull, superstructures and ship structures (the root-mean-square values):

1 — rigid members of hull and superstructure;
2 — framing members including supporting girders under foundations for machinery, apparatuses and equipment;
3 — plates

Primary members are deck longitudinals, side longitudinals, bulkhead longitudinals, inner bottom plating and bottom longitudinals, as well as vertical and horizontal stiffeners of bulkheads, frames, beams, reverse and bottom frames of bracket floors, etc.

Deep members are deck transverses, deck girders, web frames, side stringers, floors, side girders, centre girder, vertical webs and horizontal girders of bulkheads, etc.

1.6.1.4 The scantlings of primary and deep members are based on the required section modulus, moment of inertia, web sectional area, thicknesses of web and face plate, as well as width of the face plate.

Geometric properties of the member section, unless stated otherwise, are determined taking into account the effective flange.

**Notes:**
1. This Table shows permissible stresses for T-connections with double welds.
2. The maximum vibration stresses $\sigma$, in MPa, acting in the plates may be estimated by the formulae:
   - for steel plates
     $$\sigma = 3.5\frac{f_s}{s^2};$$
   - for aluminium alloy plates
     $$\sigma = 1.2\frac{f_s}{s^2};$$
   where $f_s$ = amplitudes of vibration in the centre of plate and its contour, in mm;
   $s$ = thickness of plate, in mm;
   $a$ = length of short side of plate, in m.
3. The maximum vibration stresses $\sigma$, in MPa, acting in the framing members can be estimated by the formulae:
   - for steel framing members
     $$\sigma = 64\frac{I}{W_{min}};$$
   - for members of aluminium alloy
     $$\sigma = 25\frac{I}{W_{min}};$$
   where $I$ = moment of inertia of member section, in cm$^4$;
   $f_s = f_{mc} - f_{c}$;
   $f_{mc}$ = vibration amplitude of the member in mid-span normal to the grillage, in mm;
   $f_{c}$ = as defined in Note 2;
   $l$ = length of beam between supports, in m;
   $W_{min}$ = minimum section modulus of the member, in cm$^3$.

If the member is so arranged that it is not normal to the effective flange, the section modulus is to be increased in proportion to $1/\cos \alpha$ (where $\alpha$ is the angle, in degrees, between the member web and the perpendicular to the effective flange at the section considered. If $\alpha \leq 15^\circ$, no increase of section modulus is required.

1.6.1.5 Rounding off the required scantlings of structural members is generally to be made in the direction of increase. Plate thickness is to be rounded off to the nearest 0.5 or integer of millimetres.

The values of negative rolling tolerances for plates are to comply with the requirements of 3.2.7, Part XIII "Materials".

1.6.2 Symbols.
- $l$ = span of concerned member, determined from 1.6.3.1, in m;
- $p$ = design pressure at the point of load application, determined in the relevant chapters of the present Part of the Rules, in kPa;
- $a$ = spacing, in m, of concerned primary or deep members of longitudinal or transverse framing system where this varies, $a$ is a half-sum of distances of adjacent members from the member concerned;
- $h$ = depth of the member web, in cm;
- $I$ = actual moment of inertia of the hull about the horizontal neutral axis, in cm$^4$;
- $z_i$ = vertical distance from horizontal neutral axis of ship to the centre of section area of the longitudinal considered, in m;
- $\sigma_n$ = design specified yield stress for normal stresses, in MPa, determined from 1.1.4.3;
- $\tau_n$ = design specified yield stress for shear stresses, in MPa, determined from 1.1.4.3;

$As$ = corrosion allowance, in mm, determined from 1.1.5.1.

1.6.3 Span and effective flange of member.

1.6.3.1 The span of primary and deep member $l$ is measured along the member face plate as the distance between its span points. Unless provided otherwise, where the end brackets are fitted, the span points are to be taken at the mid-length of the bracket. In this case, the span point position is to be such that the height of the end bracket in it does not exceed the web depth of the member considered (Fig. 1.6.3.1).

![Fig. 1.6.3.1](image)

For curvilinear members the span is to be taken equal to the chord connecting the span point centres.
1.6.3.2 The thickness of the effective flange is taken equal to its mean thickness in the considered section of the member.

1.6.3.3 The width of the effective flange $a_f$, in m, of primary members is to be determined by the formulae:

\[ a_f = \frac{l}{6}; \quad (1.6.3.3) \]

\[ a_f = 0.5(a_1 + a_2), \] whichever is the smaller

where $a_1, a_2 =$ distance of the considered member from the nearest members of the same direction located on both sides of the considered member, in m.

1.6.3.4 The width of the effective flange of deep members $c_f$, in m, is determined by the formula

\[ c_f = kc \quad (1.6.3.4) \]

where $c = 0.5(c_1 + c_2)$;

$c_1, c_2 =$ distance of the considered deep member from the nearest deep members of the same direction located on both sides of the considered member, in m;

$k =$ factor obtained from Table 1.6.3.4 depending on $c$, given span $l_p$, and number $n$ of members supported by considered deep members.

**Table 1.6.3.4**

<table>
<thead>
<tr>
<th>Number of members $n$</th>
<th>$k$ values at $l_p/c$ equal to:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>$\geq 6$</td>
<td>0.38</td>
</tr>
<tr>
<td>$&lt; 3$</td>
<td>0.21</td>
</tr>
</tbody>
</table>

Note. For intermediate values of $l_p/c$ and $n$, the factor $k$ is determined by linear interpolation.

For simply supported deep members the given span $l_p = l$, and for fixed deep members $l_p = 0.6l$.

The way in which the framing members are to be supported (simple supporting or fixing) is determined proceeding from the general engineering principles with regard for the actual structure (presence of brackets, welding of webs, face plates, etc.) and is characterized by the presence or absence of bending moment effects in the span point of the member.

1.6.3.5 The width of the hatch coaming effective flange is to be equal to one-twelfth of their span but not more than half the distance between the cargo hatch and the ship’s side for the side coaming and, accordingly, half the distance between a cargo hatch and a transverse bulkhead (or the beam nearest to the cargo hatch) for the hatch end coaming.

1.6.3.6 The width of the effective flange of deep members located normal to the direction of corrugations is to be taken equal to 15$s$ and 20$s$ for trapezoidal and wave-shaped corrugations respectively ($s =$ thickness of corrugated plates, in mm) or 0,1$c$ (for $c$, see 1.6.3.4), in mm, whichever is less.

1.6.3.7 Where primary members parallel to deep members are fitted over the width of the effective flange of the latter, full cross-sectional areas of the above primary members shall be adopted for calculation when determining the inertia moment and section modulus of the deep members.

1.6.3.8 In case the area of the effective flange is less than that of the face plate, the determination of section modulus and moment of inertia of the deep members is subject to special consideration by the Register. This requirement applies to deep members of corrugated structures.

1.6.4 Scantlings of structural members.

1.6.4.1 The section modulus $W$, in cm$^3$, of primary members of rolled section is not to be less than:

\[ W = W^*\omega_c \]

where $W^* =$ section modulus of member considered, in cm$^3$, determined from 1.6.4.2;

$\omega_c =$ multiplier taking into account corrosion allowance, determined in accordance with 1.1.5.3;

The section modulus of built-up welded members is to satisfy the requirements of 1.6.4.2. In this case the thickness of section elements is to be increased by corrosion allowance $\Delta s$.

1.6.4.2 The section modulus of member considered, in cm$^3$, without taking into account corrosion allowance is determined by the formula

\[ W^* = \frac{Ql^3}{m \cdot k_s \cdot \sigma_n} \quad (1.6.4.2) \]

where $Q = p a l =$ transverse load on member considered, in kN;

$m, k_s =$ factors of bending moment and permissible stresses to be found in the relevant chapters of the present Part of the Rules.

1.6.4.3 The net sectional area (excluding openings) $f_n$, in cm$^2$, of primary and deep member webs is not to be less than:

for members of rolled section,

\[ f_n = f'_{w}\omega_c \quad (1.6.4.3-1) \]

where $f'_{w} = \frac{10N_{max}}{k_s\sigma_n} \quad (1.6.4.3-2)$

$N_{max}, k_s =$ maximum shear force value and permissible shear stress factor as defined in the relevant chapters of the Rules; for $\omega_c$, see 1.1.5.3;

for built-up welded members, the required web cross-sectional area is to be determined by Formula (1.6.4.3-2) with a subsequent increase in thickness by the value of $\Delta s$.

1.6.4.4 The thickness $s$, in mm, of the plates under transverse loading is not to be less than:

\[ s = \text{mak} \left( \frac{P}{k_s \sigma_n} + \Delta s \right) \quad (1.6.4.4) \]

where $m, k_s =$ bending moment and permissible stress factors as defined in the relevant chapters of the Rules;

$k = 1.2 - 0.5a/b$, but not greater than 1;

$a$ and $b =$ smaller and greater sizes, in m, of supporting contour sides of plate structure.
1.6.4.5 The scantlings of the corrugated structures are to comply with the following requirements:

1. The thickness of the trapezoidal corrugations is to be determined by Formula (1.6.4.4) taking \( a \) equal to \( b \) or \( c \), whichever is the greater (Fig. 1.6.4.5).

![Diagram of trapezoidal and wave-shaped corrugations](image)

The following relationship is to be satisfied:

\[
\frac{b}{s} \leq 0.06\sqrt{\eta} \tag{1.6.4.5.1}
\]

where \( b \) = width of the panel parallel to the bulkhead plane, in m (see Fig. 1.6.4.5).

Angle \( \varphi \) (see Fig. 1.6.4.5 a) is to be assumed not less than 40°.

2. The thickness of the wave-shaped corrugations, \( s \), in mm, is not to be less than:

\[
s = 22\beta_0 R \sqrt{\frac{p}{k_\alpha \sigma_n}} + \Delta s \tag{1.6.4.5.2-1}
\]

where \( \beta_0 \) = half-angle of spread of corrugation (see Fig. 1.6.4.5, b) in rad.;
\( R \) = radius of corrugation, in m;
\( k_\alpha \) = factor of permissible stresses determined in the relevant chapters of the present Part of the Rules.

In this case, the following relationship is to be satisfied:

\[
R/s \leq 17/R_{eh} \tag{1.6.4.5.2-2}
\]

3. The section modulus of the corrugation is determined according to 1.6.4.1 and 1.6.4.2 taking \( Q = pd\beta_l \) (for \( d_0 \), see Fig. 1.6.4.5).

The spacing and section modulus of corrugations can be determined by the formulae given in Table 1.6.4.5. (Linear dimensions are expressed in cm, \( \varphi \) and \( \beta_0 \) = in deg.).

Factor \( \gamma \) is obtained from the formula

\[
\gamma = 2\beta_0 + 2\beta_0 \cos^2 \beta_0 - 1.5 \sin 2\beta_0 \sqrt{1 - \cos \beta_0} \tag{1.6.4.5.3}
\]

**Table 1.6.4.5**

<table>
<thead>
<tr>
<th>Type of corrugation</th>
<th>Spacing of corrugations</th>
<th>Section modulus</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trapezoidal</td>
<td>( d_0 = 2(b + c \cos \varphi) )</td>
<td>( W = k_B(b + c) )</td>
</tr>
<tr>
<td>Wave-shaped</td>
<td>( d_0 = 4R \sin \beta_0 )</td>
<td>( W = \gamma R^2 )</td>
</tr>
</tbody>
</table>

In calculating the factor \( \gamma \), the angle \( \beta_0 \) is to be taken in radians.

1.6.4.6 Permissible stress factors \( k_\alpha \) and \( k_\tau \) defined in the relevant chapters of the Rules may be increased by 5 per cent for ships of restricted areas of navigation II and II CII and by 10 per cent for III CII and III, 60 m and greater in length, restricted areas of navigation II CII, III CII and III, 60 m and greater in length subject to compressive stresses due to longitudinal bending of the hull girder.

Effective compressive stresses \( \sigma_e \), in MPa, are to be calculated by the following formula:

\[
\sigma_e = \frac{M_T}{s_e} \cdot \gamma \cdot 10^3 \geq 30/\eta
\]

where \( M_T \) = design bending moment, in kN-m, at the section under consideration equal to the maximum absolute value of algebraic sum of the moment components.

\( M_T = M_{sw} + M_{sw} \) for longitudinal members arranged below the neutral axis;
\( M_T = M_{sw} + M_{sw} + M_{pl} \) for longitudinal members arranged above the neutral axis;
\( M_{sw} \) = as defined in 1.4.3, in kN.m;
\( M_{sw} \) = as determined from 1.4.4;
for \( M_{pl} \), see 1.4.5.

The maximum hogging bending moment is to be assumed as design value \( M_T \) for longitudinal members arranged below the neutral axis, and the maximum sagging bending moment — for longitudinal members arranged above the neutral axis.

The buckling strength of side shell and longitudinal bulkheads at the section considered is to be ensured under shear stresses \( \tau_e \), in MPa, calculated by the following formulae:

for side shell plating in ships without effective longitudinal bulkheads

\[
\tau_e = \frac{N_{sw} + N_{sw}}{2s} \frac{S}{T} \cdot 10^2;
\]

for side shell plating in ships with two effective longitudinal bulkheads

\[
\tau_e = \frac{N_{sw} + N_{sw}}{s_s} \frac{S}{T} \cdot \alpha_s \cdot 10^3;
\]
for longitudinal bulkhead plating in ships with two effective longitudinal bulkheads

\[ \tau_s = \frac{N_{sw} + N_w}{S} \frac{s}{I} \cdot 10^2 \]

where \( N_{sw} \) = still water wave force at the section considered, defined in 1.4.3, in kN;
\( N_w \) = wave vertical shear force determined from 1.4.4.2;
\( s \) = actual thickness of side shell plating in ships without longitudinal bulkheads, in mm;
\( s_r, s_l \) = actual thicknesses of side shell plating and longitudinal bulkhead plating at the section considered in ships with two longitudinal bulkheads, in mm;
\( S, I \) = as defined in 1.4.2;
for \( s_r, s_l \), see 1.4.7.2.

Where one or more than two continuous longitudinal plane bulkheads or longitudinal bulkheads with horizontal corrugations are fitted, the shear stresses are determined by a procedure approved by the Register.

### 1.6.5.2 The buckling strength of longitudinal members is considered sufficient if the following conditions are met:

\[ k \sigma_s \leq \sigma_{cr} \]
\[ \tau_s \leq \tau_{cr} \]

where \( k = 1 \) for plating and for web plating of stiffeners;
\( k = 1.1 \) for stiffeners;
for \( \sigma_s, \tau_s \), see 1.6.5.1;
for \( \sigma_{cr}, \tau_{cr} \), see 1.6.5.3.

For plate panels, the factor \( k \) may be reduced in respect of ships of restricted navigation areas: \( 1 \) — by 10 per cent, \( 2 \) and \( 3 \) for \( 15 \) per cent, \( 3 \) and \( 4 \) for \( 20 \) per cent. In this case, when determining the actual section modulus of hull in accordance with 1.4.8, the strength reduction of compressed plates should be considered, i.e. the plates of reduced buckling strength should be included in the hull girder cross section with the reduction factor \( \psi \) determined by the formula

\[ \psi = 0.5(1 + \sigma_{cr}/\sigma_s) \leq 1 \]

### 1.6.5.3 Critical stresses \( \sigma_{cr} \) and \( \tau_{cr} \), in MPa, are to be determined by the formulae:

\[ \sigma_{cr} = \sigma_s \text{ when } \sigma_s \leq 0.5 R_{sh}; \]
\[ \sigma_{cr} = R_{sh}(1 - R_{sh}/4\sigma_s) \text{ when } \sigma_s > 0.5 R_{sh}; \]
\[ \tau_{cr} = \tau_s \text{ when } \tau_s \leq 0.29 R_{sh}; \]
\[ \tau_{cr} = R_{sh}(0.58 - 0.08 R_{sh}/\tau_s) \text{ when } \tau_s > 0.29 R_{sh} \]

where \( \sigma_s, \tau_s \) = Euler normal and shear stresses to be determined in accordance with 1.6.5.4 and 1.6.5.5.

### 1.6.5.4 When checking the buckling strength, the Euler stresses \( \sigma_s \), in MPa, for primary and deep longitudinal members are to be determined by the following formulae:

1. for column buckling of primary longitudinal members without rotation of the cross section

\[ \sigma_s = 206i/lf^2 \]

\[ (1.6.5.4-1) \]

where \( i = \) moment of inertia, in \( \text{cm}^4 \), of longitudinal, including plate flange and calculated with thickness reduced by the value of \( As \) (for \( As \), see Table 1.6.5.5-2);
\( f = \) cross-sectional area, in \( \text{cm}^2 \), of longitudinal, including plate flange and calculated with a thickness reduced by the value of \( As \) (for \( As \), see Table 1.6.5.5-2); a plate flange equal to the flange spacing may be included;

2. for torsional buckling of primary longitudinal members

\[ \sigma_s = (203/2)(i_{u}/i_{p})(m^2 + k/m^2) + 79310i_{u}/i_{p} \]

\[ (1.6.5.4-2) \]

where \( k = 0.05s_t^2/i_{p}; \)
\( m = \) number of half waves, given by Table 1.6.5.4.

<table>

</table>

\( \sigma_s \) = moment of inertia, in \( \text{cm}^4 \), of profile under simple torsion (without plate flange), determined as follows:

\[ i_s = \frac{h_s}{3} \cdot 10^{-4} \text{ for flat bars; } \]
\[ i_s = \frac{h_s}{3} \left[ h_s \cdot s_b + 0.63 \sqrt{h_s / b_t} \right] \cdot 10^{-4} \text{ for angles, bulb, symmetrical bulb and "Tee" profiles; } \]
\[ i_p = \text{pol} \text{ar} \text{ moment} \text{ of} \text{ inertia, in} \text{ cm}^4, \text{ of profile about connection of stiffener to plate, determined as follows: } \]
\[ i_p = \frac{h_p}{3} \cdot 10^{-4} \text{ for flat bars; } \]
\[ i_p = \frac{(h_p^2 + 2h_p h_s + 4h_s^2)}{2} \cdot 10^{-6} \text{ for "Tee" and symmetrical bulb profiles; } \]
\[ i_p = \frac{(h_p^2 + 2h_p h_s + 4h_s^2)}{2} \cdot 10^{-6} \text{ for angles and bulb profiles; } \]
\( h_s = \) web height, in mm;
\( s_t = \) web thickness, in mm, reduced by the value of \( As \) (for \( As \), see Table 1.6.5.5-2);
\( b_t = \) flange width, in mm, and angles and "Tee" profiles or bulb width, in mm, for bulb and symmetrical bulb profiles;
\( s_t = \) flange thickness or bulb thickness, in mm, reduced by the value of \( As \) (for \( As \), see Table 1.6.5.5-2). For bulb and symmetrical bulb profiles, \( s_t \) may be adopted equal to the mean thickness of the bulb;
\( c = \) spring stiffness exerted by supporting plate panel, determined by the formula

\[ c = \frac{68,7 k_s h_s^3}{i_s} \]

\[ (1 + \frac{3.3 k_s h_s^3}{i_s} \cdot 10^{-4}) \]

\( k_s = \frac{1 - \sigma_s/\sigma_{cr} > 0}{(0.01 \text{ for angles, bulb, symmetrical bulb and "Tee" profiles; }) \}
\( c = \) compressive stress according to 1.6.5.1;
\( \sigma_s = \) Euler stress of supporting plate according to 1.6.5.5;
\( s_t = \) supporting plate thickness, in mm, reduced by the value of \( As \) (for \( As \), see Table 1.6.5.5-2);
\( a = \) distance between longitudinal;
### Table 1.6.5.5-1

</tbody>
</table>

**Notes:**
1. \( \psi \) = ratio between smallest and largest compressive stress when linear variation across panel;
2. \( \varepsilon = 1.3 \) when plating is stiffened by floors or deep girders;
3. \( \varepsilon = 1.21 \) when stiffeners are angles, symmetrical bulbs or T-sections;
4. \( \varepsilon = 1.1 \) when stiffeners are bulb flats;
5. \( \varepsilon = 1.05 \) when stiffeners are flat bars.

#### 1.6.5.5 Euler normal \( \sigma_n \) and shear \( \tau_s \) stresses, in MPa, for plate structures are to be determined as for rectangular plates by the formulae:

\[
\sigma_n = 0.1854n(s'/b)^2;
\]

\[
\tau_s = 0.1854n(s'/b)^2
\]

where \( n \) = factor depending on the load type of the plate and the ratio of sides (Table 1.6.5.5-1);

\( s' \) = actual thickness of the plate reduced by the value of \( As \) obtained from Table 1.6.5.5-2;

\( b \) = plate side located normal to the direction of normal compressive stresses; when the plate is exposed to shear stresses, \( b \) is the smaller side of the plate, in m.

### Table 1.6.5.5-2

**Note.** \( As = 0 \) otherwise.
1.6.5.6 The moment of inertia \( i \), in \( \text{cm}^4 \), of the stiffeners on deep girder webs (see 1.7.3.2) is not to be less than determined by the formulae:

for the stiffeners fitted normal to the girder face plate

\[
i = \gamma as^3 \cdot 10^{-3};
\]

(1.6.5.6-1)

for the stiffeners parallel to the girder face plate

\[
i = 2.35\left(\frac{f + 10as}{\eta}\right)^2.
\]

(1.6.5.6-2)

where \( \gamma \) = coefficient obtained from Table 1.6.5.6 depending on the ratio of the girder web depth \( h \) to the spacing of stiffeners \( a \); \( a \) = spacing of stiffeners, in cm; \( s \) = actual thickness of the web, in mm; \( f \) = actual cross-sectional area of the stiffener, in \( \text{cm}^2 \); \( l \) = span of the stiffener, in m. \( \eta \) = as determined according to 1.1.4.3

Note. The intermediate values of \( \gamma \) are determined by linear interpolation.

1.6.6 Aluminium alloy structures.

1.6.6.1 The scantlings of aluminium alloy structures are to be determined by conversion of the scantlings relating to the corresponding steel structures. The conversion is to be made using the formulae of Table 1.6.6.1 without considering the limits by minimum scantlings of steel structures.

<table>

</tr>
</tbody>
</table>

Notes: 1. \( R_{p,sh} \) — proof stress of aluminium alloy, in MPa. 2. The values of \( s, W, f, I \) as stipulated by the Rules may be adopted without corrosion allowance.

1.6.6.2 The sectional area of sternframe, stem, bar keel and propeller shaft brackets is to be 1.3 times that required for steel application.

1.6.6.3 Where continuous welds (fillets, butt welds) are located in most stressed positions, account is to be taken of the reduction in strength at the welded joint location depending on the given aluminium alloy and the process of welding. 1.6.6.4 On agreement with the Register, the bimetallic (steel — aluminium) pressed elements for connection of steel and aluminium alloy structures may be used.

1.7 WELDED STRUCTURES AND JOINTS

1.7.1 General.

1.7.1.1 Any change in the shape or section of the members of welded hull structure is to take place gradually. All openings are to have rounded corners and smooth edges.

1.7.1.2 The scantlings of sections and the thicknesses of plates used for longitudinal members are to change gradually throughout the ship’s length.

Any change of framing system and plating thicknesses used for the strength deck, bottom, side shell and longitudinal bulkheads shall not be permitted in areas where mechanical properties of steel change.

1.7.1.3 Continuity is to be ensured for as many of main longitudinal members as possible, and a gradual change of their sections is required in way of the ends together with other arrangements, contributing to the reduction of stress concentration.

1.7.1.4 In tight structures, as well as in non-tight structures subject to intense vibration, stiffeners and similar details are to be fitted to prevent hard spots in the plating at the toes of brackets and in way of face plates of the members passing through, or terminating at the above-mentioned structures.

1.7.1.5 The length of unsupported plating between the end of a longitudinal and the nearest web normal to direction member is to be as short as possible, however, not more than 4s or 60 mm, whichever is less (s = plate thickness, in mm).

1.7.1.6 For the purpose of this Part of the Rules, the hull structures subject to intense vibration are those situated in way of machinery and equipment which constitute a source of vibration.

Considered as regions with high level of vibration in all ships are the regions situated below the lower platform continuous within the machinery space and bounded:

- at aft end, by a section forward of the edge of propeller boss at twice the propeller diameter, but not less than to the after peak bulkhead;
- in the machinery space, by the bulkheads of this space.

The bulkheads forming boundaries of machinery space, the after peak bulkhead and the lower continuous platform in the above regions throughout the length of the ship are considered to be structures subject to intense vibration.
1.7.1.7 In way of the ends of bulwark, bilge keels, and other details welded to the hull, as well as generally of gutterway bars, their height is to decrease on a length of at least 1.5 times the height of these members. The ends of bulwarks are to be tapered. This is also recommended for the portions of the ends of the gutter bars.

1.7.1.8 Welded joints, welding consumables and procedures, testing and inspection methods of welded joints are to comply with requirements of Part XIV "Welding".

1.7.2 Connections of framing members.

1.7.2.1 In general, the framing members are to have butt-welded joints. Overlapping joints may be allowed on agreement with the Register, except in regions with high level of vibration, deep member connections and in way of heavy concentrated loads.

In general, brackets are to be made of steel having the same yield stress as the steel of the members connected.

1.7.2.2 Connections of primary members.

1. Unless otherwise provided, the size of brackets $c$, in cm, measured in accordance with Fig.1.7.2.2.1 is to be determined by the formula

$$c = 5\sqrt{W/s} \quad \text{(1.7.2.2.1)}$$

where $W$ = Rule section modulus of the member attached, in cm$^3$;

$s$ = thickness of bracket, in mm.

The thickness of bracket is taken equal to that of the member web. Where the web thickness is more than 7 mm the bracket thickness may be reduced by 1 mm; where the web thickness is more than 12 mm, the bracket thickness may be reduced by 2 mm.

Where a bracket connects two members of different profile, the characteristics of the smaller profile are to be used for determining the bracket size.

The bracket height $h$ (see Fig. 1.7.2.2.1) is to be not less than 0.7 times the required size $c$.

![Fig. 1.7.2.2.1](image1.png)

The size of brackets determined as indicated above, refers to the case when the members to be interconnected are not welded to each other or the member butts are not welded to the plating. The allowable gap is not to exceed 40 mm or 25 % of size $c$, whichever is less. Otherwise, $c$ may be required to be increased.

2. If the free edge $l$, in mm, of a bracket (see Fig.1.7.2.2.1) is longer than $45s$ ($s$ = thickness of the bracket, in mm), the bracket is to have a flange (face plate). The width of the flange is to be not less than 50 mm, the width of the face plate, not less than 75 mm. The thickness of the face plate is not to be less than that of the bracket. The width of the flange (face plate) is to be in accordance with the require-ments of 1.7.3.1.

3. The size of brackets may be reduced:

by 10 per cent, where the framing members are welded to each other or to the plating;

by 15 per cent, where a face plate or flange is provided;

by 25 per cent, where the framing members are welded to each other and the brackets are provided with a face plate or flange.

4. In regions with high level of vibration the butt ends of framing members are to be generally connected, with the minimum dimensions of the plating portions unsupported by the framing (Fig. 1.7.2.2.4).

![Fig. 1.7.2.2.4](image2.png)

5. Where there is a gap between the butt of beam and the frame in way of side strengthening of ships mooring at sea, in region I of ice strengthening in categories J9, J8, J7, J6, J5 ships and in region A1 of category J3 ships, the beam bracket is to have a face plate or flange.

1.7.2.3 Deep members are recommended to be connected by rounded brackets with smooth change of web depth and face plate size.

1. The height and width of brackets interconnecting the members, or attaching them to bulkheads are, unless provided otherwise, to be not less than the members web depth (or the lesser web depth of the members connected). The bracket thickness is assumed equal to the lesser of the member web thicknesses. In member connections no gaps are permissible.

2. The brackets connecting the members are to have a face plate or flange along the free edge. In places of transition from the face plates of brackets to those of members, the width and thickness of the face plate along the free edge at different sizes of the member face plates are to change smoothly. The area of face plate (or flange) of tripping bracket is to be
taken not less than 0.8 times the area of lesser face plate of the members connected.

If the distance, in mm, between bracket ends exceeds $160s_{\sqrt{h}}$ ($s =$ thickness of bracket, in mm), a stiffener is to be fitted parallel to the line connecting bracket ends at the distance $a$ equal to $\frac{1}{4}$ of the bracket height or 35 times its thickness (whichever is less). The inertia moment of the stiffener is to be determined by Formula (1.6.5.6-2).

Brackets are to be additionally stiffened depending on their size and configuration (see 1.7.3.2.2).

3 The radius of rounding is not to be less than the depth of the smaller members connected.

The webs and face plates are to be supported by stiffeners and tripping brackets in way of rounding (Fig. 1.7.2.3).

**Fig. 1.7.2.3**

1.7.2.4 The constructions used for the attachment of primary members to supporting members are to comply with existing standards.

1.7.3 **Construction of deep members.**

1.7.3.1 The depth $h$ and thickness $s_{w}$ of member webs (as well as of built-up primary members) and their sectional area are regulated by the relevant chapters of this Part of the Rules. The width of member face plate $b$, in mm, as measured from its web, is not to be more than:

$$b = 200s_{f,p} \sqrt{R_{eH}}$$

where $s_{f,p}$ = thickness of member face plate, in mm.

The thickness of face plate is not normally to exceed a triple thickness of the web plate.

1.7.3.2 Where $h/s_{w} > 60\sqrt{h}$ (for $h$ and $s_{w}$, in mm, see 1.7.3.1), the webs of members (except for those whose buckling strength is to be checked in accordance with 1.6.5) should be stiffened by tripping brackets and stiffeners (Fig. 1.7.3.2).

1 Where $h/s_{w} \geq 160\sqrt{h}$, the webs of members are to be stiffened with the stiffeners fitted parallel to the member face plate (see Fig. 1.7.3.2a). Where $h/s_{w} < 160\sqrt{h}$, stiffening may be carried out as shown in Fig. 1.7.3.2 b,c.

The spacing of stiffeners (width of non-stiffened web area), in mm, is not to be greater than $a = 90s_{w}/\sqrt{h}$.

On agreement with the Register, the structure shown in Fig.1.7.3.2d may be permitted.

**Fig. 1.7.3.2**

In way of portions equal to 0.2, but not less than 1.5 from supports ($l$ and $h$ are the span and depth of member web respectively), the spacing $a$ is to be reduced 1.5 times.

Stiffeners fitted normal to the face plate of the member supporting primary members (e.g. longi-tudinals, bulkhead stiffeners, frames, etc.) are to be fitted not further than in line with every second member in question.

Variation from the above spacing of stiffeners may be allowed on the basis of the results of direct strength calculation.

2 The thickness of stiffener is not to be less than $0.8s_{w}$. Moment of inertia of the stiffeners is determined according to 1.6.5.6.

3 The tripping brackets stiffening deep members are to be fitted at the toes of brackets securing the members in way of roundings and struts as well as in way of span of the member (see Fig. 1.7.3.2 $a$ and $b$). In any case, the spacing of brackets is not to exceed $3.0 \text{ m or } 15h_{f,p}$ ($h_{f,p}$ = full width of face plate, in mm), whichever is less.

The thickness of the tripping brackets is to be not less than required for the member web. The brackets are to be extended to the member face plate and be welded to it if the width of the face plate exceeds 150 mm, as measured from the member web to the free edge of face plate. The width of the bracket section being welded should be at least 10 mm smaller than the face plate width.

Where the width of face plates symmetric to the member web exceeds 200 mm, small brackets are to be fitted at the opposite side of the web in line with the tripping bracket. The width of the tripping brackets, measured at the base is not to be less than half their depth.
The bracket is to have a face plate or flange if the length of free edge / $> 60$s (s = thickness of bracket, in mm). The width of the face plate or flange is not to be less than /s/.

1.7.3.3 Lightening holes, cut-outs for the passage of framing members, etc. are permitted in the member webs.

The total depth of openings in the same section is not to exceed 0.5 of the member depth. For deck transverses, deck girders, webs and girders of watertight bulkheads in dry cargo ships, this value may be increased to 0.6 of the member depth.

The distance from the edges of all openings in deep members to the edges of cut-outs for the passage of primary members is not to be less than the depth of these members. The openings in deep member webs, except for cut-outs for the passage of primary members, are to be located at a distance not less than half the deep member depth from the toes of brackets attaching this member. Where it is impossible to satisfy this requirement, compensation is to be provided by local thickening of the web, fitting of collars, etc.

In all cases, the sectional area of a deep member (excluding openings) is not to be less than required in the relevant chapters of this Part of the Rules.

For requirements regarding openings in floors, side girders and centre girder, see 2.4.2.7.

1.7.4 Details of welded structures.

1.7.4.1 The face plates and/or webs are to be snipped at the member ends depending on the construction used for attachment of members.

1.7.4.2 The width of flange (face plate) of brackets is not to be less than 8 bracket thicknesses unless expressly provided otherwise in the relevant chapters of this Part of the Rules.

1.7.4.3 The edges of brackets, face plates and webs of the members shall be welded all round and shall have no craters. This requirement also applies to air and drain holes and cut-outs for the passage of framing members and welded joints.

Where these openings are carried to the deck or bottom shell plating, their length as measured at the plating, is to comply with the requirements of 1.7.5.8.

1.7.4.4 Welded joints are to be arranged in least stressed structural sections, as far as practicable from abrupt changes of sections, openings and details which were subject to cold forming.

1.7.4.5 The butt joints of face plates of the intersection girders under variable dynamic loads (e.g., in regions with high level of vibration) are to be made with smooth transition by means of diamond plates.

1.7.4.6 It is recommended that local concentration of welds, crossings of welds at an acute angle, as well as close locations of parallel butts or fillet welds and butt welds, be avoided. The distance between parallel welded joints, whatever their direction, is not to be less than:

- 200 mm between parallel butt welds;
- 75 mm between parallel fillet and butt welds;
- 50 mm between parallel fillet and butt welds on a length not exceeding 2 m.

On agreement with the Register, the distance between welded joints may be reduced. The angle between two butt welds is not to be less than 60° (Fig. 1.7.4.6).

1.7.5 Types and dimensions of fillet welds.

1.7.5.1 The design throat thickness $a$, in mm, of fillet welds for tee-connections for manual and semi-automatic welding is not to be less than:

$$ a = 2\bar{\beta}s $$

where $x = $weld factor given in Table 1.7.5.1-1. For structures inside cargo tanks of tankers $x$ is to be increased by 0.05;

$\bar{\beta} = $factor given in Table 1.7.5.1-2 depending on the ratio of weld pitch $t$, in mm, to weld length $l$, in mm (Fig. 1.7.5.1-1);

$s = $thickness of the lesser of the parts joined.

The relationship between the leg length of the fillet weld and the height of the isosceles triangle inscribed into the cross section of the weld (Fig. 1.7.5.1-2) is to be assumed as $k = 1,4a$ or $a = 0,7k$.

When automatic welding is employed instead of the proposed manual welding, the weld throat or leg

</tbody>
</table>

The throat thickness \( a \) of a fillet weld is not to be less than:
- \( 2.5 \) mm for \( s \leq 4 \) mm;
- \( 3.0 \) mm for \( 4 < s \leq 10 \) mm;
- \( 3.5 \) mm for \( 10 < s \leq 15 \) mm;
- \( 0.25s \) for \( s > 15 \) mm.

The dimensions of fillet welds taken from calculations are not to exceed the following values:
- \( a \leq 0.7s \) (\( k \leq s \)).

1.7.5.2 Overlapping connections, if allowed (see 1.7.2.1), are to be welded all round by continuous weld with factor 0.4.

The length of overlap, in mm, is to be not less than \( b = 2s + 25 \), but not more than 50 mm (\( s \) = thickness of the thinner of the plates joined).

1.7.5.3 The primary members (beams, deck longitudinals, frames, bulkhead stiffeners, etc.) are to be connected to supporting members (deck girders, deck transverses, side stringers, horizontal girders, etc.) by welds with factor 0.35.

length, whichever is adopted in calculation, may be reduced in height for single-run welds by not more than 30 per cent.

For multi-run welds the percentage of the above reduction is subject to special consideration by the Register.

If the thickness of the thinner of the items to be joined is less than half the thickness of the thicker item, then the leg lengths are subject to special consideration by the Register.
The sectional area \( f \), in \( \text{cm}^2 \), of the welds connecting the primary members to supporting members is not to be less than determined by the formula

\[
f = 25p a l \sigma_n \tag{1.7.5.3}
\]

where \( p \) = pressure, in kPa, specified in appropriate chapters of this Part of the Rules;

\( a \) = spacing of members, in m;

\( l \) = span of member, in m;

for \( \sigma_n \) see 1.1.4.3.

The weld sectional area \( f \) is determined by summing up the results obtained by multiplying the throat thickness by the weld length of each portion of the connection of member web to supporting member.

1.7.5.4 The framing members cut at intersection with other structures are to be in good alignment. A non-alignment is not to exceed half the thickness of the member. Where continuity is obtained by directing welding of the members to the structure involved, the throat thickness of the weld is to be determined considering the thickness of the member concerned. Otherwise, through penetration welding is to be performed. If the thickness of the thinner of the parts joined is less than 0.7 of the thickness of the other part, the throat thickness is to be calculated with regard to the particular loading conditions in way of the intersection.

Where longitudinals are cut at transverse bulkheads, the construction used for their attachment is to comply with the following requirements:

.1 When the brackets are fitted in line on both sides of the bulkhead, the area \( f_1 \), in \( \text{cm}^2 \), of the weld connecting the brackets (and the longitudinal butt ends, if they are welded) to transverse bulkheads (Fig. 1.7.5.4 a) is not to be less than determined by the formula

\[
f_1 = 1.75S_0
\]

where \( S_0 \) = cross-sectional area of the longitudinal (effective flange excluded), in \( \text{cm}^2 \).
.2 If one continuous bracket plate welded in the appropriate slot cut in the bulkhead plating is fitted (Fig. 1.7.5.4 b), the sectional area of the bracket at the bulkhead is not to be less than 1.25 S₀.

.3 The arm length Iₜₚ of the bracket, in mm, over the longitudinals is not to be less than determined by the formula

\[ I_{tp} = \frac{1.75 S_0 - S_1}{2a} \times 10^2 \]

where \( S_1 \) = area of weld connecting longitudinal butt ends to transverse bulkheads, in cm²;
\( a \) = accepted design thickness of fillet weld connecting bracket to longitudinal, in mm.

1.7.5.5 Where plate thickness exceeds 18 mm, for connections made by fillet welds in which excessive stress in Z-direction may be caused by welding process or by external loads, Z-steel (see 12.2.2.2) is to be used or structural measures are to be taken to prevent lamellar tearing. In all cases, reducing of residual stress level is to be provided.

1.7.5.6 Double continuous welds are to be used in the following regions (see also Note 1 to Table 1.7.5.1-1):

.1 within 0.25L from the forward perpendicular in ships with length \( L \geq 30 \) m, for connection of framing members to bottom shell, and in case of only a single bottom in this region, also for welding of the webs of centre girder, side girders and floors to face plates of these members;

.2 in region I of ice strengthening in ships of categories \( \text{LIV}_9, \text{LIV}_8, \text{LIV}_7, \text{LIV}_6, \text{LIV}_5, \text{LIV}_4 \) and in region A1 of category \( \text{LIV}_3 \) ships, for connection of side framing to shell plating;

.3 in way of foundations for machinery and equipment which may constitute a source of vibration (see 1.7.1.6), for connection of framing members to bottom and inner bottom platings, deck framing to deck plating;

.4 for the structures in the after peak;

.5 in way of supports and member ends, for connection of framing members to the plating (see 1.7.5.8);

.6 in tanks (including double bottom tanks), exclusive the tanks for oil fuel or lubricating oil;

.7 for structures providing tightness.

1.7.5.7 Single continuous welds are not to be used:

.1 within 0.2L from F.P. for connection of side framing to shell plating, and within 0.25L from F.P. for connection of bottom framing to shell plating;

.2 for structures subject to intense vibration (see 1.7.1.6);

.3 in region I of ice strengthening of ships;

.4 for welding of side framing in ships mooring alongside other ships at sea or offshore units;

.5 for connections where the angle between a member web and the plating differs by more than 10° from a right angle.

1.7.5.8 For all types of intermittent joints the weld length (see Fig. 1.7.5.1-1) is not to be less than 15a (for a, see 1.7.5.1) or 50 mm, whichever is the greater. The spacing of welds \((t - l)\) — for chain welds and scalloped framing, and \((t - 2l)/2\) — for staggered welds) is not to exceed 15s (s = plate thickness or web thickness, whichever is less). In any case, the spacing of welds or callopl length, where scalloped frames are used, is not to exceed 150 mm.

Intermittent or single continuous welds connecting the framing members to the plating are to be substituted in way of supports and member ends by double continuous welds having the same throat thickness as the intermittent or single continuous welds of the remaining part of the members. The length of joints welded from both sides is to be not less than the sum of bracket arm and the web depth, if a bracket is fitted, and is to be twice the web depth if no bracket is fitted. Where the framing members pass through supporting structures (deck transverses, deck girders, floors, etc.), the aforesaid reinforcement is to be provided on both sides of supporting member. Where single continuous welds are used, buck runs at least 50 mm long and spaced not more than 500 mm apart are to be welded on the reverse side of the detail joined. The throat thickness of back weld is to be the same as that of the single continuous weld.

1.7.5.9 Staggered spot welds and single intermittent welds (see Fig. 1.7.5.1-1 d, e) may be used in the structures of deckhouses and superstructures of the second tier and above, on decks inside first tier superstructures, casings, enclosures inside the hull, not subject to intense vibration and impact loads and not affected by active corrosion, provided that the maximum plate or member web thickness is not more than 7 mm.

The spot diameter \( d \), in mm, is not to be less than:

\[ d = 1.12 \sqrt{\pi S_1} \]  

(1.7.5.9)

where \( t \) = pitch of spot weld (see Fig. 1.7.5.1-1);
\( t_{max} = 80 \) mm;
for \( S_1 \) and \( s \), see 1.7.5.1.

If \( d > 12 \) mm, as obtained from Formula (1.7.5.9), the weld pitch is to be increased or another type of weld is to be chosen.

1.7.5.10 Scalloped construction is not to be used:

.1 for side framing within 0.2L from F.P. and for connection of framing members to bottom shell plating within 0.25L from F.P.;

.2 in regions with high level of vibration (see 1.7.1.6);

.3 for side and bottom framing in region I of ice belt and for side framing in ships mooring at sea alongside other ships or offshore units;

.4 for connection of bottom centre girder to plate keel;

.5 for deck and inner bottom framing in locations where containers, trailers and vehicles may be stowed and for upper deck framing under deckhouses in way of their ends at a distance less than 0.25 of the deckhouse height from the intersection of deckhouse side and end bulkhead.
1.7.5.11 In scalloped construction (see Fig. 1.7.5.1) the welding is to be carried round the ends of all lugs. The depth of scallop in member web is not to exceed 0.25 of the member depth or 75 mm, whichever is less. The scallops are to be rounded with radius not less than 25 mm. The spacing of lugs is to be not less than the length of the scallop.

Scallops in frames, beams, stiffeners and similar structures are to be kept clear of the ends of structures, as well as intersections with supporting structures (decks, side stringers, deck girders, etc.) by at least twice the member depth, and from the toes of the brackets by at least half the member depth.

1.7.5.12 In the framing of tanks (including double-bottom tanks and the tanks of tankers), provision should be made for openings to ensure free air flow to air pipes, as well as an overflow of liquid.

It is recommended that openings in longitudinals should be elliptical with a distance from the edge of opening to deck plating or bottom shell plating not less than 20 mm.

In way of air and drain holes, cut-outs for the passage of framing members and welded joints the joints are to be welded as double welds on a length of 50 m on both sides of the opening.

1.7.5.13 Where welding of tee-joints by fillet welds is impracticable, plug welds (Fig. 1.7.5.13 a) or tenon welds (Fig. 1.7.5.13 b) may be used. The length and pitch are to be determined as for scalloped frames under 1.7.5.11.

For plug welding, the slots are to be of circular or linear form, with throat thickness of weld equal to 0.5 of plate thickness. In general, the ends of slots in plug welding are to be made semicircular. The linear slots are to be arranged with longer side in the direction of the parts to be joined (see Fig. 1.7.5.13 b).

Complete filling of slot is not permitted.

In regions of high level of vibration (see 1.7.1.6) welded joints with complete root penetration and permanent backing ring (Fig. 1.7.5.13 c) are recommended instead of tenon welds or plug welds.

1.7.5.14 Where aluminium alloy structures are welded according to Table 1.7.5.1-1, it is not permitted:

.1 to use intermittent welds (except in scalloped construction);

.2 to use scalloped construction in regions of high level of vibration (see 1.7.1.6).

The throat thickness of welds is to be not less than 3 mm, but not more than 0.5s (for s, see 1.7.5.1).

Fig. 1.7.5.13
2 GENERAL REQUIREMENTS FOR HULL STRUCTURES

2.1 GENERAL

2.1.1 Application.

The requirements given in this Section apply to sea-going ships of all types and purposes, having regard to additional provisions of Section 3 "Requirements for Structures of Ships of Special Design".

The Section contains the requirements for hull structures: shell plating, platings, primary and deep members, pillars, stems, sternframes, seatings, etc.

2.1.2 Symbols.

$L_1$ = length of the compartment, in m, measured as follows:

- with plane bulkheads, as the distance between bulkhead platings;
- with corrugated bulkheads, as the distance between corrugation axes or the axes of trapezoidal stools at the inner bottom level;
- with cofferdam bulkheads, as the distance between middle cofferdam axes;

$B_1$ = breadth of the compartment, in m, measured at its mid-length as follows:

- for single skin construction, as the distance between the sides or between the side and the longitudinal bulkhead at the upper edge of the floor;
- for double skin construction, as the distance between inner skins or between the inner skin and the longitudinal bulkhead;

where hopper side tanks are fitted, as the distance between hopper tanks at the inner bottom level or between the longitudinal bulkhead and the hopper side tank;

where several longitudinal bulkheads are fitted, as the spacing of longitudinal bulkheads or as the distance between the longitudinal bulkhead nearest to the side and the appropriate side;

$l$ = span of the member, in m, defined in 1.6.3.1, unless provided otherwise;

$h$ = depth of the member web, in cm;

$a$ = spacing of primary or deep members concerned (longitudinal or transverse framing); where the spacing varies, $a$ is the half-sum of the distances of adjacent members from the member concerned;

$s$ = plate thickness, in mm;

$W$ = section modulus of members, in cm$^3$;

$I$ = moment of inertia of members, in cm$^4$;

$A_s$ = corrosion allowance to the plate thickness, in mm (see 1.1.5.1);

$\alpha_s$ = factor taking account of corrosion allowance to the section modulus of members (see 1.1.5.3).

2.2 SHELL PLATING

2.2.1 General and symbols.

2.2.1.1 Requirements are given in this Chapter for the thickness of bottom and side shell plating, thickness and width of sheerstrake, plate keel, garboard strakes, as well as the requirements for the minimum structural thicknesses of these members and construction of openings therein. The requirements are applicable to all regions over the ship's length and depth unless additional requirements for shell plating thickness are put forward.

2.2.1.2 Symbols.

$p_s$ = design static pressure according to 1.3.2.1;

$p_w$ = design pressure due to the motion of ship hull about wave contour according to 1.3.2.2;

$p_c$ = design pressure from carried liquid cargo, ballast or oil fuel according to 1.3.4.2.1.

2.2.2 Construction.

2.2.2.1 No openings are to be cut in the upper edge of sheerstrake or in the side shell plating if the distance between the upper edge of opening and the strength deck is less than half the opening depth. All other cases are to be specially considered by the Register.

Rectangular openings cut in the side shell plating are to have their corners rounded with the radius equal to 0.1 of the opening depth or width, whichever is less, but not less than 50 mm.

In all cases when the openings may result in considerable reduction of longitudinal or local strength of the ship, provision is to be made for reinforcement of such areas.

Reinforcement by means of thickened insert plates is required for openings located within 0.35$L$ from the midship region, the distance from their upper edge to the strength deck being less than the depth of opening. The minimum width of thickened insert plates, as measured from the upper or lower edge of opening, is to be equal to 0.25 of the depth or length of the opening, whichever is less; the total width measured outside the opening is to be greater than the minimum thickness by at least 0.25 of the depth or length of the opening, whichever is less. The minimum distance from the end of the thickened insert plate to the nearest edge of opening, as measured along the length of the ship should equal at least 0.35 of the depth or length of opening, whichever is less. The corners of the thickened insert plate are to be rounded. The thickness of the thickened insert plate is not to be less than:

$1.5s$ when $s < 20$ mm;
30 mm when \(20 \leq s \leq 24\) mm;
1.25\(s\) when \(s > 24\) mm

where \(s\) = thickness of shell plating in way of the opening.

A thickened insert plate may be fitted around the perimeter of the opening.

2.2.2.2 The area of transition from sheerstrake to deck stringer may be rounded. In this case, the radius of curvature of sheerstrake is not to be less than 15 times the sheerstrake thickness. No openings are permitted in the rounded area.

2.2.3 Loading on shell plating.

The external pressure \(p\), in kPa, on the bottom and side shell plating is determined by the formula

\[
p = p_{st} + p_w
\]

For tankers having no double bottom or double skin side construction, internal pressure \(p = p_w\) is to be determined additionally by Formulae (1.3.4.2.1). If \(p_{st} > p_w\), counterpressure is to be included in the internal pressure calculation

\[
p = p_{st} - (p_{st} - p_w)
\]

As the design pressure, both external and internal pressure may be adopted, whichever is the greater.

The pressure \(p_w\) above the summer load waterline is not to be less than \(p_{min}\), in kPa, determined by the formula

\[
p_{min} = 0.03L + 5
\]

Where \(L > 250\) m, \(L\) is to be taken equal to 250 m.

For ships of restricted area of navigation, the value of \(p_{min}\) may be reduced by multiplying by the factor \(\varphi_r\), obtained from Table 1.3.1.5.

2.2.4 scantlings of plate structures of shell plating.

2.2.4.1 The thickness of bottom and side shell plating is not to be less than determined by Formula (1.6.4.4) taking:

\[
m = 15.8;
\]

for bottom shell plating

\[
k_a = 0.3k_B \leq 0.6\] in the midship region for \(L \geq 65\) m and transverse framing system;

\[
k_a = 0.6\] in the midship region for \(L = 12\) m and transverse framing system.

Where \(12 < L < 65\), \(k_a\) is to be determined by linear interpolation taking \(k_a = 0.45\) for \(L = 65\) m;

\[
k_a = 0.6\] in the midship region for longitudinal framing system;

\[
k_a = 0.7\] at the ends of the ship within 0.1\(L\) from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, \(k_a\) is to be determined by linear interpolation;

for side shell plating in way of \((0.4 - 0.5)D\) from the base line

\[
k_a = 0.6\] in the midship region;

\[
k_a = 0.7\] at the ends of the ship within 0.1\(L\) from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, \(k_a\) is to be determined by linear interpolation.

For region below 0.4\(D\) from the base line, \(k_a\) is determined by linear interpolation between the values of \(k_a\) for bottom shell plating and those for side shell plating in way of \((0.4 - 0.5)D\) from the base line.

For region above 0.5\(D\) from the base line, \(k_a\) is determined by linear interpolation between \(k_a\) for upper deck level and \(k_a\) for side shell plating in way of \((0.4 - 0.5)D\) from the base line.

\[
k_a\] for upper deck level is determined in the same way as \(k_a\) for bottom shell plating, parameter \(k_D\) being substituted for parameter \(k_B\).

\[
k_B = \frac{W_B}{W}; \quad k_D = \frac{W_D}{W}
\]

where \(W\) = Rule hull section modulus amidships in accordance with 1.4.6;

\[
W_B \text{ and } W_D = \text{ actual section moduli for bottom and deck amidships in accordance with 1.4.8.}
\]

2.2.4.2 The buckling strength of bottom plating, strake above bilge, sheerstrake and strake below in the midship region of ships over 65 m in length is to be verified in accordance with 1.6.5.

2.2.4.3 The thickness of bilge strake is to be adopted equal to that of bottom or side shell plating, whichever is the greater.

2.2.4.4 The width of plate keel \(b_k\), in mm, is not to be less than:

\[
b_k = 800 + 5L
\]

in this case, \(b_k\) need not exceed 2000 mm.

The thickness of plate keel is to be 2 mm greater than that of bottom shell plating.

2.2.4.5 The sheerstrake width \(b_s\), in mm, is not to be less than determined by Formula (2.2.4.4) taking \(b_s\) not greater than 2000 mm.

The sheerstrake thickness amidships is not to be more than that of adjoining strakes of side shell or deck plating (stringer plate), whichever is the greater. At ends, the sheerstrake thickness may be equal to that of side shell plating in this region.

2.2.4.6 The shell plates adjoining the sternframe, as well as the plates to which the arms of propeller shaft brackets are attached, are to have a thickness \(s\), in mm, of not less than that given by:

\[
s = 0.1L + 4.4 \text{ for } L < 80 \text{ m};\]

\[
s = 0.055L + 8 \text{ for } L \geq 80 \text{ m}.
\]

Where \(L > 200\) m, \(L\) is to be taken equal to 200 m.
The aforesaid thickness is to be ensured after hot bending, if applied.

2.2.4.7 The thickness of garboard strakes directly adjoining the bar keel is not to be less than that required for the plate keel, and their width is not to be less than half the width required for the plate keel in accordance with 2.2.4.4.

2.2.4.8 In any case, the thickness of shell plating \( s \), in mm, is not to be less than:

\[
s_{\text{min}} = \begin{cases} 
3.1 + 0.12 L & \text{for } L < 30 \text{ m}; \\
(5.5 + 0.04 L) \sqrt{n} & \text{for } L \geq 30 \text{ m} \end{cases} \\
(2.2.4.8)
\]

where for \( n \), see 1.1.4.3.

Where \( L > 300 \text{ m} \), \( L \) is to be taken equal to 300 m.

Where the adopted spacing is less than the standard one (see 1.1.3) for ships of unrestricted area of navigation and limited area of navigation I, a reduction of minimum thickness of shell-plating is permitted in proportion to the ratio of adopted spacing to standard spacing but not more than 10 per cent.

2.2.5 Special requirements.

2.2.5.1 The grade of steel used for the sheerstrake is to be the same as that used for the strength deck. The upper edge of sheerstrake should be smooth, and their corners should be well rounded in the transverse direction.

2.2.5.2 For ships of 65 m and above, within 0.6L amidships no parts should be welded to the upper edge of sheerstrake or to the sheerstrake rounding.

2.2.5.3 Bilge keels are to be attached to the shell plating by means of an intermediate member, i.e., a flat bar welded to the shell plating with an all-round continuous fillet weld. Connection of the bilge keel to this member should be weaker than that of the member to the shell plating. However, the connection should be strong enough to keep the bilge keels under the ordinary operating conditions of the ship. The intermediate member should be made continuous over the length of bilge keel. Bilge keels are to terminate in the stiffened area of shell plating and are to be gradually tapered at ends.

The bilge keel and the intermediate member are to be of the same steel grade as the shell plating in this region.

2.3 SINGLE BOTTOM

2.3.1 General and symbols.

2.3.1.1 Requirements are given in this Chapter for the bottom framing of ships having no double bottom and in way where it is omitted, as well as for the floors, centre girder, bottom longitudinals and the brackets by which they are connected.

2.3.1.2 Symbols:

\( L_1 \) = length of the compartment concerned (hold, tank, machinery space, etc.), in m;

\( B_1 \) = breadth of the compartment concerned, in m;

\( B_c \) = breadth of ship in m, in way of considered section at the level of summer load waterline.

2.3.2 Construction.

2.3.2.1 In tankers of 80 m and above, longitudinal framing is to be provided for single bottom.

2.3.2.2 The structure of centre girder is to satisfy the following requirements

1. The centre girder is to extend throughout the ship’s length as far as practicable. In ships greater than 65 m in length, a continuous centre girder is recommended between transverse bulkheads.

2. When the bottom is framed longitudinally, the centre girder is to be stiffened on both sides with flanged brackets fitted between the bottom transverses and between bottom transverse and transverse bulkhead. The distance between brackets, between bracket and bottom transverse or between bracket and transverse bulkhead is not to exceed 1.2 m.

The brackets should be carried to the face plate of the centre girder if the web of the latter is stiffened vertically or to the second horizontal stiffener from below if the centre girder web is stiffened horizontally.

In way of bottom plating, the brackets are to extend to the nearest bottom longitudinal and are to be welded thereto.

2.3.2.3 When the bottom is framed transversely, floors are generally to be fitted at every frame.

Where the floors are cut at the centre girder, their face plates are to be butt-welded to the face plate of the centre girder. If the actual section modulus of floors exceeds the value required by 2.3.4.1.2 less than 1.5 times, the width of their face plates is to be doubled, where attached to the centre girder face plate, or horizontal brackets of adequate size are to be fitted.

The floor face plates may be replaced by flanges.

Flanged floors are not permitted in way of machinery space, in the after peak, and in ships of 30 m and above; they are not permitted within 0.25L from the fore perpendicular, either.

2.3.2.4 When the bottom is framed longitudinally, brackets are to be fitted in line with the bottom transverse web on both sides of the centre girder where the girder is higher than the bottom transverse at the place of their connection. A bracket should be welded to bottom transverse face plate and to centre girder web and face plate. The free edge of the bracket should be stiffened with a face plate, and the angle of its inclination to bottom transverse face plate is not to exceed 45°.

Similar requirements apply to the connections of the stringer to bottom transverse where the stringer is
higher than the bottom transverse at the place of connection.

2.3.2.5 When the bottom is framed longitudinally, the spacing of side girders and the distance from the centre girder or ship’s side to the side girder is not to exceed 2.2 m.

The side girder plates are to be cut at floors and welded thereto.

The face plates of side girders are to be welded to those of floors.

2.3.2.6 In tankers, the side girders, if fitted, are to form a ring system together with vertical stiffeners of transverse bulkheads and deck girders.

Deep side girders having the same depth as the centre girder, as well as conventional side girders having the same depth as bottom transverses, are to run continuous from one transverse bulkhead to another with $L_1/B_1 < 1$.

2.3.2.7 In the machinery space, the centre girder may be omitted if the longitudinal girders under engine seating extend from the fore to the after bulkhead of the engine room and terminate with brackets beyond the bulkhead according to 2.3.5.1.

2.3.2.8 In ships having a length of 65 m and more, the buckling strength of centre girder and side girders in the midship region is to be ensured in accordance with 1.6.5.

The webs of centre girder, side girders and floors are to be stiffened in accordance with 1.7.3.

2.3.2.9 Connections of bottom longitudinals to transverse bulkheads should be such that the effective sectional area of the longitudinals is maintained.

2.3.3 Single bottom loading.

2.3.3.1 The design pressure on single bottom structures of dry cargo ships is the external pressure determined by Formula (2.2.3-1) for a ship in the ballast condition. When determining $P_{st}$ in Formula (2.2.3-1), the ballast draught may be taken as 0.6 of the summer draught.

If a dry cargo ship is designed to operate in a fully loaded condition with some holds empty the static pressure $P_{st}$ in Formula (2.2.3-1) for these holds is to be determined at summer draught.

2.3.3.2 As the design pressure on single bottom structures of tankers, external pressure determined by Formula (2.2.3-1) at summer draught is adopted, or the total pressure determined by Formula (2.2.3-2), whichever is the greater.

2.3.4 Scantlings of single bottom members.

2.3.4.1 The bottom with transverse framing is to satisfy the following requirements:

.1 The depth of floors at the centreline is not to be less than 0.055$B_1$. In any case, $B_1$ is not to be taken less than 0.6$B_c$. Allowable reduction of floor depth is not to be more than 10 per cent, the required floor section modulus being maintained.

In the machinery space, the height of floor web between longitudinal girders under the seating is not to be less than 0.65 of the required depth at the centreline.

A reduction of floor section modulus by more than 10 per cent as compared to that required by 2.3.4.1.2 is not permitted.

At a distance of $1/8B_c$ from the centreline, the depth of floors is not to be less than 50 per cent of the required depth of the centreline floors.

.2 At the centreline, the section modulus of floors is not to be less than determined according to 1.6.4.1 and 1.6.4.2 taking:

$$m = 13;$$
$$k_a = 0.6;$$
$$l = B_1,$$ not less than 0,6$B_c$;

for $p$, see 2.3.3.1, but it is not to be less than 35 kPa for dry cargo ships and not less than 85 kPa for tankers.

On portions equal to 0,05$B_c$ from ship’s side, the floor web sectional area is not to be less than determined according to 1.6.4.3 taking:

$$N_{max} = 0,4pat;$$
$$k_r = 0.6.$$

When determining $p$ and $l$, the above limitations should be used.

.3 In accordance with 2.3.4.1.2, the section modulus of centre girder is to be at least 1,6 times greater than the section modulus of a floor at the centreline. The depth of centre girder is to be equal to that of a floor at the place of their connection.

.4 The section modulus of a side girder is not to be less than the section modulus of a floor at the centreline in accordance with 2.3.4.1.2. The depth of side girder is to be equal to that of the floor at the place of their connection.

2.3.4.2 If longitudinal system of framing is adopted, the bottom members in way of the cargo tanks in tankers are to satisfy the following requirements:

.1 The section modulus of bottom longitudinals is not to be less than determined in accordance with 1.6.4.1 and 1.6.4.2 taking:

$$p = \text{as defined in 2.3.3.2;}$$

$$l = \text{span, in m, equal to the distance between bottom transverses or between bottom transverse and transverse bulkhead;}$$

$$m = 12;$$
$$k_a = 0,45k_B \leq 0,65 \text{ in the midship region;}$$
$$k_a = 0,65 \text{ at the ends of the ship within } 0,1L \text{ from the fore or after perpendicular.}$$

For regions between the midship region and the above portions of ship’s ends, $k_a$ is to be determined by linear interpolation.

$k_B$ is to be determined by Formula (2.2.4.1).

.2 The section modulus of a bottom transverse is not to be less than determined from 1.6.4.1 and

### 1.6.4.2. Bottom transverse web sectional area, excluding openings, is not to be less than stipulated under 1.6.4.3 taking:

- \(p = \text{as defined in 2.3.3.2;}
- l = B_t;
- k_e = k_t = 0.6;
- for a wing tank
- m = 18;
- \(N_{\text{max}} = 0.35pal;\)
- for a centre tank,
- \(m = m_{b,t};\)
- \(N_{\text{max}} = 0.7n_{b,t}pal;\)

- \(m_{e,g}\) and \(n_{e,g}\) are to be obtained from Table 2.3.4.2.2 depending upon the parameter \(\mu\) and the number of bottom transverses within a tank;
- \(\mu = \frac{ax}{b}L_1\)
- \(\alpha = W_{b,t}/W_{e,g};\)
- \(W_{b,t}\) = bottom transverse section modulus satisfying the present requirements;
- \(W_{e,g}\) = centre girder section modulus satisfying the requirements of 2.3.4.2.3.

The value of the parameter \(\alpha\) is optional, but is not to exceed 0.6; the value of the parameter \(\mu\) is not to exceed 1.5.

Bottom transverse section modulus is not to be less than \(axW_{e,g}\).

### 3 Centre girder section modulus is not to be less than determined from 1.6.4.1 and 1.6.4.2. The sectional area of centre girder web is not to be less than stipulated under 1.6.4.3 taking:

- \(p = \text{as defined in 2.3.3.2;}
- l = L_1;
- m = m_{e,g};
- \(N_{\text{max}} = 0.7n_{e,g}pal;\)

- \(m_{e,g}\) and \(n_{e,g}\) are to be obtained from Table 2.3.4.2.2 depending upon the parameter \(\mu\) and the number of floors within a tank; \(\mu\) is to be determined in accordance with 2.3.4.2.2:

- \(k_e = 0.35k_p \leq 0.6\) in the midship region;
- \(k_e = 0.6\) at the ends of the ship within 0.1L from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, \(k_e\) is to be determined by linear interpolation;

- \(k_e = 0.6;\)
- \(k_p\) is to be determined by Formula (2.2.4.1).

The section modulus of centre girder is not to be less than \(W_{b,t}/x\) where \(W_{b,t}\) is bottom transverse section modulus satisfying the requirements of 2.3.4.2.2; \(x\) should be as stipulated under 2.3.4.2.2.

### 4 In ships of 200 m and above, provision is to be made for side girders midway between longitudinal
2.4 DOUBLE BOTTOM

2.4.1 General.

Requirements are given in this Chapter for double bottom structures including bottom framing up to the top of bulwark. Lower bottom framing and half height girder margin plate with stiffeners in the double bottom space, sea chests and dunnage. Additional requirements for double bottoms are given in 11.6.3 (passenger ships), 11.16.4 (cargo ships) and 3.3 (bulk carriers and oil bulk cargo carriers; 3.11 (double bottom space), 3.11.1 (double bottom structure) and 3.11.2 (double bottom construction).
of the centreline. The duct keel is to be wide enough for the access to all its structures to be ensured. A duct keel of more than 1.9 m in width is subject to special consideration by the Register.

Transverse members with brackets are to be fitted at every frame in way of the bottom and inner bottom plating between the side plates of the duct keel.

If longitudinal system of framing is adopted, brackets are to be fitted at every frame on both sides of the duct keel, similar to those used for the centre girder.

Where the duct keel fitted only over a part of the ship’s length terminates and is transformed into the centre girder, the duct keel and centre girder plates are to overlap over a length of at least one frame spacing and are to terminate in brackets with face plates. In this case, the length of the brackets is not to be less than three spacings if the transition areas lie within 0.6L amidships, and not less than two spacings elsewhere.

2.4.2.4 The design of side girders and margin plate is to satisfy the following requirements:

.1 The spacing of side girders and the distance between a side girder and centre girder or margin plate, as measured at the level of the double bottom plating, is not to exceed 4.2 m for transversely framed double bottom and 5.0 for longitudinally framed double bottom.

.2 If longitudinal framing is adopted in the double bottom, lightened side girders may be fitted on bottom and double bottom instead of longitudinals (for panels with large openings, see 2.4.2.7.2 and 2.4.2.7.4).

.3 Where there are two tunnels symmetrical with regard to the centreline, their design is subject to special consideration by the Register.

.4 In the machinery space, the arrangement of side girders is to be consistent with that of the engine, boiler and thrust block seatings, so that at least one of the longitudinal girders under the seating is fitted in line with the side girder. In this case, an additional side girder is to be provided under the seating in line with the second longitudinal.

Where side girders cannot be arranged under the seatings in line with longitudinal girders, additional side girders are to be fitted under each longitudinal girder.

Additional side girders may be replaced by half height side girders welded to the inner bottom plating and floors only, if approved by the Register.

.5 Inclined margin plate, if fitted, is to extend throughout the double bottom length.

2.4.2.5 The arrangement and design of floors are to satisfy the following requirements:

.1 If transverse framing is adopted in the double bottom, plate floors are to be fitted at every frame:

in engine and boiler rooms;

at the fore end within 0.25L from the fore perpendicular;

in the holds intended for the carriage of heavy cargo and ore, as well as in holds from which cargo is regularly discharged by grabs;

in ships which may happen to be aground due to the ebb-tide in ports.

In other regions, plate floors may be fitted five spacings or 3.6 m apart, whichever is less. In this case, provision is to be made for open floors (bracket or lightened).

Bracket floors consist of bottom and reverse frames connected with brackets at centre girder, side girders and margin plate (Fig. 2.4.2.5.1-1).

![Fig. 2.4.2.5.1-1](image1)

Lightened floors consist of plate panels having large openings of a smooth shape between side girders (Fig. 2.4.2.5.1-2).

![Fig. 2.4.2.5.1-2](image2)

.2 If longitudinal framing is adopted in the double bottom, plate floors are generally to be fitted at a distance not exceeding two spacings from each other:

in engine and boiler rooms;

at the fore end within 0.25L from the fore perpendicular;

in the holds intended for the carriage of heavy cargo and ore, as well as in holds from which cargo is regularly discharged by grabs;
in ships which may happen to be aground due to the ebb-tide in ports.

In other regions, plate floors may be fitted five spacings or 3.6 m apart, whichever is less. Where lightened side girders are fitted in lieu of bottom and double bottom longitudinals (see 2.4.2.4.2), the above spacing may be increased, but not more than twice.

When the ship's side is framed transversely and double bottom is framed longitudinally, brackets are to be fitted at every frame between plate floors to stiffen the margin plate, which are to be carried to the nearest bottom and inner bottom longitudinals or to the nearest additional side girder, and welded thereto (Fig.2.4.2.5.2).

Under the seating of main engine, plate floors are to be fitted at every frame and carried to the nearest side girder outside the main engine seating.

Irrespective of the requirements of 2.4.2.5.1 and 2.4.2.5.2, plate floors are to be fitted:
- under pillars and ends of longitudinal partial bulkheads;
- under bearers and boiler bearer ends;
- under transverse bulkheads and sloping plates of low trapezoidal stools of corrugated bulkheads;
- under bracket toes of deep tank bulkhead stiffeners in transversely framed double bottom;
- under block bearing seatings.

In the above cases, the floors need not be fitted throughout the ship's breadth. Partial floors may be fitted and carried to the side girder nearest to the structure being stiffened.

Arrangement of stiffeners on centre girder and duct keel, side girders and floors is to satisfy the following requirements:

Stiffeners are to be provided where transverse system of framing is adopted and plate floors are more than 900 mm in depth. The spacing of stiffeners is not to exceed 1.5 m. The spacing of stiffeners of lightened floors is not to exceed 2.2 m.

If longitudinal system of framing is adopted, the stiffeners on plate floors are to be fitted in line with bottom and inner bottom longitudinals. The stiffeners are to be carried to the longitudinals and welded thereto.

The stiffeners are to be fitted under the pillars, at bracket toes of end stiffeners of longitudinal partial bulkheads, etc.

.2 Watertight floors are to be fitted with vertical stiffeners spaced not more than 0.9 m apart.

.2.4.2.7 Holes (manholes) are to satisfy the following requirements:

1. An adequate number of holes (manholes) are to be provided in the inner bottom plating, side girders and floors for access to all portions of double bottom. The size of the holes, including lightening holes, is to satisfy the requirements of standards or other normative documents recognized by the Register. Air and drain holes, cut-outs for the passage of welded joints, see 1.7.5.12.

2. The holes in centre girder, side girders and floors are to have a smooth rounded shape. The minimum allowable height of the plate adjoining bottom shell plating or inner bottom plating is indicated in Table 2.4.2.7.2. Besides, the minimum height of the plate in way of the hole is not to be less than $\frac{1}{8}$ of the length of the hole.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Floors:</td>
<td></td>
</tr>
<tr>
<td>plate</td>
<td>0.25</td>
</tr>
<tr>
<td>lightened</td>
<td>0.2</td>
</tr>
</tbody>
</table>

The plate height indicated in Table 2.4.2.7.2 may be reduced if suitable stiffening is provided. Besides, lightened side girder and floor plates are to satisfy the requirements of 2.4.4.5.5, and if the plate height $h_0$, in mm, exceeds $25s\sqrt{\frac{\pi}{4}}$ (where $s$ is the web thickness, in mm, of a lightened side girder or floor), the free edge of the plate is to be stiffened.

3. The distance between the edges of adjacent openings in centre girder, side girders and plate floors is not to be less than half the length of the largest opening.

The distance of the edges of openings in the floors from longitudinal bulkheads, centre girder, side girders, inclined margin plate and inner edges of hopper side tanks is not to be less than half the centre girder depth in this region. The distance of the edge of opening in a lightened floor from the side girder is not to be less than one-quarter of centre girder depth.

In exceptional cases, deviation from the above requirements is permitted.

4. One or more consecutive openings may be permitted in a lightened side girder web between adjacent floors or in a lightened floor web between adjacent side girders. In the latter case, vertical stiffeners are to be fitted between openings. The length of one opening is not to exceed 1.2 times the accepted depth of centre girder or 0.7 times the...
distance between floors (side girders) or between a floor (side girder) and vertical stiffener, whichever is less (see Fig. 2.4.2.5.1-2). The distance of the edges of openings in lightened side girders and floors from each other is not to be less than half the centre girder depth in this region.

.5 Normally, openings are not permitted:
- in centre girder over a length of 0.75L from the fore perpendicular;
- in centre girder and side girders (lightened side girders) under pillars and in sections adjoining transverse bulkheads (between the bulkhead and extreme floor for double bottom with transverse framing and on a length equal to the depth of double bottom with longitudinal framing);
- in floors under pillars and in way of partial longitudinal bulkheads;
- in floors at the toes of brackets transversely supporting main machinery seatings;
- in floors between the side (inner side) and the nearest lightened side girder, provided the spacing of floors is increased in accordance with 2.4.2.5.2.

In exceptional cases, openings are permitted in the above members provided the webs in way of the openings are suitably stiffened.

.6 Circular lightening openings are permitted for brackets, having a diameter not greater than \( \frac{1}{3} \) of the width or height of the bracket, whichever is less.

2.4.2.8 Where double skin side construction is provided, the inner bottom plating is to extend through the inner skin as far as the shell plating. A side girder is to be fitted in line with the inner skin. Festoon plates may be fitted in lieu of the inner bottom plating inside the double skin side or additional side girder in line with the inner skin.

2.4.2.9 Connections of bottom and inner bottom longitudinals to watertight floors should be such that the effective sectional area of these members is maintained.

2.4.3 Double bottom loading.

2.4.3.1 The external pressure on double bottom structures is determined by Formula (2.2.3-1).

For design ballast condition, the value of \( z_i \) in Formula (1.3.2.1-2) is to be counted from the design ballast waterline.

2.4.3.2 Double bottom loading from inside:
- .1 design pressure on the double bottom from general cargo is determined according to 1.3.4.1;
- .2 design pressure on the double bottom from liquid cargo or ballast is determined according to 1.3.4.2;
- .3 design pressure on the double bottom from bulk cargo is determined according to 1.3.4.3;
- .4 test loads

\[ p = 7.5h_p, \]

where \( h_p \) = vertical distance, in m, from inner bottom plating to the top of air pipe;

.5 loads due to the emergency flooding of double bottom compartments

\[ p = 10.5(d - h) \]

where \( h \) = actual depth of double bottom, in m.

2.4.3.3 The total design pressure on the double bottom is defined as a difference between the external pressure \( p \) and the cargo (ballast) pressure from inside \( p_c \). In this case, the value of \( p_c \) is defined as the smallest value of counterpressures determined from 2.4.3.2.1-2.4.3.2.3 with \( p > p_c \) and as the greatest of the above values with \( p < p_c \).

If a hold may be empty during service, the external pressure \( p \) is to be taken as the design pressure.

2.4.4 Scantlings of double bottom members.

2.4.4.1 At centre girder, the depth of double bottom \( h \), in m, is not to be less than:

\[ h = \frac{L - 40}{570} + 0.04B + 3.5d \frac{d}{L} \]

but not less than 0.65 m.

2.4.4.2 The centre girder and side girders are to satisfy the following requirements:

.1 The thickness, in mm, of centre girder (duct keel) is not to be less than:

\[ s = \alpha_{c,g} \frac{h}{B} \sqrt{\eta + \Delta s} \]

(2.4.4.2.1)

where \( h \) = height of centre girder, in m, required by 2.4.4.1; \( h_c \) = actual height of centre girder, in m; for \( \eta \), see 1.1.4.3; for \( \Delta s \), see 1.1.5.1; \( \alpha_{c,g} = 0.03L + 8.3 \), but not greater than 11.2.

In any case, the thickness of centre girder should be 1 mm greater than that of a plate floor.

The thickness of side girders is not to be less than that of plate floors.

.2 The buckling strength of centre girder web and of side girders, as well as of longitudinal stiffeners fitted along them is to be ensured in accordance with 1.6.5.

.3 At ends within 0.1L from the fore and after perpendiculars, the centre girder web thickness may be 10 per cent less than that in the midship region, as determined for steel used at ends, but not less than the minimum thickness stipulated under 2.4.4.9.

The thickness of side plates of the duct keel is not to be less than 0.9 of that required for the centre girder in this region.

.4 The thickness of watertight sections of centre girder and side girders is not to be less than determined by Formula (1.6.4.4) taking:

\[ p = \text{as determined by Formulæ (1.3.4.2-4) and (1.3.4.2-5) for the mid-depth of centre girder (side girder), whichever is the greater (where no safety valve is fitted, } p_c \text{ is to be taken as zero); } \]

\[ m = 15.8; \]
if the centre girder (side girder) is stiffened with vertical brackets or stiffeners,

\[ k_a = 0.6k_G \leq 0.75 \text{ for } L \geq 65 \text{ m in the midship region}; \]
\[ k_a = 0.75 \text{ for } L = 12 \text{ m}. \]

For \( 12 < L < 65 \text{ m}, k_a \) is to be determined by linear interpolation taking \( k_a = 0.68 \) for \( L = 65 \text{ m}; \)

if the centre girder (side girder) is stiffened with horizontal stiffeners, in the midship region

\[ k_a = 0.75; \]

at the ends of the ship within \( 0.1L \) from the fore or after perpendicular

\[ k_a = 0.85. \]

For regions between the midship region and above portions of ship’s ends, \( k_a \) is to be determined by linear interpolation.

For regions lying between the midship region and the above areas of ship ends, \( k_a \) is to be determined by linear interpolation.

The thickness of the watertight sections of centre girder and side girders need not be greater than that of adjacent shell plating.

**2.4.4.3** Floors are to satisfy the following requirements:

.1 The thickness, in mm, of watertight floors is not to be less than:

\[ s = 2ka\sqrt{\eta} + 0.3, \]

(2.4.4.3-1)

where \( \eta = 0.12L - 1.1 \), but not greater than 6.5 for transversely framed double bottom;

\( x = 0.033L + 5.8 \) for longitudinally framed double bottom;

\( k_a, k_b \) = coefficients given in Tables 2.4.4.3-1 and 2.4.4.3-2 respectively;

\( a = \text{spacing, in m, of stiffeners, but not greater than the actual depth of double bottom;} \)

for \( a_N \), see 1.1.4.3;

for \( A_N \), see 1.1.5.1.

Symbols:

\( a_i = \text{distance, in m, between plate floors;} \)

\( a = \text{spacing, in m;} \)

**2.4.4.4** Inner bottom plating and margin plate are to satisfy the following requirements:

.1 The thickness of inner bottom plating, including margin plate, is not to be less than determined by Formula (1.6.4.4) taking:

\( m = 15.8; \)

\( p = \text{maximum design pressure as stipulated under 2.4.3.2;} \)

\( k_a = 0.6k_G \leq 0.8 \) in the midship region for \( L \geq 65 \text{ m} \) and transverse framing system;

\( k_a = 0.8 \) in the midship region for \( L = 12 \text{ m} \) and transverse framing system.

Where \( 12 < L < 65 \text{ m}, k_a \) is determined by linear interpolation taking \( k_a = 0.7 \) for \( L = 65 \text{ m}, \)

\( k_a = 0.8 \) in the midship region for longitudinal framing system;

\( k_a = 0.9 \) at the ends of the ship within \( 0.1L \) from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, \( k_a \) is to be determined by linear interpolation.

\( k_g \) is to be determined by Formula (2.2.4.1).

.2 In any case, the thickness of inner bottom plating \( s_{\text{min}} \), in mm, is not to be less than:

\[ s_{\text{min}} = (3.8 + 0.05L)\sqrt{\eta} \text{ for } L < 80 \text{ m}; \]
\[ s_{\text{min}} = (5 + 0.035L)\sqrt{\eta} \text{ for } L \geq 80 \text{ m}, \]

(2.4.4.4.2)

where \( \eta = \text{as stated in Table 1.1.4.3.} \)

Where \( L > 260 \text{ m}, L \) is to be taken equal to 260 m.

Where the adopted spacing is less than the standard one (see 1.1.3) for ships of unrestricted area of navigation and limited area of navigation I, the minimum thickness
of inner-bottom plating may be reduced in proportion to the ratio of adopted spacing to the standard spacing, but not more than by 10 per cent. In any case, the minimum thickness is not to be less than 5.5 mm. The thickness of inner bottom plating in holds into which water ballast may be taken, as well as in the cargo (ballast) tanks of tankers is not to be less than stipulated under 3.5.4.

In the engine room and holds under cargo hatches where no wood sheathing is provided, $s_{\text{min}}$ is to be increased by 2 mm. 

In holds where no wood sheathing is provided and cargo is discharged by grabs, $s_{\text{min}}$ is to be increased by 4 mm.

.3 In the midship region of ships of 65 m and greater in length, the buckling strength of inner bottom plating and margin plate is to be ensured in accordance with 1.6.5.

2.4.4.5 Primary members of bottom and inner bottom are to satisfy the following requirements:

.1 The section modulus of bottom and inner bottom longitudinal, as well as of the bottom and reverse frames of bracket floors and duct keel is not to be less than stipulated under 1.6.4.1 taking

\[ p = \text{design pressure, in kPa, determined for bottom}\]

longitudinals and the bottom frames of bracket floors and duct keel in accordance with 2.4.3.1, and for inner bottom longitudinal and the reverse frames of bracket floors and duct keel, in accordance with 2.4.3.2;

\[ m = 12; \]

\[ l = \text{design span, in m, of longitudinal, defined as the spacing of floors for bottom and inner bottom longitudinal, as the distance between bracket toes or between a bracket toe and side girder for the bottom and reverse frames of bracket floors, as the spacing of webs for duct keel;} \]

\[ k_a = 0.45k_B \leq 0.65 \text{ in the midship region;} \]

\[ k_a = 0.65 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.} \]

For regions between the midship region and the above portions of ship’s ends, $k_a$ is to be determined by linear interpolation;

for bottom longitudinal

\[ k_a = 0.65k_B \leq 0.75 \text{ in the midship region;} \]

\[ k_a = 0.75 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.} \]

For regions between the midship region and the above portions of ship’s ends, $k_a$ is to be determined by linear interpolation;

for bottom frames of bracket floors and duct keel

\[ k_a = 0.65; \]

for reverse frames of bracket floors and duct keel

\[ k_a = 0.75. \]

$k_B$ is to be determined by Formula (2.2.4.1).

.2 If intermediate struts are fitted at mid-span between bottom and inner bottom longitudinals, the section modulus of such longitudinals may be reduced by 35 per cent.

.3 If the ratio of the span of a bottom or inner bottom longitudinal to its depth is less than 10, the sectional area of the longitudinal web is not to be less than determined by Formula (1.6.4.3) taking

\[ N_{\text{max}} = 0.5pL \text{ (p, l= design pressure and design span of longitudinal as stipulated under 2.4.4.5.1)} \]

\[ k_x = k_a \]

where $k_a$ is as determined from 2.4.4.5.1 with $k_B = 1.25$.

.4 In the midship region of ships of 65 m in length and above, the buckling strength of bottom and inner bottom longitudinals is to be ensured in accordance with 1.6.5.

.5 At the centre of openings in the lightened side girders and floors, the section modulus of the plate adjoining the shell plating or inner bottom plating is to comply with the requirements of 2.4.4.5.1 for bottom and inner bottom longitudinals and transverses respectively. In this case, the design span $l$ is to be taken equal to the greatest opening length minus its rounding-off radius. The plate section is to include the effective flange of shell plating (inner bottom plating), as described under 1.6.3.2 and 1.6.3.3, as well as the flange or horizontal stiffener of the free edge of the plate, if these are fitted.

2.4.4.6 The stiffeners on the watertight sections of centre girder (duct keel), side girders and floors are to satisfy the following requirements:

.1 The section modulus of vertical stiffeners on the watertight sections of centre girder (duct keel), side girders and floors is not to be less than stipulated under 1.6.4.1 taking

\[ p = \text{as determined by Formula (1.3.4.2-5) for midheight of vertical stiffener;} \]

\[ l = \text{span, in m, of stiffener, defined as the spacing of longitudinals to which the stiffener is welded or as double bottom depth if the stiffener is not in line with bottom or inner bottom longitudinals; } \]

\[ m = 8 \text{ and 10 for stiffeners sniped at ends and welded to the bottom and inner bottom longitudinals respectively; } \]

\[ k_a = 0.75. \]

.2 The section modulus of horizontal stiffeners on the centre girder (duct keel) and side girders is not to be less than stipulated under 1.6.4.1 taking

\[ p = \text{as determined by Formula (1.3.4.2-5) for the level of the horizontal stiffener considered;} \]

\[ l = \text{distance, in m, between floors or between floors and brackets (see 2.4.2.2); } \]

\[ m = 12; \]

\[ k_a = 0.5k_B \leq 0.75 \text{ in the midship region;} \]

\[ k_a = 0.75 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.} \]
For regions between the midship region and the above portions of ship’s ends, \( k_a \) is to be determined by linear interpolation.

\( k_B \) is to be determined by Formula (2.2.4.1).

.3 In the midship region of ships of unrestricted service and of restricted areas of navigation I and II, 65 m and greater in length, as well as of ships of restricted areas of navigation II CII, III CII and III, 60 m and greater in length, the buckling strength of horizontal stiffeners on the centre girder (duct keel) and side girders is to be ensured in accordance with 1.6.5.

2.4.4.7 The intermediate struts between bottom and inner bottom longitudinals, as well as between bottom and reverse frames of bracket floors are to satisfy the following requirements:

.1 The sectional area \( f \), in \( \text{cm}^2 \), of intermediate struts is not to be less than:

\[
 f = \frac{5p_{al}}{k_a\sigma_n} + 0.1h\Delta s \tag{2.4.4.7.1}
\]

where \( p = \) design pressure, in kPa, defined as the greater of the values of \( p_1 \) or \( p_2 \), according to 2.4.3.1 or 2.4.3.2, whichever is the greater;

\( l = \) design span, in m, of stiffened longitudinals;

\( k_a = 0.6 \);

\( h = \) height, in cm, of the strut cross section.

.2 The inertia moment \( i \), in \( \text{cm}^2 \), of intermediate struts is not to be less than:

\[
 i = 0.01f^2\sigma_n \tag{2.4.4.7.2}
\]

where \( f = \) sectional area of intermediate struts as given in 2.4.4.7.1;

\( l = \) length, in m, of intermediate strut.

2.4.4.8 The thickness of brackets of centre girder (duct keel) and margin plate, as well as of the brackets of bracket floors and the brackets connecting bottom and inner bottom longitudinals to watertight floors, if the longitudinals are cut at the floors, is not to be less than the thickness of plate floors adopted in this region.

In way of centre girder and margin plate, the thickness of brackets fitted in line with the bracket floor is not to be less than 0.75 of the centre girder depth. The free edges of brackets are to be provided with flanges or face plates. The side girder fitted in line with the bracket floor should be provided with a vertical stiffener whose profile is to be selected in the same way as that of the reverse frame of the floor.

The arm length of brackets connecting longitudinals on the bottom and inner bottom plating to watertight floors is not to be less than 2.5 times the bottom longitudinal depth (Fig. 2.4.4.8).

The scantlings of knees by which bottom and reverse frames of the duct keel are secured are to be determined in accordance with 1.7.2.2.

2.4.4.9 Structural members inside the double bottom are to have a thickness \( s_{min} \), in mm, not less than:

\[
 s_{min} = 0.045L + 3.9 \quad \text{for} \quad L < 80 \text{ m};
 s_{min} = 0.025L + 5.5 \quad \text{for} \quad L \geq 80 \text{ m}. \tag{2.4.4.9}
\]

Where \( L > 250 \text{ m}, L \) is to be taken equal to 250 m. For centre girder, \( s_{min} \) is to be increased by 1.5 mm.

2.4.4.10 In way of holds designed for the carriage of heavy cargoes, the strength of double bottom structure should be verified by the calculation of the bottom grillage strength using design loads stated in 2.4.3., as required by 3.3.4.1.1.

2.4.5 Special requirements.

2.4.5.1 Partial double bottom and stiffening in way of variable double bottom depth are to satisfy the following requirements:

.1 Where the double bottom terminates, gradual transition from longitudinal members of double bottom to those beyond it is to be ensured.

The inner bottom plating is to be gradually tapered (on a length of at least three frame spaces) into the face plates of centre girder and side girders of single bottom. In way of the double bottom boundary, the width of these face plates is to be not less than half the distance between adjacent side girders.

The margin plate is to extend beyond the double bottom as a bracket with the height equal to the margin plate width and the length equal to at least three frame spaces, with a face plate or flange along its free edge.

.2 Where the double bottom depth changes in the form of a knuckle, one end of the knuckle should be in way of a transverse bulkhead and the other, on the fplate floor. However, both the knuckles may be arranged on plate floors in which case the structure is subject to special consideration by the Register.

.3 Where the double bottom depth changes in the form of a step, the latter should normally be arranged on a transverse bulkhead.

At the step, the inner bottom plating of the lower section should extend for a length of three frame spaces when \( L \geq 80 \text{ m} \) and for two frame spaces when \( L < 80 \text{ m} \). Forward (or aft) of the end of the extension
the general requirements for partial double bottom are to be complied with.

If the step is arranged beyond 0.5L amidships or if the height of the step is less than 660 mm, the double bottom structure in way of the extension is in each case subject the special consideration by the Register.

4.4 Continuity and reduction of stress concentrations should be ensured in way of the step where a variation of the depth of centre girder, side girders, margin plate and inner bottom longitudinals takes place (if longitudinal system of framing is adopted).

2.4.5.2 Bilge wells, sea chests and ice boxes are to satisfy the following requirements:

1. In cargo ships, the bilge wells should, as far as practicable, satisfy the requirements of 1.1.6.3.3.

The capacity of bilge wells is specified in Part VIII "Systems and Piping".

The thickness of the walls and bottom plate of a bilge well is to exceed that of watertight floors by not less than 2 mm.

2. The thickness of the floors, side girders and inner bottom plating forming the walls of sea chest is to be 2 mm greater than that required by 2.4.4.2 — 2.4.4.4, with the test head according to item 9 of the Appendix.

In any case, the thickness of sea chest and ice box walls is to be not less than that required by 2.2.4.1 for the shell plating in the region under consideration.

2.4.5.3 When oil fuel tanks are arranged in the double bottom, the manholes in the tank tops arranged within the engine and boiler rooms for access to the tanks are to be provided with coamings not less than 0.1 m in height, besides the general provisions for the arrangement of oil fuel tanks.

2.4.5.4 Where the bed plate of main engine and the thrust block are seated directly on the inner bottom plating, insert plates having a thickness not less than stipulated under 2.11.3.1 are to be welded to the plating under the supporting parts of bed plate and thrust block. The size of welded inserts should be such as to ensure an adequate arrangement of supports and the attachment of machinery, and should in any case be not less than that of the supporting parts of bed plate. Where the engine bed plate and thrust block are fitted on the inner bottom plating, two girders, or one girder and a half-height girder should be provided in way of their arrangement along each welded insert plate. The upper part of the girder webs should have the same thickness as the welded insert for at least 0.2 of the girder depth, or alternatively, the thickness of the webs throughout their depth should be as required by 2.11.3 for the vertical plates of seatings.

Between the girders, a horizontal stiffener of the size required in the foregoing for the upper part of girder webs should be fitted, account being taken of the holes for the holddown bolts of the bed plate.

On agreement with the Register, only one side girder may be fitted under the welded insert plate for small power engines.

2.4.5.5 The plating of the recess under the engine crankcase, as well as the side girders and floors by which it is confined, are to have a thickness 2 mm greater than that of the inner bottom plating in this region.

The minimum distance from the recess plating to the bottom shell plating is not to be less than 460 mm.

2.5 SIDE FRAMING

2.5.1 General and definitions.

2.5.1.1 Requirements are given in this Chapter for side frames, web frames (side transverses), side longitudinals, side stringers, cross ties connecting side transverses to vertical webs on longitudinal bulkheads in tankers, as well as for specific structures of double skin side.

2.5.1.2 By the double skin side construction, a side structure is meant which consists of watertight side shell plating and inner skin, both either strengthened with frames and longitudinals or not, and connected with plate structures perpendicular thereto: vertical (diaphragms) and/or horizontal (platforms). If no diaphragms or platforms are fitted, the inner skin together with framing is to be considered as longitudinal bulkhead and is to comply with the requirements of 2.7.

2.5.2 Construction.

2.5.2.1 When the ship’s side is framed transversely, side stringers may be provided. In tankers with two or more longitudinal bulkheads, fitting of cross ties is recommended between the side stringers and horizontal girders of longitudinal bulkheads.

Web frames may be fitted if the ship’s side is framed transversely, and they are to be fitted, if the ship’s side is framed longitudinally. They are to be fitted in line with plate floors, as well as with deep beams, if any. In tankers with two or more longitudinal bulkheads, fitting of cross ties is recommended between side transverses and vertical webs of longitudinal bulkheads.

2.5.2.2 Structures of double skin side are to satisfy the following requirements:

1. If the same framing system is adopted for side shell and inner skin, fitting of frames or longitudinal of both side shell and inner skin in line with each other is recommended. In this case, cross ties may be fitted between the frames or longitudinals of the side shell and inner skin, which are to be arranged at mid-span of relevant members.
.2 Diaphragms or platforms are to be stiffened in accordance with 1.7.3.2. In this case, the shorter side, in mm, of panel of the diaphragm or platform being stiffened is not to exceed \(100\sqrt{s/\eta}\), where \(s\) is the thickness, in mm, of the diaphragm or platform.

.3 An appropriate number of openings (manholes) are to be provided in the diaphragms and platforms for access to all the structures of double skin side. The total breadth of openings in a diaphragm or platform section is not to exceed 0.6 of the double skin side breadth.

The edges of openings in diaphragms and platforms, arranged within \(1/4\) of the span from their supports, are to be reinforced with collars or stiffeners. The distance between the edges of adjacent openings is not to be less than the length of the openings.

Normally, openings are not permitted, with the exception of air and drain holes:

- In platforms on a length not less than three frame spaces or 1.5 times the double skin side breadth, whichever is less, from transverse bulkheads or partial bulkheads, which serve as platform supports;
- In diaphragms on a length not less than 1.5 times the double skin side breadth from deck plating and/or double bottom, which serve as diaphragm supports.

2.5.2.3 In the machinery space, the side framing is to be strengthened by fitting of web frames and side stringers.

The web frames are to be fitted not more than 5 standard spacings or 3 m apart, whichever is the greater. The web frames are to be arranged taking into account the location of main engine, i.e. they are to be fitted at the extremities of the engine at least. In the machinery space, the web frames are to be carried to the nearest continuous platform. Deep beams are to be fitted in line with web frames.

In the machinery space, the side stringers are to be fitted so that the vertical distance between them, as well as between a side stringer and deck or tank top (upper edge of floor) at side does not exceed 2.5 m.

2.5.3 Side loading.

2.5.3.1 The design pressure on the side shell is to be determined in accordance with 2.2.3. In way of tanks, the pressure determined in accordance with 1.3.4.2 should additionally be taken into consideration.

2.5.3.2 The design pressure on double skin side structures is to be determined as follows:

.1 The design pressure on the inner skin and framing is to be determined in accordance with 1.3.4.2 or 1.3.4.3 depending on the kind of cargo carried and on whether the double skin side space is used as tank space, but is not to be less than the design pressure on watertight bulkhead structures, as stipulated under 2.7.3.1.

.2 The scantlings of cross sections of diaphragms and platforms are determined using the design pressure specified in 2.2.3.

.3 The design pressure on the watertight sections of diaphragms and platforms bounding the tanks in the inter-skin space is to be determined in accordance with 1.3.4.2.

2.5.4 Member scantlings of side structures.

2.5.4.1 If transverse system of framing is adopted, the section modulus of hold frames in dry cargo ships and of side frames in tankers is not to be less than determined from 1.6.4.1 taking:

- \(p\) as defined in 2.5.3; the value of \(p\) for the side shell is not to be less than determined from the following formulae:

\[
p_{\text{min}} = 10z + 0.3L + 1 \quad \text{for} \quad L < 60 \text{ m};
\]

\[
p_{\text{min}} = 10z + 0.15L + 10 \quad \text{for} \quad L \geq 60 \text{ m}
\]

where \(z\) = distance, in m, from the mid-span of the frame to the summer load waterline;

\[\text{l} = \text{span, in m, between adjacent supports, as measured in accordance with 1.6.3.1; unless expressly provided otherwise, the supports of a frame are bottom, deck or platform, side stringers;}
\]

\(m = 12\) for single skin side construction when determining the section modulus of the supporting section of the frame taking into consideration the bracket, if any, included in the section, as well as for frames of the side shell and inner skin forming double skin side construction;

\(m = 18\) for single skin side construction when determining the section modulus in the frame span;

\(k_a = 0.65\) for frames of the side shell;

\(k_a = 0.75\) for frames of the inner skin.

For ships of restricted area of navigation, the value of \(p_{\text{min}}\) may be reduced by multiplying by the factor \(\varphi_s\) obtained from Table 1.3.1.5.

2.5.4.2 The section modulus of "tween deck frames is not to be less than determined from 1.6.4.1 taking:

- \(p\) = design pressure, as stipulated under 2.5.3;

\[\text{l} = \text{span, in m, between adjacent supports, as measured in accordance with 1.6.3.1; frame supports are decks and platforms;}
\]

\(m = 10\) for single skin side frames;

\(m = 12\) for frames of the side shell and inner skin forming double skin side construction;

\(k_a = 0.65\) for side shell frames;

\(k_a = 0.75\) for inner skin frames.

The above applies in case the lower end of "tween deck frame is not stiffened by a bracket. If the lower end of the frame is stiffened by a bracket of a height not less than 0.1l and the section modulus of the frame in way of deck is not less than 1.75 of the section modulus determined above, taking the bracket into consideration, the section modulus of "tween deck frame may be reduced by 30 per cent.
2.5.4.3 The section modulus of side longitudinals of all ships is not to be less than determined according to 1.6.4.1 taking:

\[ p = \text{as defined in 2.5.3}; \]
\[ a = \text{spacing of longitudinals, in m}; \]
\[ l = \text{average spacing of web frames or diaphragms, in m}; \]
\[ m = 12; \]

for side shell

\[ k_a = 0.65 \text{ within } (0.4 - 0.5)D \text{ from the base line.} \]

For regions below 0.4D from the base line, \( k_a \) is to be determined by linear interpolation between \( k_a \) for bottom longitudinals in accordance with 2.4.4.5.1 and \( k_a \) within \((0.4 - 0.5)D\) from the base line.

For regions above 0.5D from the base line, \( k_a \) is to be determined by linear interpolation between \( k_a \) for strength deck longitudinals in accordance with 2.6.4.2 and \( k_a \) within \((0.4 - 0.5)D\) from the base line.

For the inner skin, \( k_a \) is to be determined as in the case of horizontal stiffeners of longitudinal bulkheads in tankers in accordance with 2.7.4.2.

The buckling strength of three upper and three lower longitudinals in the midship region of ships 65 m and greater in length is to be ensured in accordance with 1.6.5.

2.5.4.4 In a transversely framed side, the section modulus of side stringers is not to be less than stipulated under 1.6.4.1 taking:

\[ k_a \] is determined in the same way as for side shell longitudinals mentioned under 2.5.4.3;
\[ p = \text{as defined in 2.5.3.1}; \]
\[ l = \text{spacing, in m, of web frames and where these are not fitted, between transverse bulkheads, including end brackets}; \]
\[ a = \text{spacing, in m, of side stringers}; \]
\[ m = 18 \text{ without cross ties}; \]
\[ m = 27.5 \text{ with cross ties}. \]

The cross-sectional area, in cm², of a side stringer web is not to be less than determined according to 1.6.4.3 taking:

\[ N_{max} = n p a l; \]
\[ n = 0.5 \text{ without cross ties}; \]
\[ n = 0.4 \text{ with one cross tie}; \]
\[ n = 0.375 \text{ with two cross ties}; \]
\[ n = 0.35 \text{ with three cross ties}; \]
\[ k_s = 0.65. \]

If web frames are fitted, the scantlings of side stringer section may be determined on the basis of the calculation of the side grillage using beam models. The design loads are to be determined in accordance with 2.5.3.1, permissible stress factors are to be selected in accordance with this paragraph. Where cross ties are fitted, the calculation should consider the interaction between side grillage and grillage of the longitudinal bulkhead being connected with the cross ties.

2.5.4.5 The section modulus of web frames (side transverses) fitted in the holds and 'tween decks of dry cargo ships, as well as in the tanks of tankers, is not to be less than stipulated under 1.6.4.1 and 1.6.4.2 taking:

\[ p = \text{as defined in 2.5.3.1}; \]
\[ l = \text{distance, in m, from the upper edge of a single bottom floor or from inner bottom plating to the lower edge of a deep beam}; \]
\[ a = \text{spacing of web frames, in m}; \]
\[ m = 10 \text{ for 'tween deck frames}; \]
\[ m = 11 \text{ for holds and tanks without cross ties}; \]
\[ m = 18 \text{ with one or two cross ties}; \]
\[ m = 27.5 \text{ with three cross ties}; \]
\[ k_a = 0.65. \]

The cross-sectional area, in cm², of a side transverse (web frame) web, excluding openings, is not to be less than stipulated under 1.6.4.3 taking:

\[ N_{max} = n p a l; \]
\[ n = 0.5 \text{ without cross ties}; \]
\[ n = 0.375 \text{ with one cross tie}; \]
\[ n = 0.35 \text{ with two or more cross ties}; \]
\[ k_s = 0.65. \]

When the side is transversely framed, the scantlings of web frames may be determined on the basis of the side grillage calculation in accordance with the requirements of 2.5.4.4. In this case, the permissible stress factors are to be selected in accordance with the requirements of this paragraph.

In single-deck ships, the depth of web frame (side transverse) webs may be taken variable over the ship’s depth with reducing at the top end and increasing at the bottom end. Variation of web depth is not to exceed 10 per cent of its mean value.

For stiffening of web frames (side transverses), see 1.7.3.

2.5.4.6 The sectional area \( f \), in cm², of a cross tie fitted between deep members of side framing and of longitudinal bulkhead is not to be less than:

\[ f = k \frac{10 p a e}{a_s} + 0.05 \Sigma h A s \]  

(2.5.4.6)

where \( p = \text{pressure, in kPa, at mid-length of a cross tie, as determined from 2.2.3 or 2.7.3.2, whichever is the greater; } \)
\( a = \text{spacing of web frames connected with cross ties, in m}; \)
\( a_s = \text{mean depth, in m, of side area supported by a cross tie}; \)
\( \Sigma h = \text{perimeter of cross section, in cm, of a cross tie}; \)
\( k = 2.5 \text{ -- buckling strength margin}; \)
\( \sigma_e = \text{critical stresses in accordance with 1.6.5.3 corresponding to the Euler stresses, in MPa, as determined by the formula } \)

\[ \sigma_e = \frac{206 i}{l^2} \]

where \( i = \text{minimum moment of inertia, in cm}^4, \text{of a cross tie}; \)
\( l = \text{cross tie length, in m, as measured between the inner edges of deep members of side framing and of longitudinal bulkhead}; \)
\( f = \text{as determined by Formula (2.5.4.6)} \).

2.5.4.7 The side framing of the machinery space and tanks is to satisfy the following requirements:

1. The scantlings of main frames in the machinery space are to be determined in accordance with 2.5.4.1 taking:
\[ l = \text{span measured between side stringers or between the lower side stringer and inner bottom plating (upper edge of floor), or between the upper side stringer and the lower edge of beam.} \]

The scantlings of longitudinals are to be determined in accordance with 2.5.4.3.

The scantlings of web frames (side transverses) are to be determined in accordance with 2.5.4.5 taking:

\[ l = \text{span measured between inner bottom plating (upper edge of floor) and the lower edge of deep beam.} \]

2. In the machinery space of ships less than 30 m in length, the web frames and side stringers required by 2.5.2.3 may be omitted on condition that the main frame has a section modulus \( W \), in cm³, not less than:

\[ W = 1.8W_1 \quad (2.5.4.7.2) \]

where \( W_1 = \text{section modulus of main frame, as stipulated under 2.5.4.1.} \]

3. In way of the ballast and fuel oil tanks of dry cargo ships 30 m and greater in length, the scantlings of side framing are to satisfy the requirements of 2.5.4.1, 2.5.4.3, 2.5.4.5 for side framing in way of tanks in tankers.

If transverse system of framing is adopted, the section modulus of side stringers is not to be less than determined according to 1.6.4.1 and 1.6.4.2 taking:

\[ k_a = 0.65; \]

\[ m = 10. \]

In all other respects, the requirements of 2.5.4.4 are to be complied with.

4. In the machinery space, the web frames are to have a depth not less than 0.1 of the span, and a web thickness not less than 0.01 of the web depth plus 3.5 mm.

5. In the machinery space, the web depth of a side stringer is to be equal to that of a web frame.

The web thickness of a side stringer may be 1 mm less than that of a web frame. The side stringer face plate thickness is to be equal to the face plate thickness of a web frame.

2.5.4.8 The diaphragms and platforms of the double skin side are to satisfy the following requirements:

1. The section moduli and cross-sectional areas of diaphragms and platforms are to satisfy the requirements for the section moduli and cross-sectional areas of side stringer webs, as specified in 2.5.4.4, and of web frames, as specified in 2.5.4.5, using the design pressure determined in accordance with 2.5.3.2.2.

In any case, the thickness, in mm, of diaphragm and platform is not to be less than:

\[ s_{min} = 0.018L + 6.2. \quad (2.5.4.8) \]

2. The stiffeners of diaphragms and platforms are to satisfy the requirements of 1.7.3.2.2.

3. The platforms in the midship region and their continuous longitudinal stiffeners, if any, are to comply with the requirements for the buckling strength of longitudinal framing members, as specified in 1.6.5.2, within 0.25\( D \) above the base line and 0.25\( D \) below the strength deck.

4. The thickness of watertight sections of diaphragms and platforms is not to be less than that determined by Formula (1.6.4.4) taking:

\[ p = \text{as defined in 2.5.3.2.3;} \]

\[ m = 15.8; \]

\[ k_a = 0.9. \]

5. The section modulus of stiffeners of the watertight sections of diaphragms and platforms is not to be less than determined from 1.6.4.1 taking:

\[ p = \text{as defined in 2.5.3.2.3;} \]

\[ l = \text{span of stiffener, in m, equal to: the diaphragm spacing, for stiffeners parallel to the shell plating; the distance between the inner edges of primary members of side shell and inner skin if the stiffener is welded thereto, for stiffeners perpendicular to the shell plating; the double skin side breadth if the stiffener ends are snipped;} \]

\[ m = 12 \text{ for continuous stiffeners parallel to the side plating;} \]

\[ m = 10 \text{ for stiffeners perpendicular to the side plating and welded to primary framing members;} \]

\[ k_a = 0.75. \]

2.5.4.9 If there are large openings (exceeding 0.7 times the ship’s breadth in width) in the deck, stiffening of the diaphragms and frames of the side shell and inner skin may be required on agreement with the Register in connection with the upper deck pliability, which is to be determined by calculation (see also 3.1.4).

2.5.4.10 The thickness of inner skin is to comply with the requirements for the thickness of longitudinal bulkhead plating in tankers, as specified in 2.7.4.1, using the design pressure determined in accordance with 2.5.3.2.1. In any case, this thickness is not to be less than determined by Formula (2.7.4.1-1).

2.5.4.11 The cross ties between frames and longitudinals of side shell and inner skin, as mentioned under 2.5.2.2.1, are to comply with the requirements for the intermediate struts of double bottom, as mentioned in 2.4.4.7 using the design pressure determined from 2.5.3.1 or 2.5.3.2.1, whichever is the greater.

If cross ties are fitted, the section modulus of frames complying with 2.5.4.1 and 2.5.4.2, as well as of longitudinals complying with 2.5.4.3, may be reduced by 35 per cent.
2.5.4.12 In the cargo and ballast tanks of tankers, in holds into which water ballast can be taken and in tanks, the thickness of structural members of side framing is not to be less than that required by 3.5.4.

2.5.5 Special requirements.

2.5.5.1 If transverse system of framing is adopted, efficient connection of lower ends of frames to bottom structures is to be ensured by means of bilge brackets or other structures of equivalent strength. The bilge brackets are to comply with the following requirements:

.1 The depth of bilge brackets is not to be less than that of the bilge as a whole. The free edge of a bilge bracket is to be flanged or stiffened with a face plate the dimensions of which are to be in compliance with 1.7.2.2.2.

The thickness of a bilge bracket is taken equal to that of plate floors in the hull region under consideration, but it need not exceed the frame web thickness more than 1.5 times.

Holes cut in bilge brackets are to be such that the width of plating outside the hole is nowhere less than \( \frac{1}{3} \) of the bracket width.

In any case, the size of bilge brackets is not to be less than that required by 1.7.2.2.

.2 The end attachments of a frame to bilge bracket are to be designed so that at no section the section modulus is less than required for a frame.

.3 Where an inclined margin plate is fitted in the double bottom, the bilge bracket is to be carried to the inner bottom plating, and its face plate (flange) is to be welded to the plating.

.4 Where a horizontal margin plate is fitted in the double bottom or transverse system of framing is adopted in the single bottom, the width of bilge brackets is to be determined proceeding from the condition that their section moduli at the point of connection to the inner bottom plating or upper edge of floor should be at least twice those of the frame.

The face plate (flange) of a bilge bracket may be welded to either the inner bottom plating or the face plate (flange) of a floor, or it may be snipped at ends. If the face plate (flange) is welded, the floor web is to be stiffened with a vertical stiffener or a bracket at the point of welding, also welded to the inner bottom plating or to the floor face plate (flange).

The depth of a bilge bracket is not to be less than its width.

.5 If longitudinal system of framing is adopted in the single bottom, the bilge bracket is to be carried at least to the bottom longitudinal nearest to the side and is to be welded thereto. The section modulus of the bracket at the section perpendicular to the shell plating where the bracket width is the greatest should be at least twice the section modulus of the frame.

2.5.5.2 In all the spaces, the upper ends of frames are to be carried to the decks (platforms) with minimum gaps if they are cut at the decks (platforms). The beams of transversely framed decks (platforms) are to be carried to the inner edges of frames with minimum gaps.

The uppermost decks of ships (except for those secured alongside other ships at sea) may be designed with beams carried to the shell plating with minimum gaps, and frames carried to the beams.

The brackets by which the upper ends of frames are attached are to be sized in accordance with the requirements of 1.7.2.2. If the deck is framed longitudinally, the bracket should be carried at least to the deck longitudinal nearest to the deck and welded to that longitudinal.

2.5.5.3 If the frame is cut at deck, its lower end is to be attached by a bracket complying with the requirements of 1.7.2.2. The bracket may be omitted if the ends of this frame are welded to the deck plating from above and below, and full penetration is ensured.

2.5.5.4 Side stringers are to be attached to web frames by brackets carried to the web frame face plate and welded thereto.

2.5.5.5 If cross ties are fitted in the wing tanks of tankers, the side transverse and side stringer webs in way of the cross tie attachments are to be provided with stiffeners which are to be an extension of the cross tie face plates. Cross tie attachments to side transverse (side stringer) should comply with the requirements of 1.7.2.3.

2.6 DECKS AND PLATFORMS

2.6.1 General.

2.6.1.1 Requirements are given in this chapter for the deck and platform structures of ships where the width of opening for a single cargo hatch does not exceed 0.7 times the ship’s breadth abreast of the opening. Additional requirements for the decks and platforms of ships having greater width of openings and their length exceeding 0.7 times the spacing of centres of transverse deck strips between the openings, as well as for the decks and platforms of ships with twin or triple hatch openings, are specified in 3.1.

Requirements for cantilever beams are also to be found there.

For decks and platforms of ro-ro ships, see 3.2.

Requirements for the cargo hatch coamings of bulk carriers are given in 3.3.

Requirements of this chapter cover plating and framing members of decks and platforms: deck longitudinals, beams, deck transverses, deck girders,
hatch end beams, hatch side coamings and hatch end coamings, wash plate in the tanks of tankers.

Additional requirements for the areas of upper deck situated below the superstructures are given in 2.12.5.1 — 2.12.5.3.

2.6.2 Construction.

2.6.2.1 In tankers of 80 m and above, bulk carriers and ore carriers, as well as in oil/dry bulk cargo carriers, and ore/oil carriers, longitudinal system of framing is to be adopted for the strength deck in way of cargo holds (tanks).

Where longitudinal system of framing is adopted, the spacing of deck transverses is not to exceed that of bottom transverses.

2.6.2.2 Provision is to be made for the structural continuity of deck girders of the strength deck in the midship region. If the deck girders are cut at transverse bulkheads, their web plates are to be welded to the transverse bulkheads and attached thereto by brackets.

The web plates of hatch end coamings, deck transverses, hatch end beams and wash plates are to be strengthened by stiffeners and brackets (see 1.7.3).

The face plates of deck girders should be connected to the face plates of hatch end beams by means of diamond plates (see 1.7.4.5) whose thickness is to be equal to the greater face plate thickness.

2.6.2.3 On the strength deck, the ends of side coamings at the corners of hatchways are to be either bent along the line of hatch corner rounding and butt-welded to the hatch end coaming or extended, in the form of a bracket, beyond the corner of the hatchway. Provision is to be made for a gradual termination of the bracket above the deck girder web.

The upper edges of coamings acting as deck girders should be stiffened with face plates and the lower edges of the coamings are to be rounded.

The upper edge of hatch side coaming should be smooth and their corners should be well rounded in the transverse direction.

2.6.2.4 The deck girders and deck transverses in way of pillars are to be strengthened by stiffeners or tripping brackets.

Where deck girders are connected to deck transverses and their web height is different, the deck girder web is to be strengthened by brackets fitted in line with the deck transverse. The brackets should be welded to the face plate of deck transverse, to the web and face plate of deck girder.

Where deck girders are attached to conventional beams, the web of deck girder should be strengthened by vertical stiffeners.

2.6.2.5 In the case of connection of deck longitudinals to transverse bulkheads, the effective sectional area of the longitudinals is to be maintained.

2.6.2.6 In tankers with two effective longitudinal bulkheads, provision is to be made for a wash plate at the centreline.

2.6.3 Deck loading.

2.6.3.1 The design pressure on the weather deck is not to be less than:

\[ p = 0.7 p_w \geq p_{\text{min}}, \]

where \( p_w \) = wave load at the deck level, as defined in 1.3.2.2;

\[ p_{\text{min}} = 0.1 L + 7 \] at the fore end within 0.2L from the forward perpendicular;

\[ p_{\text{min}} = 0.015 L + 7 \] in the midship region and aft of the midship region; for regions between the fore end and the midship region, \( p_{\text{min}} \) is to be determined by linear interpolation.

For ships of restricted area of navigation the value of \( p_{\text{min}} \) may be reduced by multiplying by the factor \( \varphi \), obtained from Table 3.1.3.5.

2.6.3.2 For weather decks intended to carry deck cargo (except timber and coke), the design pressure is to be taken equal to the cargo pressure \( p_c \) determined by Formula (1.3.4.1). For weather decks intended to carry timber and coke, the value of \( h \) in Formula (1.3.4.1) is to be taken equal to 0.7 times the stowage height of timber and coke on deck.

For lower decks and platforms, the design pressure should be taken according to 1.3.4.1. For decks where cargo is suspended from beams or deck longitudinals, the design pressure value is to be suitably increased.

For decks and platforms intended for the crew, passengers and equipment, the design pressure is to be determined by Formula (1.3.4.1) while the product \( h p_{c, g} \) is not to be less than 3.5 kPa.

For platforms in the machinery space, the minimum design pressure should be 18 kPa.

Watertight lower decks and platforms are to be additionally calculated using the test loads, in kPa, as follows:

\[ p = 7.5 h_{c} \]

where \( h_{c} \) = vertical distance, in m, from deck (platform) plating to air pipe top.

2.6.3.3 The design pressure on the structures of decks and platforms forming boundaries of compartments intended for the carriage of liquids is to be determined in accordance with 1.3.4.2.

2.6.4 scantlings of deck members.

2.6.4.1 Thickness of deck plating:

1. The thickness of strength deck plating outside the line of hatch openings, taking deck longitudinals into account, is to be that necessary to give the hull section modulus for strength deck, as required by 1.4.6.

The adopted thickness of strength deck plating within midship region is to be in accordance with the requirements for buckling strength (see 1.6.5).
.2 The plating thickness for decks and platforms is not to be less than determined by Formula (1.6.4.4) taking:
\[
m = 15.8;
\]
\[
p = \text{as defined in 2.6.3};
\]
for strength deck
\[
k_a = 0.3k_D \leq 0.6 \text{ in the midship region for } L \geq 65 \text{ m}
\]
and transverse framing system:
\[
k_D = \text{as determined by Formula (2.2.4.1)};
\]
\[
k_a = 0.6 \text{ in the midship region for } L = 12 \text{ m}
\]
and the deck is transverse framing system.

Where \(12 < L < 65 \text{ m}\), \(k_a\) is to be determined by linear interpolation taking \(k_a = 0.45\) for \(L = 65 \text{ m}\);

\[
k_a = 0.6 \text{ in the midship region for longitudinal framing system};
\]
\[
k_a = 0.7 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.}
\]

For regions between the midship region and the above portions of ship’s ends, \(k_a\) is to be determined by linear interpolation;

for the second continuous deck situated above \(0.75D\) from the base line
\[
k_a = 0.65k_D \leq 0.8 \text{ in the midship region for } L \geq 65 \text{ m}
\]
and transverse framing system:
\[
k_D = \text{as determined by Formula (2.2.4.1)};
\]
\[
k_a = 0.8 \text{ in the midship region for } L = 12 \text{ m}
\]
and transverse framing system.

Where \(12 < L < 65 \text{ m}\), \(k_a\) is to be determined by linear interpolation taking \(k_a = 0.73\) for \(L = 65 \text{ m}\);

\[
k_a = 0.8 \text{ in the midship region for longitudinal framing system};
\]
\[
k_a = 0.9 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.}
\]

For regions between the midship region and the above portions of ship’s ends, \(k_a\) is to be determined by linear interpolation;

for other lower decks and platforms, \(k_a = 0.9\).

.3 If the machinery space is located aft, the plating thickness and the scantlings of deck longitudinals, at the poop (aft deckhouse) front are to be maintained abaft the poop (deckhouse) front for a length of at least the width of machinery casing opening.

If the distance from the fore edge of casing opening to the poop (deckhouse) front is less than the width of the opening, additional strengthening of deck may be required in this region.

.4 If the thickness of strength deck plating is taken less than the side plating thickness, a deck stringer plate is to be provided. The width \(b\), in mm, of the strength deck stringer plate is not to be less than:
\[
b = 5L + 800 \leq 1800, \quad (2.6.4.1.4)
\]
and the thickness of stringer plate is not to be less than that of side shell plating.

.5 The thickness \(s_{\text{min}}\) in mm, of deck plating and platforms is not to be less than:

for upper deck between the ship’s side and line of large openings (tank decks of tankers) in the midship region
\[
s_{\text{min}} = (4 + 0.05L)\sqrt{\eta} \text{ for } L < 100 \text{ m};
\]
\[
s_{\text{min}} = (7 + 0.02L)\sqrt{\eta} \text{ for } L \geq 100 \text{ m};
\]

for the third deck and other lower decks and platforms
\[
s_{\text{min}} = (5 + 0.01L)\sqrt{\eta};
\]
where \(\eta\) is as defined in 1.1.4.3.

Where \(L > 300 \text{ m}\), \(L\) is to be taken equal to 300 m. Where the adopted spacing is less than the standard one (see 1.1.3) for ships of unrestricted area of navigation and limited area of navigation I, the minimum deck plating and platform thickness may be reduced in proportion to the ratio of adopted spacing to the standard spacing, but not more than by 10 per cent. In any case, the minimum thickness is not to be less than 5.5 mm.

In way of compartments intended for the carriage of liquids, the thickness of plating and deck structural members (including perforated members) is not to be less than required by 3.5.4 for tankers and not less than determined by Formula (2.7.4.1-2) for other ship types.

2.6.4.2 The section modulus of deck longitudinals is not to be less than determined according to 1.6.4.1 and 1.6.4.2 taking:
\[
p = \text{as defined in 2.6.3};
\]
\[
m = 12;
\]
for weather deck
\[
k_a = 0.45k_D \leq 0.65 \text{ in the midship region};
\]
\[
k_a = 0.65 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.}
\]

For regions between the midship region and the above portions of ship’s ends, \(k_a\) is to be determined by linear interpolation;

for other decks
\[
k_a = 0.75;
\]
\[
k_D = \text{is to be determined by Formula (2.2.4.1)}.
\]

2.6.4.3 When the decks are framed transversely, the scantlings of beams are to satisfy the following requirements:

.1 The section modulus of beams is not to be less than that determined from 1.6.4.1 taking:
\[
p = \text{as defined in 2.6.3};
\]
\[ m = 10; \]
\[ k_s = 0.65. \]

The inertia moment \( i_b \), in cm\(^4\), of weather deck beams in the midship region of ships 65 m and greater in length is to be determined on the basis of a buckling strength calculation of deck girdling using beam models in accordance with 1.6.5.

For beams having two or more intermediate rigid supports, the required inertia moment may be determined, alternatively to the grillage calculation, by the following formula:

\[ i_b = 6.33(s/a)\frac{1}{3}l^2 \varphi \chi \times 10^{-3} \quad (2.6.4.3.2) \]

where \( l \) = beam span, in m, between supports;
\( \varphi = 1 \) where \( \sigma_c \leq 0.5R_{u,c} \);
\( \varphi = 4 \frac{\sigma_c}{R_{u,c}} (1 - \frac{\sigma_c}{R_{u,c}}) \) where \( \sigma_c > 0.5R_{u,c} \);
\( \chi = \lambda^2 (4 - 1.5\lambda^2) \);
\( \lambda = \frac{4 \sigma_c}{\varphi (a/s)^3} \), but not more than 1;
\( \sigma_c \) = compressive stresses as determined according to 1.6.5.1;
\( s \) = actual deck plating thickness, in mm.

### 2.6.4.4 The scantlings of deck framing members

such as deck transverses, deck girders, hatch coamings and hatch end beams, are to be determined on the basis of deck grillage calculation using beam models, except for cases mentioned under 2.6.4.5 — 2.6.4.8. Design loads should be chosen in accordance with 2.6.3. Where pillars are fitted, the interaction between deck grillage and upper and/or lower structures should be considered with regard for the arrangement of pillars.

Permissible stress factors should be taken as follows:

- **strength deck**
  - for deck girders and hatch side coamings which are arranged in line with the deck girders
    \[ k_s = 0.35k_p \leq 0.65 \]
    in the midship region for \( L \geq 65 \) m;
  - \( k_p \) is to be determined by Formula (2.2.4.1);
  - \( k_s = 0.65 \) in the midship region for \( L = 12 \) m.

Where \( 12 < L < 65 \) m, \( k_s \) is to be determined by linear interpolation taking \( k_s = 0.5 \) for \( L = 65 \) m;

\( k_s = 0.65 \) at the ends of the ship within 0.1\( L \) from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, \( k_s \) is to be determined by linear interpolation;

- for deck transverses and half beams, hatch coamings, which are not arranged in line with the deck girders and hatch end beams
  \[ k_s = 0.65; \]
- for deep members, which are calculated using the shear stresses
  \[ k_s = 0.65; \]

for deep members of other decks and platforms
\[ k_s = k_s = 0.7. \]

The deep members of weather deck in the midship region are also to comply with the requirements of 2.6.4.9.

### 2.6.4.5 In tankers with two effective longitudinal bulkheads and with no deck girders, and where longitudinal system of framing is adopted, the scantlings of deep members in the centre tank are to comply with the following requirements:

1. The section modulus of deck transverse is not to be less than determined according to 1.6.4.1 and 1.6.4.2, the sectional area of deck transverse web, excluding openings, is not to be less than determined from 1.6.4.3 taking:

\[ p = \text{as defined in 2.6.3}; \]
\[ k_s \] and \( k_s = \) as determined according to 2.6.4.4;
\[ l = B_1; \] \( (B_1 = \) breadth, in m, of centre tank);\n\[ m = m_{b,t}; \]
\[ N_{\max} = 0.7n_{b,s}p; \]
\( m_{b,t} \) and \( n_{b,s} \) are to be determined from Table 2.3.4.2.2 depending upon the parameter \( \mu \) and the number of deck transverses within the tank:

\[ \mu = \frac{p}{\sqrt{L_i/B_i}}; \]
\[ \alpha = \frac{W_{d,t}}{W_{w,p}}. \]

where \( L_i = \) tank length, in m;
\( W_{d,t} = \) section modulus of deck transverse complying with the present requirements;
\( W_{w,p} = \) section modulus of wash plate complying with the present requirements.

The value of the parameter \( \alpha \) is optional, but not to be greater than 0.6; the value of the parameter \( \mu \) should not exceed 1.5.

The deck transverse section modulus is not to be less than \( \alpha W_{w,p} \).

2. The section modulus of wash plate is not to be less than stipulated under 1.6.4.1 and 1.6.4.2, the sectional area of wash plate web, excluding openings, is not to be less than stipulated under 1.6.4.3 taking:

\[ p = \text{as defined in 2.6.3}; \]
\[ k_s \] and \( k_s = \) as determined for deck girders in accordance with 2.6.4.4;
\[ l = L_i; \]
\[ a = \text{distance, in m, between the wash plate and longitudinal bulkhead}; \]
\[ m = m_{c,g}; \]
\[ N_{\max} = 0.7n_{c,g}p; \]
\( m_{c,g} \) and \( n_{c,g} \) are to be obtained from Table 2.3.4.2.2 depending upon the parameter \( \mu \) and the number of deck transverses within the tank; \( \mu \) is to be determined in accordance with 2.6.4.5.1.

Besides, the section modulus of wash plate should not be less than \( W_{d,t}/\alpha \) where \( W_{d,t} \) is the deck transverse section modulus complying with the requirements of 2.6.4.5.1; \( \alpha \) should be determined in accordance with 2.6.4.5.1.
Along the free edge, the wash plate is to be strengthened with a face plate the sectional area of which is not to be less than that of the deck transverse face plate.

2.6.4.6 The deck transverses of tankers having a single longitudinal bulkhead, tankers with two longitudinal bulkheads and no deck girders or strengthened longitudinals (in wing tanks only), as well as deep half beams, deep beams and hatch end coamings of dry cargo ships, which may be considered as members with rigid supports should have a section modulus not less than stipulated under 1.6.4.1 and 1.6.4.2 and a web sectional area, excluding openings, not less than stipulated under 1.6.4.3 taking:

\[ p = \text{as defined in 2.6.3}; \]
\[ k_x \text{ and } k_z = \text{as defined in 2.6.4.4}; \]
\[ m = 10; \]
\[ N_{max} = 0.5pal. \]

2.6.4.7 Deck girders and hatch side coamings are to satisfy the following requirements:

.1 Deck girders and hatch side coamings which may be considered as members with rigid supports should have a section modulus not less than determined in accordance with 1.6.4.1 and 1.6.4.2, and a web sectional area, excluding openings, not less than stipulated under 1.6.4.3 taking:

\[ p = \text{as defined in 2.6.3}; \]
\[ k_x \text{ and } k_z = \text{as defined in 2.6.4.4}; \]
\[ N_{max} = 0.5pal; \]
\[ m = 10 \text{ for intercostal deck girders and hatch side coamings}; \]
\[ m = 12 \text{ for continuous deck girders and hatch side coamings when determining the section modulus at supporting section taking into account the bracket, if any, included in this section}; \]
\[ m = 18 \text{ for continuous deck girders and hatch side coamings when determining the section modulus in the span of a deck girder, hatch side coaming.} \]

.2 For ships less than 30 m in length, the deck girder web thickness need not be taken greater than the deck plating thickness, and the hatch coaming web thickness is to be 1 mm greater than the thickness of deck plating.

.3 If the side coamings of strength deck hatches terminate in brackets, the length \( l_b \), in m, of these brackets on the deck should be:

\[ l_b \geq 0.75h_0 \text{ at } R_{EH} \leq 315 \text{ MPa}; \]
\[ l_b \geq 1.5h_0 \text{ at } R_{EH} = 390 \text{ MPa} \]

where \( h_0 \) = height of coaming above deck, in m.

For the intermediate values of \( R_{EH} \), the bracket length is to be determined by linear interpolation.

.4 If containers or other cargo are stowed on cargo hatch covers, the scantlings of stiffeners for vertical coaming plates are to be so chosen as to consider both the horizontal and vertical components of inertia forces acting upon the stiffeners in the event of rolling.

2.6.4.8 If deck deep member can be considered separately from others, its section modulus is not to be less than stipulated under 1.6.4.1 and 1.6.4.2 using the design loads and factor \( k_x \) determined from 2.6.4.4 and with \( m = 10 \).

The sectional area of such member is not to be less than determined by Formula (1.6.4.3) taking:
\[ k_x = \text{as stipulated under 2.6.4.4; } \]
\[ N_{max} = 0.5pal; \]
\[ p = \text{as defined in 2.6.3.} \]

2.6.4.9 In the midship region of a ship 65 m and greater in length, the deep member scantlings of the weather deck are to comply with the buckling strength requirements of 1.6.5, the buckling strength values to be determined by calculation of the deck grillage using beam models.

Where deck is framed longitudinally and no deck girders are fitted, or deck girders serve as rigid supports for deck transverses, the required moment of inertia \( I \), in cm
\(^4\), of deck transverses may be determined by the following formula, as an alternative to grillage calculation:

\[
I_{d,\tau} = 0.76(l/c)^3 \frac{l}{a_1} \frac{1}{\varphi \chi} \frac{1}{\sigma_c}
\]

where \( l = \text{span of deck transverse between supports, in m;} \)
\( c = \text{distance, in m, between deck transverses;} \)
\( a_1 = \text{spacing of deck longitudinals, in m;} \)
\( l = \text{actual inertia moment, in cm}^4, \text{ of deck longitudinal provided with a face plate;} \)
\( \varphi = 1 \text{ where } 1.15 \sigma_c \leq 0.5R_{EH}; \)
\( \varphi = 4.6(1-1.15 \sigma_c/R_{EH}) \text{ where } 1.15 \sigma_c > 0.5R_{EH}; \)
\( \chi = \text{is determined by Formula (2.6.4.3) taking } \lambda = 1.15 \frac{\sigma_c}{\sigma_{cr}}; \)
\( \sigma_c = \text{compressive stress as defined in 1.6.5.1; } \)
\( \sigma_{cr} = \text{actual Euler stresses in deck longitudinals, determined in accordance with 1.6.5.4.} \]

2.6.5 Special requirements.

2.6.5.1 The requirements for hatch openings as given below apply to single hatches whose scantlings do not exceed those stipulated under 2.6.1.1.

The openings are supposed to be arranged in the fore-and-aft direction with their greater side. Otherwise, the corner design of openings will be subject to special consideration by the Register.

.1 For the strength deck within 0.6L amidships, if \( L \geq 65 \text{ m, and } 0.5L, \text{ if } 40 \leq L < 65 \text{ m, the corner radii of openings in cargo hatches and engine and boiler casings are to comply with the following requirements:} \)

when the corners are rounded along the circumferential arc with a radius \( r \), in m, \n\[
r \geq 0.1ab, \quad (2.6.5.1-1)\]
when the corners are rounded along the elliptical arc with the ratio of the length of longitudinal half-axis $d_1$, in m, to the length of transverse half-axis $c_1$, in m, being equal to 2,

$$c_1 \geq 0.07ab_1 \quad (2.6.5.1-2)$$

where $a=1$, if the corners of openings are not reinforced by thickened insert plates;

$a=0.7$, if the corners of openings are reinforced by thickened insert plates;

$b_1 = c$ when $c \leq c_0$, for adjacent edges of successive openings;

$b_1 = b$ when $c > c_0$, for adjacent edges of successive openings and in all other cases;

$c$ = distance, in m, between adjacent edges of successive openings (length of landing between openings);

$b$ = breadth, in m, of opening;

$$c_0 = B / (h/B - 1);$$

$l$ = length of opening, in m.

The size of thickened insert plates by which the corners of openings are reinforced should be in compliance with Fig. 2.6.5.1.1 or with the requirements of 2.6.5.1.5 where $r$ is to be determined by Formula (2.6.5.1-1) if the rounding is made along the circumferential arc; $r = c_1$ for the transverse dimensions of the insert plate, and $r = d_1$ for its longitudinal dimensions if the rounding is made along the elliptical arc, and $c_1$ is to be determined by Formula (2.6.5.1-2).

Fig. 2.6.5.1.1

.2 For the strength deck outside the area indicated in 2.6.5.1.1 and for the second continuous deck situated above 0.75D from the base line, the corner radii of openings, as required by 2.6.5.1.1, may, in accordance with 1.1.3, be reduced by half in the midship region. The minimum radius is not to be taken less than 0.2 m.

For other regions, other decks and platforms, as well as for ships less than 40 m in length, the minimum corner radius of openings in cargo hatches and engine and boiler casings may be taken equal to 0.15 m.

.3 At corners of openings in the cargo hatches of decks (irrespective of their location over the length and depth of the hull) exposed to low temperatures, the radii of curvature should comply with the requirements for similar structures of the strength deck, situated in the midship region (see 2.6.5.1.1).

.4 In the area A (see Fig. 2.6.5.1.1), butts of deck plating and coaming plates, butt welds of primary and deep longitudinal members, openings welding of shackles, frames, etc., as well as mounting parts, to deck plating are not permitted.

In the area C (see Fig. 2.6.5.1.1), only small openings generally of a round or elliptical shape with a minimum size not exceeding 20s ($s = $ deck plating thickness, in mm) are permitted. Penetration of welds to longitudinal edges of openings should be avoided as far as practicable.

If the deck plating is terminated at a hatch coaming (or engine casing) and welded thereto, full penetration welds are to be used. Where the deck plating extends inside a hatch coaming, the free edges of plating are to be smooth within the hatch and free of weld attachments.

If the hatch side coaming terminates in a bracket, the bracket the is not to coincide with the butt joint of the deck plating.

.5 If the last cross-sectional area of deck is to be compensated in way of an isolated opening, reinforcement should be applied as shown in Fig. 2.6.5.1.5. The value of factor $k$ is to be selected proceeding from the relationship between the deck plating thickness $s$, insert plate thickness $s_1$ and opening width $b$, but is not to be taken less than $k = 0.35s/s_1$.

Fig. 2.6.5.1.5

.6 The deck plating thickness between transverse edges of adjacent successive openings in cargo hatches and engine casings (see 2.6.5.1.1) within area except for the transverse dimensions of rounding is not to be less than stipulated under 2.6.4.2.

The thickness $s_{min}$ is permitted in way of transverse edges of isolated openings in the area shown in Fig. 2.6.5.1.6.

If longitudinal system of framing is adopted, the deck plating between hatch end coamings should be additionally strengthened by fitting of transverse intercostal stiffeners at every frame.

.7 Single openings in the strength deck and in the second continuous deck situated above 0.75D from the base line, in areas within the midship region, as
open decks of superstructures within 0.25L from the forward perpendicular is not to be less than:

\[ s = 0.01d_c + 5 \]  \hspace{1cm} (2.6.5.2)

where \( d_c \) = internal diameter or length of the greater side of a coaming section, in mm.

The thickness \( s \) is not to be less than 7 mm, but it need not be greater than 10 mm.

In ships of restricted areas of navigation II, II C1, III C1 and III, less than 24 m in length, the thickness \( s \), in mm, of ventilator coamings is not to be less than:

\[ s = 0.01d_c + 4 \]

or

\[ s = s_d + 1, \]

whichever is the greater,

where \( d \) = internal diameter or length of the greater side of a coaming section, in mm; \( s_d \) = thickness of deck plating, in mm.

The thickness of coamings on decks of the first tier superstructures situated outside 0.25L from the forward perpendicular may be reduced by 10 per cent as compared to that required for coamings on freeboard deck and raised quarter deck.

Where the thickness of deck plating is less than 10 mm, a welded insert or doubling plate should be fitted in way of the coaming, having a thickness equal to at least 10 mm, length and breadth not less than twice the diameter or twice the length of the greater side of the coaming section.

In case of an efficient connection of the coaming to the deck framing, fitting of welded insert or doubling plate is not required.

Where the height of a ventilator coaming is greater than 0.9 m and the coaming is not supported by adjacent hull structures, brackets are to be fitted to attach the coaming to the deck.

The height of ventilator coamings should be determined in accordance with 7.8 of Part III "Equipment, Arrangements and Outfit".

The structure of companionway and skylight coamings are to have strength equivalent to that of cargo hatches, whereas the thickness of the coamings is not to be taken less than 7 mm, but need not exceed the thickness of deck plating in way of the coaming.

2.7 BULKHEADS, PROPELLER SHAFT TUNNEL

2.7.1 General and definitions.

2.7.1.1 Requirements are given in this Chapter for various types of bulkheads, propeller shaft tunnel and cofferdams. Requirements for cofferdam bulkheads are to be found under 3.3.
2.7.1.2 Definitions.

**Tight bulkhead** is a bulkhead proof against water and other liquids.

**Cofferdam bulkhead** is a bulkhead having two parallel tight platings, either strengthened with vertical or horizontal stiffeners or not, which are connected to each other by plate structures perpendicular to the platings: vertical structures (diaphragms) and/or horizontal structures (platforms). If no diaphragms and platforms are fitted, the structure should be considered as two bulkheads bounding the cofferdam.

**Water-tight (emergency) bulkhead** is a bulkhead restricting the flow of water through ship spaces in the case of emergency.

**Tank/cargo tank bulkhead** is a bulkhead bounding a ballast, fuel or other tank, as well as a cargo tank of tanker.

**Wash bulkhead** is a bulkhead with openings, fitted inside a compartment in order to reduce impact pressure due to the movement of liquid therein.

**Partial bulkhead** is a bulkhead fitted in a compartment or part thereof, which is to ensure additional support for deck structures.

2.7.1.3 The total number of transverse watertight bulkheads, including fore and after peak bulkheads, is not to be less than specified in Table 2.7.1.3. These requirements apply to cargo ships only and are minimum.

1With after peak bulkhead forming after boundary of the machinery space.

All the transverse watertight bulkheads located between fore and after peak bulkheads are generally to be carried to the freeboard deck.

2.7.1.4 Peak and machinery space bulkheads, shaft tunnels are also to comply with the requirements of 1.1.6.1 or 1.1.6.2.

2.7.1.5 Compartments intended for the carriage of liquid cargoes and ballast, for which \( l > 0.13L \) and/or \( h > 0.6B \) (\( l \) and \( b \) are the length and breadth, in m, of a compartment, as measured in the middle of its height), are subject to special consideration by the Register.

2.7.2 Construction.

2.7.2.1 Tight bulkheads may be either plane or corrugated. Wash bulkheads with openings should be plane bulkheads.

For the construction of longitudinal tight bulkheads, as well as for the tight bulkheads of log and depth sounder wells, escape trunks, propeller shaft tunnel, etc., the same requirements apply as for transverse tight bulkheads.

In bulkheads, watertight steps and recesses are permitted.

In tankers, the longitudinal bulkheads should be tight throughout the cargo tank region (including pump rooms and cofferdams) with the exception of the third bulkhead at the centreline which may be constructed as a wash bulkhead.

At intersections of longitudinal and transverse bulkheads, structural continuity of longitudinal bulkheads should be ensured. The termination of longitudinal bulkheads should be smooth.

Partial bulkheads should be plane bulkheads.

2.7.2.2 In corrugated longitudinal bulkheads, the corrugations should generally be arranged horizontally, while in transverse bulkheads the arrangement of corrugations may be both horizontal and vertical.

Plane bulkheads are to be strengthened by vertical or horizontal stiffeners. The vertical and horizontal stiffeners of plane bulkhead as well as the vertical and horizontal corrugations of corrugated bulkheads may be supported by horizontal girders or vertical webs respectively.

The horizontal girders and vertical webs are to be stiffened in accordance with the requirements of 1.7.3.

Partial bulkheads are to be strengthened by vertical webs.

2.7.2.3 The end attachments of bulkhead framing members should comply with the following requirements:

1 The ends of vertical webs and horizontal stiffeners of bulkheads are generally to be attached by brackets complying with the requirements of 1.7.2.2. Bracket attachments are required for the ends of main framing of fo'repeak bulkhead below the freeboard deck.

2 If transverse system of framing is adopted, the brackets by which the vertical webs of transverse
bulkheads are attached to deck plating and inner bottom plating (bottom plating) should be carried to the beam or floor nearest to the bulkhead and welded thereto.

Where transverse framing system is adopted, the brackets by which the horizontal stiffeners of bulkheads are attached to the side or other bulkhead should be carried to the frame or vertical stiffener nearest to the bulkhead and welded thereto.

3 When the vertical stiffeners of bulkheads are cut at decks, platforms or horizontal girders and no brackets are fitted, the stiffener ends should be welded to deck or platform plating, to horizontal girder web, or sniped at ends.

4 The end attachments of vertical webs and horizontal girders should comply with the requirements of 1.7.2.3.

Where there are no horizontal girders on longitudinal bulkheads and/or side stringers at the level of the horizontal girder brackets of transverse bulkheads, the brackets should be carried to the nearest vertical web on longitudinal bulkhead and/or the nearest frame and welded thereto.

If the vertical web on a transverse bulkhead is not in line with the centre girder or side girder, a bracket should be fitted in the double bottom under the bracket by which the lower end of the vertical web is attached.

2.7.2.4 The attachments of corrugated bulkheads should comply with the following requirements:

1 Where a horizontally corrugated bulkhead is attached to deck and bottom (inner bottom) or a vertically corrugated bulkhead is attached to ship’s sides and longitudinal bulkheads, provision is to be made for flat transition areas whose structure, thickness and stiffening should be in compliance with the requirements for plane bulkheads.

2 Attachment of corrugation ends should be effected by welding them directly to the inner bottom plating (bottom plating), side plating, deck plating, etc. In so doing, attention should be given to eliminating hard spots (see 1.7.1.4) in the above structures.

3 Requirements for the attachments of corrugated bulkheads in bulk carriers are given in 3.3.2.

2.7.3 Bulkhead loading.

2.7.3.1 The design pressure \( p \), in kPa, on watertight bulkhead structures and propeller shaft tunnel is to be taken equal to:

\[
p = \alpha z_b \quad (2.7.3.1)
\]

where \( \alpha = 10 \) for forepeak bulkhead structures;

\( \alpha = 7.5 \) elsewhere;

\( z_b \) = distance, in m, as measured at the centreline, from the point of design load application to its upper level; the upper load level is: the bulkhead deck for watertight bulkheads and propeller shaft tunnel, the upper edge of forepeak bulkhead for the forepeak bulkhead.

If partial watertight bulkheads are fitted on the bulkhead deck in line with the watertight bulkheads or in close vicinity to them, \( z_b \) is to be measured to the upper edge of the watertight partial bulkheads.

In any case, the design pressure is to be not less than 12 kPa for watertight bulkhead structures and not less than 16 kPa for forepeak bulkhead structures.

2.7.3.2 The design pressure on the bulkheads of tanks, cargo tanks and water ballast holds is to be determined in accordance with 1.3.4.2.

The design pressure on the wash bulkheads and plates should be determined by Formulae (1.3.4.2-6) and (1.3.4.2-7), but is not to be less than \( p_{\text{min}} = 25 \text{ kPa} \).

The design pressure on bulkheads bounding heavy bulk cargo holds is to be determined in accordance with 1.3.4.3.

2.7.4 Scantlings of bulkhead members.

2.7.4.1 The thickness of bulkhead plating is to be not less than determined by Formula (1.6.4.4) taking:

\[
p = \text{as defined in 2.7.3;}
\]

\( m = 15.8; \)

for the longitudinal bulkheads of tankers 65 m or greater in length, with transverse framing in the midship region

\[
k_a = 0.55 k_y \leq 0.8 \text{ at the level of base line;}
\]

\( k_y \) is to be determined by Formula (2.2.4.1);

\[
k_a = 0.55 k_y \leq 0.8 \text{ at the upper deck level;}
\]

\( k_y \) is to be determined by Formula (2.2.4.1);

\[
k_a = 0.8 \text{ in way of } (0.4 - 0.5) L \text{ from the base line.}
\]

For intermediate regions over the ship’s depth, \( k_a \) is to be determined by linear interpolation;

\[
k_a = 0.8 \text{ for } L = 12 \text{ m.}
\]

Where \( 12 < L < 65 \text{ m, } k_a \) is to be determined by linear interpolation taking \( k_a = 0.68 \) for \( L = 65 \text{ m at the level of base line and upper deck;}

\[
k_a = 0.9 \text{ at the ends of the ship within } 0.1L \text{ from the fore or after perpendicular.}
\]

For regions between the midship region and the above portions of ship’s ends, \( k_a \) is to be determined by linear interpolation;

\[
k_a = 0.9 \text{ for other bulkheads.}
\]

In ships of 50 m in length, the thickness of watertight bulkhead plating may be reduced by 0.5 mm, and in ships of 40 m in length or below, by 1 mm. For intermediate ship lengths, the reduction in thickness is to be determined by linear interpolation.

In tankers, the thickness of top and bottom strakes of longitudinal bulkheads is to comply with the requirements for side plating, as given in 2.2.4, with regard for the liquid cargo pressure.

The plating thickness \( s_{\text{min}} \), in mm, of watertight bulkheads and bulkheads of lubricating oil tanks is not to be less than:

\[
s_{\text{min}} = 4 + 0.02 L. \quad (2.7.4.1-1)
\]

Where \( L > 150 \text{ m, } L \) is to be taken equal to 150 m.
The thickness of bottom plates of bulkheads is to exceed the above value by 1 mm, but is not to be less than 6 mm.

For tank bulkheads (except lubricating oil tanks), the thickness $s_{\text{min}}$, in mm, of plating, face plates and webs of framing members is not to be less than:

$$s_{\text{min}} = 5 + 0.015L;$$

(2.7.4.1-2)

$$6.0 \leq s_{\text{min}} \leq 7.5 \text{ mm.}$$

In tankers, the minimum bulkhead plating thickness in way of cargo and ballast tanks is not to be less than that required by 3.5.4.

Bulkhead plating may have a thickness not exceeding that of relevant shell plating strakes and deck plating, where the spans and yield stress values are identical. The same applies to the thickness relationship of bulkhead bottom plating and inner bottom plating (bottom plating).

The breadth of top and bottom strakes of bulkheads is to be determined in accordance with 2.7.5.1.

Where sternstubs penetrate through bulkhead plating, the thickness of the latter should be doubled.

The thickness of corrugated bulkheads is to be determined in accordance with 1.6.4.5 with regard for the requirements for the section moduli of vertical and horizontal stiffeners, as specified in 2.7.4.2.

### 2.7.4.2

The section modulus of vertical and horizontal stiffeners of bulkheads is not to be less than stipulated under 1.6.4.1 and 1.6.4.2 taking:

- $p$ as defined in 2.7.3;
- $m$ as obtained from Table 2.7.4.2;

<table>
<thead>
<tr>

<td>18</td>
</tr>
<tr>
<td>within intermediate supporting section, where stiffener is continuous through supporting structure$^2$</td>
<td>12</td>
</tr>
<tr>
<td>Horizontal stiffeners</td>
<td>12</td>
</tr>
</tbody>
</table>

$^1$Additionally, strength in the supporting section is to be verified, considering the bracket as part of the section, with $m = 12$.

$^2$With regard for a bracket, if fitted, in the supporting section.

For horizontal stiffeners of longitudinal bulkheads fitted in the midship region of tankers 65 m and greater in length

- $k_a = 0.55k_B \leq 0.75$ at the level of base line;
- $k_B$ is to be determined by Formula (2.2.4.1);
- $k_a = 0.55k_B \leq 0.75$ at the upper deck level;
- $k_B$ is to be determined by Formula (2.2.4.1);
- $k_a = 0.75$ within $(0.4 - 0.5D$ from the base line.

For intermediate regions over the ship’s depth, $k_a$ is to be determined by linear interpolation:

- $k_a = 0.75$ for $L = 12$ m;
- Where $12 < L < 65$ m, $k_a$ is to be determined by linear interpolation, taking $k_a = 0.65$ for $L = 65$ m at the base line and upper deck level.
- $k_a = 0.75$ at the ends of the ship within $0.1L$ from the fore or after perpendicular.

For regions between the midship region and the above portions of ship’s ends, $k_a$ is to be determined by linear interpolation:

- $k_a = 0.75$ for other girders of bulkhead framing.
- $m = 10$ for corrugations;
- $m = 13$ for vertical corrugations of bulkheads whose top and bottom ends are attached to deck and bottom or to inner bottom by transverse members of rectangular or trapezoidal section and by supports of trapezoidal section complying with 3.3, respectively.

Horizontal stiffeners of longitudinal bulkheads fitted at a distance of $0.15D$ from deck and bottom are to comply with the buckling strength requirements of 1.6.5.

For tank bulkheads (except lubricating oil tanks), the thickness of member webs and face plates as well as of their stiffening brackets is not to be less than required by Formula (2.7.4.1-2), and for the bulkheads of tankers in way of cargo and ballast tanks it is not to be less than stipulated under 3.5.4.

### 2.7.4.3

Bulkhead vertical webs and horizontal girders are to satisfy the following requirements:

1. The section modulus and web sectional area, excluding openings, of the vertical webs of bulkheads whose structure does not include horizontal girders, and of the horizontal girders of bulkheads whose structure does not include vertical webs, are not to be less than stipulated under 1.6.4.1 — 1.6.4.3 taking:

   $$N_{\text{max}} = n/p;$$

- $p$ as defined in 2.7.3;
- $m$ and $n$ for the longitudinal bulkheads of tankers are to be determined from Table 2.7.4.3-1 depending upon the number of cross ties fitted in wing tanks between deep members of bulkhead and of ship’s side; for other bulkheads for which vertical webs are provided, but horizontal girders are omitted, or vice versa, the values of $m$ and $n$ should be obtained from Table 2.7.4.3-2;
- $l$ = span, including the brackets, in m;
\( k_e \) is determined for horizontal girders of longitudinal bulkheads in tankers in the same way as for the horizontal stiffeners of those bulkheads in accordance with 2.7.4.2; for other webs and girders, \( k_e = 0.75; \)
\( k_i = 0.75. \)

\( \sigma_s = 200\eta. \)

The moment of inertia and sectional area of the stiffener on the basis of which the Euler stresses therein are determined should be calculated with regard for the face plate of partial bulkhead plating equal in width to half the distance between the stiffeners.

3 If the partial bulkhead takes up the load directly from cargo, the scantlings of its members are to comply with the requirements for hold bulkheads with regard for the particular cargo.

2.7.4.6 The scantlings of shaft tunnel members, its recess included, and those of the tight bulkheads of log and depth sounder wells, escape trunks, etc. should comply with the requirements for the scantlings of watertight bulkhead members.

If the shaft tunnel passes through a compartment intended for the carriage of liquid cargo or ballast, the scantlings of its members should comply with the requirements for the scantlings of the members of tight bulkheads bounding the compartment.

If the top plating is well curved, the thickness may be reduced by 10 per cent.

Under hatchways the top plating thickness is to be increased by 2 mm.

2.7.5 Special requirements.

2.7.5.1 The breadth of the bottom strake of bulkhead, as measured from inner bottom plating, or, where double bottom is omitted, from the bottom shell, should be not less than 0.9 m for ships of 40 m and greater in length, and not less than 0.4 m for ships of 12 m in length. For intermediate ship lengths, the breadth of this strake is to be determined by linear interpolation. If the double bottom extends to the bulkhead on one side only, the bottom strake of bulkhead plating is to extend for at least 0.3 m above the inner bottom plating.
In the boiler room, the bottom strake of the bulkhead is to extend for at least 0.6 m above the flooring.

The upper edge of bottom strake of transverse bulkheads in the cargo tanks of tankers should be at least 100 mm above the upper toes of brackets of bottom longitudinals. The top and bottom strake breadth of longitudinal bulkhead plating is not to be less than 0.1D, but need not exceed 1.8 m.

2.7.5.2 Cofferdams and the bulkheads forming their boundaries are to comply with the following requirements:

1. Unless expressly provided otherwise in the other Parts of the Rules, the breadth of vertical cofferdams stipulated under 2.1.12 and 2.4.7 of Part VI "Fire Protection", and under 13.7.5, 14.5.2, 17.3 of Part VIII "Systems and Piping" should be equal to one spacing, but not less than 0.6 m, and the height of horizontal cofferdams should not be less than 0.7 m.

In any case, cofferdam dimensions should be so selected as to make the cofferdams accessible for inspection and repair.

Instead of cofferdams, cofferdam bulkheads may be fitted in accordance with 3.3 unless expressly provided otherwise by the Rules.

2. Cofferdams adjoining cargo tanks and fuel tanks must be watertight. Bulkheads separating cofferdams from tanks are to comply with the requirements for the bulkheads of those tanks.

The bulkheads of cofferdams filled with water are to comply with the requirements for tank bulkheads.

The bulkheads of cofferdams which are to ensure tightness, but which are not filled with water, should comply with the requirements for watertight bulkheads.

The bulkheads of cofferdams which are non-tight should comply with the requirements for partial bulkheads as stipulated under 2.7.4.5, except the requirement for vertical webs supporting deck transverses and hatch end beams. They may have openings provided the corners of the openings are rounded and the edges are suitably reinforced. Such openings are not generally to be arranged in the top and bottom strakes of longitudinal bulkheads.

2.8 FORE AND AFTER ENDS

2.8.1 General and symbols.

2.8.1.1 Requirements are given in this Chapter for the following structures: fore peak and bulb (if any), bottom within 0.25L aft of the fore perpendicular, side within 0.15L aft of the fore perpendicular, structures located aft of the after peak bulkhead, as well as strengthening of bottom and side forward in the region of impact pressure.

It is assumed in this Chapter that the upper boundary of the fore and after peak is formed by a tight deck or platform arranged directly above the summer load waterline.

2.8.1.2 Symbols:

\(d_f\) = minimum design draught, in m, in way of forward perpendicular;

\(\alpha_s\) = angle, in deg., between a vertical and the straight line connecting the intersection points of summer load waterline and weather deck with the ship’s side at a cross section within 0.05L from the forward perpendicular (Fig.2.8.1.2-1);

\(\beta_s\) = angle, in deg., between a tangent to the waterline at vertical mid-distance between the summer load waterline and weather deck on forward perpendicular, and a line parallel to the centreline at a cross section within 0.05L from the forward perpendicular (Fig.2.8.1.2-2).

2.8.2 Construction.

2.8.2.1 The following framing systems are adopted at ends:

transverse system of framing for bottom in peaks;

transverse or longitudinal system of framing for other structures.

2.8.2.2 Fore peak floors are to be fitted at every frame. Their height is not to be less than stipulated under 2.4.4.1, but need not exceed 2.25 m, and the thickness is not to be less than required by Formula (2.4.4.3-2) at \(k = 1\) and \(a = 0.6\) m; however, they need
not be thicker than the bottom shell plating in this region. Floor webs should be strengthened with vertical stiffeners to be spaced not more than 0.6 m apart.

Floor face plates are to have a thickness not less than the floor thickness and a breadth required by 1.7.3.1.

At the centreline an intercostal side girder with a face plate is to be fitted as an extension of centre girder in way of the holds. The height and thickness of girder plates as well as the thickness and width of girder face plate are to be equal to those of the floors.

Where the webs of the girder cannot be arranged, the floor face plates are to be interconnected at the centreline by an angle, tee section, etc. the flanges of which have the same width and thickness as the floor face plates.

2.8.2.3 If transverse system of framing is adopted in the fore peak side, the side stringers should be fitted at least up to the deck directly above the summer load waterline. Side stringers must be so fitted that the distance measured vertically between them does not, in general, exceed 2 m.

Side stringers should be supported by panting beams fitted at alternate frames and should, where possible, be supported at the centreline by a longitudinal bulkhead.

The free edge of the side stringers is to be stiffened by a face plate having a thickness not less than that of a stringer web and a breadth in accordance with 1.7.3.1. At every frame, the stringer web is to be stiffened by brackets having the side dimensions not less than half the stringer web height, and where panting beams are fitted, these are to be not less than required by 1.7.2.2. The thickness of brackets is not to be less than that of the stringer web.

Instead of panting beams, the side stringers may be supported by web frames spaced not more than 3 m apart.

It is recommended that non-tight platforms be fitted instead of side stringers with panting beams or web frames. In this case, the distance between the platforms may be increased to 2.5 m. The beams of non-tight platforms should be fitted at every frame.

If in the structure with panting beams or web frames the distance from the base line to the nearest deck or platform exceeds 9 m, a non-tight platform is to be fitted at the middle of this length, in which the total area of openings is not to exceed 10 per cent of its area.

With longitudinally framed fore peak side, the spacing of web frames is not to exceed 2.4 m. Deck transverses are to be fitted in way of the web frames passage through or attachment to decks and platforms.

Floors without web frames fitted in line with them are to be attached to the nearest side longitudinals by brackets.

2.8.2.4 The bulb must be strengthened by platforms spaced not more than 2 m apart. Beams of the platform are to be fitted at every frame.

If the length of the bulb forward of the forward perpendicular exceeds 0.03L, a non-tight bulkhead should be fitted at the centreline, with stiffeners arranged at every frame.

If the length of the bulb is less than 0.03L, the bulb may be strengthened by a girder fitted at the centre line in continuation of the centre girder.

The construction of the fore end should provide for the anchor to be lowered freely past the bulb with the ship listed 5 degrees either side.

In way of eventual touching of the bulb, the shell plating thickness is to be increased and intermediate frames fitted.

2.8.2.5 In ships with single bottom, the bottom structure in way of the fore end outside the fore peak is to comply with the requirements of 2.3.2, 2.3.4 and those given below:

1. If transverse system of framing is adopted, the spacing of side girders, as well as the distance from the centre girder or the ship’s side to a side girder, is not to exceed 1.1 m within 0.25L from the forward perpendicular.
If longitudinal system of framing is adopted and minimum draught is less than 0.035L in way of the forward perpendicular, in cargo tanks of tankers an additional transverse with a face plate along its free edge should be fitted midway between the bottom transverses. The depth of this transverse should not be less than that of bottom longitudinals.

2 Forward of cargo tanks:

If transverse system of framing is adopted, intercostal side girders with face plates along their free edges are to be fitted in continuation of every second bottom longitudinal, extending forward as far as practicable. The depth and thickness of the side girder webs, as well as the scantlings of the face plates, should be taken the same as for the floors.

If longitudinal system of framing is adopted, the spacing of floors should not exceed 2.8 m. An intercostal side girder having the same scantlings as the floors is to be fitted on either side of the ship between the centre girder and longitudinal bulkhead.

2.8.2.6 In way of the fore end, the double bottom structure outside the fore peak is to comply with the requirements of 2.4.2 and those given below.

Within 0.25L from the forward perpendicular the distance between side girders is not to exceed 2.2 m. If transverse system of framing is adopted, in this region half-height side girders should be fitted additionally and welded to the bottom and floors. The distance between side girders and half-height girders is not to exceed 1.1 m. These half-height girders are to be extended as far forward as practicable, whereas their free edges are to be reinforced with flanges or face plates.

If longitudinal system of framing is adopted, the floors are to be strengthened with stiffeners in line with each half-height side girder and each bottom longitudinal.

In ships greater than 80 m in length with a minimum draught less than 0.025L in way of the forward perpendicular, the edges of openings in floor, side girder and centre girder webs are to be stiffened within 0.25L from the forward perpendicular.

2.8.2.7 If transverse framing system is adopted, intercostal side stringers should be fitted within 0.15L from the forward perpendicular, outside the fore peak, at the level of the fore peak side stringers. The depth and thickness of a stringer plate are to be equal to those of the frame. The intercostal brackets fitted as stringer plates should be welded to the webs of frames at both ends and to the shell plating. On the free edge of a stringer, a face plate is to be fitted with the thickness not less than that of the web and the breadth in accordance with 1.7.3.1.

The intercostal side stringer may be of the same profile as the frames.

The stringer face plate (flange) should not be welded to the face plate of frame.

Intercostal stringers are to be attached to the bulkheads by brackets.

The face plates (flanges) of intercostal stringers may be omitted where the spacing of frames does not exceed their double depth. In this case, their thickness s, in mm, is not to be less than \( s = \frac{l}{4s + h} \) or \( s = 0.05h \), whichever is the greater, where \( l \) is the length of the free edge of stringer between frames, in mm; \( h \) is the stringer depth, in mm.

In ships having the characteristic \( (\delta/\sqrt{T}) > 1.5 \) or a large bow flare, provision is to be made for web frames and side stringers supported thereby. The spacing of web frames is not to exceed 5 frame spaces.

Where longitudinal framing is adopted in the ship’s side forward outside the fore peak, the spacing of side transverses is not to exceed 3 m. In the holds of any ship, as well as in ’tween decks and superstructures of ships with the characteristic \( (\delta/\sqrt{T}) > 1.5 \) or with a large bow flare, provision is to be made for a vertical intercostal member having the same scantlings as side longitudinals, to be fitted between side transverses. The structure of the member should be similar to that of the intercostal side stringers required by transverse framing system. The intercostal member can terminate at the upper and lower side longitudinals of the hold, ’tween decks and superstructure. Every second side longitudinal must be attached to the side transverses by brackets extended to the frame face plate.

2.8.2.8 Within 0.1L from the forward perpendicular, the span of weather deck transverses is not to exceed 3 m, and the deck girder span is not to exceed 3.6 m.

Within 0.2L from the forward perpendicular, the section modulus of weather deck transverses is not to be less than required for deck girders with equal spans and spacing of members.

2.8.2.9 The structure located aft of the after peak bulkhead must be sufficiently rigid in the vertical and horizontal plane. For this purpose, fitting of additional longitudinal bulkheads or platforms, thickening of deck plating and shell plating, as well as connection of bottom and upper deck longi-tudinals with pillars or struts may be required. If the stern overhang is large or the after peak width exceeds 20 m at any section, fitting of additional longitudinal non-tight bulkheads is recommended port or starboard.

Where there is a flat of the bottom, additional strengthening may be required to take up the loads due to impact pressure.

2.8.2.10 Floors in the after peak are to comply with the requirements of 2.8.2.2.

In single screw ships, the floors should be extended above the sterntube, but in any case to a height of not less than 0.8 m. If this is impracticable, tie plates with face plates on both edges should be
fitted transversely at every frame above the sterntube. The thickness of the tie plates is not to be less than that of the floor. Tie plate exceeding 1.5 m in length is to be provided with a stiffener fitted in the middle of its length.

Floors with flanged edges are not permitted.

In ships greater than 200 m in length, floors are to be extended to the platform located above the sterntube. Longitudinally, the floors should be stiffened with brackets fitted at the centreline and, if practicable, supporting the floor for a full depth. Brackets above the sterntube are necessary. The brackets should be carried to the propeller post. They need not be fitted where a wash plate is located above the floors, with its lower edge extending at least 0.8 m below the face plates of the floors.

The opening in floors for the sterntube is to be reinforced with face plate along the edges. Below the sterntube, the openings should be reinforced with face plates or stiffeners.

2.8.2.11 If transverse framing is adopted in the after peak side, pouting beams and side stringers, beam knees, frame to side stringer attachments, arrangement and structure of web frames and non-tight platforms are to comply with the requirements of 2.8.2.3. The vertical distance between side stringers is not to exceed 2.5 m, and the frame span, as measured on the side plating, is not to exceed 3.5 m.

In 'twin- and multi-screw ships having a cruiser or transom stern, the distance between stringers, as measured on the side plating, is not to exceed 2 m, with one of the stringers being fitted in way of the top edge of propeller shaft bossing or in line with the shaft bracket. Where web frames are fitted, their spacing is not to exceed 2.4 m.

If longitudinal framing is adopted in the after peak side, relevant requirements of 2.8.2.3 are to be complied with.

2.8.2.12 The ends of after peak members (including deck, platform and bulkhead framing), as well as the ends of horizontal and, where practicable, vertical stiffeners of floors are to be secured (see 1.7.1.4).

The face plates of the after peak floors and deck transverses are to be sniped in way of their attachments to longitudinal bulkheads. Bulkhead stiffeners should be attached to the floor face plates by brackets fitted on either side of the bulkhead.

This also applies to deck girder and side girder attachments to transverse bulkheads.

2.8.2.13 The spacing of ordinary and bevel frames may be the same as in the midship region, but is not to exceed 750 mm. A side girder of the same depth as that of floors is to be fitted at the centreline. In case of transom stern and/or flat of the bottom, the side girders are to be spaced not more than 2 m apart.

In full cruiser sterns and where the frame span from the upper edge of floors to the nearest deck exceeds 2.5 m, additional strengthening is to be provided by means of web frames and a side stringer.

2.8.2.14 If peaks are used as tanks, fitting of a wash bulkhead is recommended at the centreline.

2.8.3 Loading on structures at ends.

2.8.3.1 The design pressure on the structures at ends is determined using the design loads specified in 2.2 — 2.7 and the extreme loads specified in 2.8.3.2 and 2.8.3.3.

The scantlings of fore end members subject to impact pressure should be verified by applying extreme loads:

in accordance with 2.8.3.2 for ships greater than 65 m in length with a minimum draught of 0.045L in way of the forward perpendicular;

in accordance with 2.8.3.3 for ships having the characteristic \( (\eta_0/\sqrt{T}) > 1.5 \) or a considerable bow flare.

2.8.3.2 Under the wave impact upon the bottom of the fore end, the extreme values of the design hydrodynamic pressure \( p_{SL} \), in kPa, are to be determined using the formula

\[
p = 5.5C_1C_2\varphi_bB \frac{h_b}{L}(1 - 5d_f/L)(1 - x_1/l_b)/10^3, \quad (2.8.3.2-1)
\]

where \( C_1 = \sqrt{L} \) for \( L \leq 200 \) m;

\[
C_2 = 0.134\varphi_b(1 - 17.1d_f/L)/\sqrt{T};
\]

\( h_b = (0.22 + 1.5C_2)/L \);

for \( \varphi_b \), see 1.1.3;

\( \varphi_b \) as obtained from 1.3.1.5 (\( \varphi_b = 1 \) for ships of unrestricted service);

\( b_c \) = ship breadth, in m, in the considered cross section at the level of 0.04B above the base line, but not greater than 0.8B;

\( x_1 \) = distance, in m, from the considered cross section to the forward perpendicular, but not greater than \( l_b \).

Formula (2.8.3.2.1) is used for derivation of \( p \) values in a number of sections within the portion \( h_b \), from which the maximum value of \( p \) (hereinafter — symbol \( p_{max} \)) and the value of \( x_1 \) (hereinafter — symbol \( x_{max} \)) corresponding to \( p_{max} \) are chosen. The design pressure \( p_{SL} \) (Fig. 2.8.3.2) is determined by the formula

\[
p_{SL} = p_f + (p_f - p) x_1(x_m - 0.05L)
\]

when \( 0 \leq x_1 < x_m - 0.05L \);

\[
p_{SL} = p_m
\]

when \( x_m - 0.05L \leq x_1 \leq x_m + 0.05L \); \( (2.8.3.2-2) \)

\[
p_{SL} = p_m(0.5L - x_1)/(0.45L - x_m)
\]

when \( x_m + 0.05L \leq x_1 \leq 0.5L \)

where \( p_f = 0.5p_{max} \) with bulb;

\( p_f = 0 \) without bulb.

The hydrodynamic pressure as determined by Formula (2.8.3.2-2) is distributed over a height of 0.04B above the base line.
2.8.3.3 Under the wave impact upon the side at the fore end, the extreme values of the design hydrodynamic pressure \( p_{SL} \) in kPa, are to be determined by the formula

\[
p_{SL} = 0.9C_s C_4 L^{2/3}
\]

(2.8.3.3)

where

\[
C_s = 2.2 + 1.5 \tan \gamma;
\]

\[
C_4 = \frac{v_0 (0.6 - 20 L)(1.2 - 20 \beta_x/60) \sin \beta_x + 0.6 \sqrt{T}}{v_0}.
\]

\( \beta_x \) and \( \gamma \) are as defined in 2.8.1.2.

Depthwise the impact pressure is distributed over the part of the side above the ballast waterline, and lengthwise — over the part of the side extending as far aft as the cross section at 0.01\( v_0 L \) from the forward perpendicular and as far forward as the intersection of the upper deck with the stem (see Fig. 2.8.1.2-2).

2.8.4 Scantlings of structural members at ends.

2.8.4.1 The shell plating thickness, scantlings of single bottom and double bottom members and of side framing are to comply with the requirements of 2.2.4, 2.3.4, 2.4.4, 2.5.4 using the service loads given in 2.2, 2.3, 2.4, 2.5. Besides, when determining the scantlings of fore and after peak members, the following requirements are to be satisfied:

1. The section modulus of frames is to be determined by Formulae (1.6.4.1-1) and (1.6.4.1-2) taking:

\[
m = 12;
\]

\( l \) = spacing of side stringers, as measured along the shell plating.

2. Scantlings of panting beams are to comply with the requirements of 2.9.4.1.

3. In calculating the section modulus and cross-sectional area of web frames,

\[
m = 10;
\]

\[
N_{max} = 0.5pal
\]

where \( p \) = design pressure, in kPa, according to 2.5.3;

\( a \) = spacing of web frames, in m;

\( l \) = span of web frame, in m, as measured between the upper edge of floor and the deck (platform) bounding the fore peak (after peak) or the non-tight platform, if any, nearest to the bottom, or between non-tight platforms, the deck and non-tight platform less the height of deck transverse of the relevant deck (platform).

4. Plating thickness and framing of non-tight platform are to satisfy the requirements of 2.6.4 for platforms at ends. When determining the design load by Formula (1.3.4.1), the product \( hp \cdot g \) is not to be less than 3.5 kPa.

The thickness of non-tight platform plating, in mm, is not to be less than:

\[
s_{min} = (5 + 0.02L) \sqrt{\eta},
\]

but not less than 5 mm.

Where \( L > 300 \) m, \( L \) is to be taken equal to 300 m.

5. If the fore peak (after peak) is used as tanks, the scantlings of their members are also to comply with the requirements for the structural members of tanks.

2.8.4.2 Where exposed to extreme loads to be determined in accordance with 2.8.3.2, the scantlings of bottom framing members at the fore end are to comply with the requirements of 2.2.4, 2.3.4 and 2.4.4, as well as with the following additional requirements:

1. The thickness of shell plating is to be determined by Formula (1.6.4.4) taking:

\[
p = 0.4p_{SL}
\]

(2.8.4.2.1)

where \( p_{SL} \) is as derived from Formula (2.8.3.2-2).

\[
m = 15.8;
\]

\[
k_\sigma = 0.7.
\]

2. The section modulus, in \( \text{cm}^3 \), of a primary member is not to be less than:

\[
W = 0.75 \frac{pd^2}{mk_\sigma m} \alpha_\tau / 10^{3}
\]

where \( p \) = as derived from Formula (2.8.4.2.1);

\[
k_\sigma = 0.65;
\]

\[
m = 16, \text{ if the members are continuous through the webs of supporting structures;}
\]

\[
m = 8, \text{ if the members are cut at supports;}
\]

\[
m = 28, \text{ if the supporting sections of the member are reinforced with brackets on both sides of the supporting structure; the depth and length of brackets are not less than 1.5 of the member depth;}
\]

for \( \alpha_\tau \), see 1.1.5.3.

3. The cross-sectional area, in \( \text{cm}^2 \), of a primary member or of welds by which intercostal members are connected to supporting structures is not to be less than:

\[
f = 5pa \left( \frac{l-0.5a}{k_\tau k_m} + 0.05 \Sigma h_i d_i \right)
\]
The cross-sectional area of a member includes the web area, as well as the portion of the sectional area of shell plating, having a breadth \( b_1 = 3s \) (where \( s \) is the thickness, in mm, of shell plating). If the member is of bulb profile, the whole of its face plate is included in the cross-sectional area. In the case of member of T-section, a portion of its breadth \( b_2 = 3s_{fp} \) is included in the cross-sectional area (where \( s_{fp} \) is the face plate thickness of the member, in mm).

4. The web thickness \( s \), in mm, of floor, side girder and centre girder is not to be less than:

\[
s = 0.75 \frac{pab}{k_s \gamma h} + \Delta s
\]

where \( p \) = as derived from Formula (2.8.4.2.1);
\( k_s = 0.65; \)
\( \Delta s \) = as determined from 1.1.5.1.

2.8.4.3 Where exposed to extreme loads to be determined in accordance with 2.8.3.3, the scantlings of side framing members at the fore end are to comply with the requirements of 2.2.4 and 2.5.4, as well as with the following additional requirements:

1. The thickness of shell plating is to be determined by Formula (1.6.4.4) taking:

\[
p = 0.5p_{SL}
\]  
(2.8.4.3.1)

where \( p_{SL} \) = as derived from Formula (2.8.3.3);

\( m = 15.8; \)
\( k_a = 0.7. \)

2. The section modulus of a primary member is to comply with the requirements of 2.8.4.2.2 using the design load determined by Formula (2.8.4.3.1).

3. The cross-sectional area of a primary member is to comply with the requirements of 2.8.4.2.3 using the design load determined by Formula (2.8.4.3.1).

2.8.4.4 Within the area of the stern counter, the scantlings of frames are to be not less than those of the after peak frames, unless their span exceeds 2.5 m. With a greater span, the frame scantlings should be increased accordingly. The thickness of floors and side girders is not to be less than required by 2.8.4.5.

2.8.4.5 The side stringers of fore and after peaks are to have a web sectional area \( f_w \), in \( \text{cm}^2 \), not less than:

\[
f_w = 12 + 0.45L.
\]

The side stringer width \( b \), in \( \text{m} \), is not to be less than:

\[
b = 0.24 + 0.005L \text{ for } L < 80 \text{ m};
\]

\[
b = 0.4 + 0.003L \text{ for } L > 80 \text{ m}.
\]

The web thickness, in mm, of a side stringer is not to be less than:

\[
s_{min} = (5 + 0.02L)\sqrt{\eta},
\]

but not less than 5 mm.

Where \( L > 300 \text{ m} \), \( L \) is to be taken equal to 300 m.

2.8.4.6 The thickness of shell plating in way of the bulb is not to be less than 0.08\( L \) + 6, but it need not be taken greater than 25 mm. In this case, the shell plating thickness at the lower part of the bulb is not to be less than stipulated under 2.8.4.2.1 for the hull section in way of the forward perpendicular.

2.8.5 Special requirements.

2.8.5.1 Visor-type bow doors.

1. The present requirements apply to the construction of visor-type bow doors which form a component part of the fore end of the ship, being mechanically connected with the side and deck structures and capable of moving in the vertical direction to provide access for motor vehicles and/or other transport means.

2. The thickness of visor-type bow door plating is not to be less than that required by 2.8.4 for the appropriate sections of shell plating.

3. The section modulus of primary members is not to be less than that required by 2.8.4 for the appropriate fore end regions. In this case, the design load, in kPa, is not to be less than:

\[
p_{min} = 0.8(1.5\sigma_0 + 0.6\sqrt{L})^2.
\]  
(2.8.5.1)

The sectional area of member web is not to be less than determined by Formula (1.6.4.3) taking:

\[
N_{max} = 5pal
\]

where \( p \) = design load in accordance with 1.3.2.2 or 2.8.3.3, whichever is the greater, but not less than \( p_{min} \) in kPa, as determined by Formula (2.8.5.1).

\( k_s = 0.7. \)

4. Structural measures are to be taken to ensure rigid attachment of primary members and support members of bow doors.

5. The scantlings of support members are to be obtained by strength calculation using the design loads given in 1.3.2.2 or 2.8.3.3, whichever is the greater, but not less than \( p_{min} \) determined by Formula (2.8.5.1), as well as the permissible stress factors \( k_a = k_s = 0.6. \)

6. The construction of support members is to comply with the requirements of 1.7.3.

2.8.5.2 In ships provided with fixed propeller nozzles, transverse bulkheads or support members
are to be fitted in way of the nozzle attachment to the hull.

2.8.5.3 In hull curvilinear sections (deadrise, flare), it is recommended that the framing be fitted at an angle of approximately 90° to the shell plating.

2.8.5.4 In multi-screw ships, the structural strength and rigidity in way of stern tube, shaft bracket and shaft bossing attachments are subject to special consideration by the Register.

2.9 PILLARS AND PANTING BEAMS

2.9.1 General and symbols.

2.9.1.1 Requirements are given in this Chapter for the scantlings of pillars fitted in the hull, superstructures and deckhouses and for the panting beams in peaks.

2.9.1.2 Symbols:

- \( l \) = length of pillar (panting beam), in m, measured: for the pillar — between the face plate of the deck girder (or the deck transverse, if the latter is supported by the pillar) and the deck plating (or the inner bottom plating); for the panting beam — between the inner edges of the starboard and port frames or from the inner edge of the frame to a strong support at the centerline;
- \( f \) = sectional area of the pillar (panting beam), in \( \text{cm}^2 \);
- \( i \) = the least moment of inertia of the pillar (panting beam), in \( \text{cm}^4 \);
- \( d_0 \) = outer diameter of the pillar, in mm.

2.9.2 Construction.

2.9.2.1 The pillar axes in 'tween deck spaces and holds are generally to be fitted in the same vertical line, the heads and heels of the pillars are to be bracketed.

Where the heel of a tubular pillar with the load \( P < 250 \text{ kN} \) has no brackets, the deck (inner bottom) plating under the heel is to be strengthened with doubling or insert plates (\( P = \) as determined from 2.9.3.1).

The web of a framing member to which the head of a pillar is attached is to be strengthened with brackets to transmit the load to the pillar.

The pillars are to be fitted on plate floors and side girders which are to be strengthened with vertical brackets. Openings in floors and side girders under the pillars are not permitted.

With the load \( P > 250 \text{ kN} \) (\( P = \) as defined in 2.9.3.1), the pillars are to be fitted at the intersection of plate floors and side girders, otherwise the plate floor (side girder) is to be strengthened with vertical brackets attached to the adjacent floors (side girders).

2.9.2.2 The pillars are to be attached at their heads and heels by brackets or other arrangements approved by the Register, in order to effectively transmit the loads to the hull structures below:

- in the holds of ships of ice categories \( \text{LY9}, \text{LY8}, \text{LY7}, \text{LY6}, \text{LY5} \);
- in the tanks under watertight platforms, deckhouses, ends of superstructures, windlasses, winches, capstans, etc.;
- at the fore end of ships with the specified speed \( v_0 > 1.5\sqrt{L} \) or large bow flare.

2.9.3 Design loads.

2.9.3.1 Loading on the pillar \( P \), in kN, is determined by the formula

\[
P = P_{\text{dc}} + \sum (P_{\text{dc}}b_{\text{m}}),
\]

where
- \( P_{\text{dc}} = \) design pressure on the above deck specified in 2.6.3, in kPa;
- \( l_m = \) distance measured along the deck girders between mid-points of their spans, in m;
- \( b_{\text{m}} = \) mean breadth of deck area (including the hatchways in the region concerned) supported by the pillar, in m;
- \( \sum (P_{\text{dc}}b_{\text{m}}) = \) sum of loads from the pillars fitted above, determined having regard to 2.6.3, which may be transmitted to the pillar considered, in kN.

2.9.3.2 Loading on the panting beam \( P \), in kN, is determined by the formula

\[
P = p_a c
\]

where
- \( p_a = p_{\text{dc}} + p_{\text{a}} = \) design pressure on the ship's side in way of installation of the panting beam, determined from 1.3.2.1 and 1.3.2.2, in kPa;
- \( a = \) spacing of frames on which panting beams are fitted, in m;
- \( c = \) half-sum of frame spans measured vertically above and under the beam considered, in m.

2.9.4 Scantlings of pillars and panting beams.

2.9.4.1 The sectional area of pillars and panting beams \( f \), in \( \text{cm}^2 \), is not to be less than determined by the iterative method according to the formula

\[
f = 10kP/\sigma_{\text{cr}} + Af
\]

where
- \( P = \) as determined in accordance with 2.9.3;
- \( k = 2 = \) buckling strength margin;
- \( \sigma_{\text{cr}} = \) critical stress according to 1.6.5.3 at Euler stress determined by the formula

\[
\sigma_{\text{cr}} = \frac{206l}{R^2};
\]

\( Af = \) wear allowances, in \( \text{cm}^2 \), determined by the following formulae:

- for tubular pillars
  \( Af = 0.03d_0 A_k \);
- for box-shaped pillars
  \( Af = 0.12\ell k A_k \),

where \( \Sigma h \) = perimeter length of cross section, in cm;
- for built-up pillars and panting beams (I-beams, made of channels, etc.);

\[
Af = 0.05\Sigma h A_k.
\]

2.9.4.2 The wall thickness \( s \), in mm, of tubular pillars is not to be taken less than:

\[
s = (d_0/50) + 3.5.
\]
The wall thickness of built-up pillars (box-shaped, made of channels or I-beams, etc.) \( s \), in mm, is not to be less than:

\[
s = \frac{h_p}{50} \quad (2.9.4.2-2)
\]

where \( h_p \) — width of the pillar wall, in mm.

The wall thickness of a pillar, in general, is not to be taken less than 6 mm.

In small ships the thickness of the pillar walls may, on agreement with the Register, be reduced to 5 mm, provided the required sectional area of the pillar is maintained.

### 2.10 STEMS, STERNFRAMES, KEELS, RUDDER HORN, PROPELLER SHAFT BRACKETS, FIXED NOZZLES OF PROPELLERS

#### 2.10.1 General.

**2.10.1.1** Requirements are given in this Chapter for the construction and scantlings of the stem, sternframe (rudder post, propeller post), solepiece of the sternframe, rudder horn of semi-spade rudders, propeller shaft brackets, keel, fixed nozzles of propellers.

**2.10.2 Construction.**

**2.10.2.1** It is recommended to use a bar or plate type welded stem. The lower part of the stem is to be efficiently connected to the bar or plate keel and, whenever possible, to the centre girder.

The welded stem plates are to be stiffened with transverse brackets. Arrangement of transverse brackets of the stem should, as far as possible, be consistent with the hull framing. Transverse brackets stiffening the stem plate are fitted not more than 1 m apart below and not more than 1.5 m above the summer load line. The brackets are to overlap the joints of the stem with the shell plating and are to be extended and welded to the nearest frames.

The brackets which cannot be extended to the framing, except for the brackets in way of ice belt in ships with ice categories, should have their rear edge made along a smooth curve.

In case where the radius of curvature of the stem is sufficiently large, it is recommended to fit a centerline girder with a face plate.

**2.10.2.2** The construction of sternframe of a single screw ship is to comply with the following requirements:

**1.** The sternframe is to have such dimensions as to provide the clearances between sternframe and propeller, and between propeller and rudder (Fig. 2.10.2.2) not less than indicated in Table 2.10.2.2.

**2.** The solepiece should be made with a smooth rise in the aft direction.

**3.** The propeller post is to be provided with transverse brackets in the case of welded sternframe and webs in the case of cast sternframe. The brackets and webs are to be spaced at least 1 m apart; their arrangement is to be consistent with the hull framing.

**4.** The sternframe is to be efficiently attached to the hull.

The lower part of the sternframe should be extended forward from the propeller post and should be attached by its brackets (webs) to at least three floors in ships with a length \( L > 120 \) m and at least two floors in ships with a length \( L \leq 120 \) m. In small ships the sternframe may be attached to one floor only.

The rudder post is to extend over the counter to a height sufficient for its attachment to the transom floor.

In ships of 80 m and above and in ships with cruiser stern, the propeller post is also to be extended upwards to a distance sufficient for its attachment to the additional transom floor.

The thickness of transom floor and additional transom floor should be increased as compared to that of the floors in the after peak. In general, the above floors are to be extended to the nearest deck or platform.

**2.10.2.3** The sternframe in twin screw ships is to comply with the requirements for the sternframe in single screw ships, as specified in 2.10.2.2. The lower part of the sternframe to be extended forward, may be attached to at least two main floors.

**2.10.2.4** The sternframe of triple screw ships is to comply with the requirements for the sternframe of single screw ships, as specified in 2.10.2.2 and 2.10.4.2.

<td>0.08( R_p )</td>
<td>200 — 250</td>
</tr>
</tbody>
</table>

\( R_p \) — radius of propeller, in mm.
2.10.2.5 The rudder horn of semi-spade rudder is to be efficiently connected to the respective floors of the after peak and its centreline wash bulkhead. The welded rudder horn is to be provided inside with transverse brackets; its main supporting structures are to be extended to the nearest deck or platform; the thickness of the floors to which the rudder horn is connected is to be increased as compared to that of the floors in the after peak.

2.10.2.6 The struts of two-strut shaft brackets are to form an angle of approximately 90° to each other. Their axes are to intersect at the axis of the propeller shaft.

The construction of propeller shaft brackets with struts arranged at an angle less than 80° and greater than 100°, additional strengthening of the hull within the region of shaft brackets are subject to special consideration by the Register.

The propeller shaft brackets are to be so arranged in relation to the ship’s hull that the clearance between the blade tip and the ship’s hull is as large as possible and, but not less than 25 per cent of the propeller diameter.

2.10.2.7 The outer and inner plating of propeller nozzle is to be strengthened by stiffeners whose arrangement and size as well as connection with outer and inner plating of the propeller nozzle are to be determined according to 2.4.2.2 of Part III "Equipment, Arrangements and Outfit".

In general, the transverse web plates are to be arranged in line with the floors of the after peak.

In way of attachment of the nozzle to the hull smooth transition from the nozzle to the ship’s hull is to be provided. The bottom part of the nozzle is to be connected to the hull. If the propeller nozzle is attached to the hull by shaft brackets, provision is to be made for an efficient connection of the brackets with the framing in the aft region of the hull and the framing inside the nozzle. The construction of shaft brackets is to satisfy the requirements of 2.10.2.6. Drain plugs of non-corrosive material are to be fitted in the top and bottom parts of outer plating.

2.10.3 Design loading.

Design loading for the structures of the solepiece and rudder horn of semi-spade rudders is taken equal to the reaction force of lower support of the rudder $R_4$ according to 2.2.4.12 of Part III "Equipment, Arrangements and Outfit". In Formulae (2.2.4.7-2) — (2.2.4.7-4) the coefficient $x_4$ should be taken equal to zero.

2.10.4 Scantlings of stem, sternframe, rudder horn and propeller shaft brackets, bar keel and fixed nozzle of propeller.

2.10.4.1 The stem is to satisfy the following requirements:

1. The sectional area $f$, in cm$^2$, of a bar stem from the keel to the summer load waterline is not to be less than:

$$f = 1.3L - 4.$$  

The sectional area may be reduced for ships of restricted areas of navigation:

II and II CII — by 10 per cent;

III CII and III — by 20 per cent.

Above the summer load waterline the sectional area may be gradually reduced to 70 per cent of the area stated above.

2. The plate thickness $s$, in mm, of welded stem is not to be less than:

$$s = (0.085L + 5.5)\sqrt{\eta},$$

but not less than 7 mm

where $\eta = $ as determined from 1.1.4.3.

Where $L > 220$ m, $L$ is to be taken equal to 200 m.

The plate thickness of the stem may be reduced for ships of restricted areas of navigation:

II and II CII — by 5 per cent;

III CII and III — by 10 per cent.

The plate thickness of the stem above the summer load waterline may be gradually reduced to that of shell plates adjoining the stem.

The thickness and width of the stem plates in way of attachment to the plate keel is not to be less than the thickness and width of the latter.

When the distance between the brackets strengthening the stem is reduced by 0.5 m, as compared to that required by 2.10.2.1, the reduction of plate thickness of stem by 20 per cent may be permitted. If the reduction of the distance between the brackets is less than 0.5 m, the permissible reduction of plate thickness is to be determined by linear interpolation.

3. The thickness of brackets strengthening the stem is not to be less than that of shell plating adjoining the stem.

The thickness of web and face plate of the girder stiffening the stem at the centreline is not to be less than that of the brackets.

2.10.4.2 The sternframe of a single screw ship is to satisfy the following requirements:

1. The length $l_s$ and width $b_s$, in mm, of rectangular solid propeller post section, from the keel to the counter, are not to be less than:

$$l_s = 1.30L + 95; \quad b_s = 1.60L + 20 \quad \text{for } L < 120 \text{ m};$$

$$l_s = 1.15L + 110; \quad b_s = 0.675L + 130 \quad \text{for } L \geq 120 \text{ m}.$$  

The scantlings of the propeller post may be reduced for ships of restricted areas of navigation:

II and II CII — by 5 per cent;

III CII and III — by 10 per cent.

Above the counter the sectional area of sternframe may be gradually reduced. And nowhere its sectional area is to be less than 40 per cent of the required area of the propeller post, corresponding to the scantlings stated above.
.2 The scantlings of the propeller post cross section of a cast sternframe with the rudder having top and bottom supports are to be established in accordance with Fig. 2.10.4.2-1 depending on the value \( s_0 \), in mm, determined by the following formulae:

\[
s_0 = 0.1L + 4.4 \quad \text{for} \quad L \leq 200 \text{ m}; \\
s_0 = 0.06L + 12.4 \quad \text{for} \quad L > 200 \text{ m}.
\]

The thickness of webs is to be at least 50 per cent greater than that of the shell plating adjoining the sternframe.

![Diagram of sternframe and propeller post](image)

Fig.2.10.4.2-1

1 — web; 2 — adjoining plate of shell;

\( s_1 = 1.5s_0, \quad s_2 = 2.5s_0, \quad s_3 = 3.5s_0; \)

\( l_2 = 1.2L + 135 \text{ mm for} \quad L < 200 \text{ m}; \\
l_2 = 1.4L + 235 \text{ mm for} \quad L \geq 200 \text{ m}; \\
r — \text{cast radius.}
\]

.3 The scantlings of the propeller post cross section of a welded sternframe with the rudder having top and bottom supports are to be established according to Fig.2.10.4.2-2 where \( s_0 \) is to be determined in accordance with 2.10.4.2.2. The thickness of transverse brackets is to be at least 20 per cent greater than that of the shell plating adjoining the sternframe.

Welded propeller post of other construction may be used, provided that its strength is equivalent to that of the above-mentioned construction.

.4 The finished thickness of propeller boss is to be not less than 30 per cent of the shaft diameter.

.5 The section modulus \( W_s \), in cm\(^2\), of the solepiece about the vertical axis is not to be less than:

\[
W_s = 8\alpha R_s x_s \eta.
\]  

(2.10.4.2-1)

The section modulus \( W_{r,p} \), in cm\(^2\), of the rudder post about the horizontal longitudinal axis is not to be less than:

\[
W_{r,p} = 8(1-\alpha) R_s x_s \eta.
\]  

(2.10.4.2-2)

where \( \alpha = 0.85 \) if there is a rudder post;

\( \alpha = 1 \) if there is no rudder post or a bolted rudder post is fitted;

\( R_s \) as determined according to 2.10.3;

\( x_s \) — distance from the solepiece section concerned to the centre of the rudder stock (\( x_s \) should not be taken less than 0.5\( l_s \) and more than \( l_s \));

\( l_s \) — span of the solepiece, measured from the centre of the rudder stock to the beginning of rounding of the propeller post, in m;

\( l_{r,p} \) — span of the rudder post, measured vertically from the mid-thickness of solepiece at the centre of the rudder stock to the beginning of rounding in the upper part of the rudder post, in m;

\( \eta \) as determined according to 1.1.4.3.

The section modulus of the solepiece about the horizontal transverse axis is not to be less than 0.5\( W_s \) where \( W_s \) is to be determined by Formula (2.10.4.2-1). The section modulus of the rudder post about the horizontal transverse axis is not to be less than 0.5\( W_{r,p} \) where \( W_{r,p} \) is to be determined by Formula (2.10.4.2-2).

.6 The scantlings of the sternframe structural members may be determined on the basis of direct strength calculation taking the permissible stress factor \( k_p = 0.55 \) and external loads according to Chapter 2.2 of Part III “Equipment, Arrangements and Outfit”.

2.10.4.3 The scantlings of the sternframe of twin screw ships are to satisfy requirements for the scantlings of propeller post in single screw ships as given in 2.10.4.2 with the following amendments:

.1 the section width of the sternframe of a solid rectangular cross section may be reduced by 50 per cent as compared with that required by 2.10.4.2.1;

.2 the scantlings of the cast or welded sternframe may be reduced as compared with those required by 2.10.4.2.2 and 2.10.4.2.3 respectively, so that their section moduli about the horizontal longitudinal and
transverse axes, are reduced by not more than 50 per cent. The thickness of the sternframe wall is to be at least 7 mm.

2.10.4.4 For semi-spade rudders with one gudgeon upon the horn, the section modulus, in cm³, of the rudder horn about the horizontal longitudinal axis is not to be less than:

\[ W = 12 R_s z \eta \]

where \( R_s \) as defined in to 2.10.3;

\( z \) — vertical distance for the mid-thickness of the horn gudgeon to the section concerned, in m (\( z \) is not to be taken less than 0.5 \( l_b \) and more than \( 0.7 l_b \));

\( l_b \) — horn span measured vertically from the mid-thickness of the horn gudgeon to the point of intersection of the horn axis with shell plating, in m;

\( \eta \) — as determined according to 1.1.4.3.

Where the rudder horn is welded of plates, the thickness of the plates, in all cases, is to be at least 7 mm.

The scantlings of the rudder horn may be determined on the basis of direct strength calculation taking the permissible stress factor \( k_o = 0.35 \) and external loads according to Chapter 2.2 of Part III "Equipment, Arrangements and Outfit".

2.10.4.5 The sectional area of either strut of two-strut shaft brackets is to be equal to not less than 60 per cent of the propeller shaft section in the bracket plane, the strut thickness — to not less than 45 per cent, and the boss thickness — to not less than 35 per cent of the propeller shaft diameter. The length of the boss is to be in accordance with 5.5.1 of Part VII "Machinery Installations".

The strength of the welded shaft brackets is not to be less than that specified above. The plate thickness is not to be less than 7 mm.

The weld area of rivets attaching each strut to the hull is not to be less than 25 per cent of the propeller shaft sectional area. Where the struts are attached by means of flanges, the thickness of the latter is to be not less than 25 per cent of the propeller shaft diameter.

2.10.4.6 The height \( h_b \) and width \( b_s \), in mm, of the bar keel cross section are not to be less than:

\[ h_b = 1.3L + 100; \]
\[ b_s = 0.7L + 8 \text{ for } L < 60 \text{ m}; \]
\[ b_s = 0.4L + 26 \text{ for } L \geq 60 \text{ m}. \]

The height and width of the bar keel cross section may be reduced for ships of restricted areas of navigation:

II and II CII — by 5 per cent;

III CII and III — by 10 per cent.

2.10.4.7 The thickness of outer and inner plating of fixed propeller nozzle is to comply with the requirements of 2.4.2 of Part III "Equipment, Arrangements and Outfit" taking the following into consideration:

- width of middle belt of inner plating is to be not less than the distance from 0.03 \( D_o \), forward of the propeller blade tips and 0.07 \( D_o \) aft of the propeller blade tips where \( D_o \) is the internal diameter of propeller nozzle;
- thickness of forward part of the inner and outer plating is to be not less than required for side shell plating (see 2.2.4.1 for transverse framing system).

The width of attachment is to be at least 0.15 \( D_o \).

The cross-sectional area of the joint is to be not less than required by 2.10.4.2.5 for the solepiece. If the solepiece serves as support of the rudder, the connection of the nozzle to the solepiece is subject to special consideration by the Register.

For twin screw ships when the propeller nozzle is not attached to the hull at its bottom part, the width of attachment at the top part is to be not less than 0.3 \( D_o \).

If the propeller nozzle is attached to the hull by shaft brackets, their strength is to comply with the requirements of 2.10.4.5.

In way of attachment of the nozzle to the hull the thickness of framing members is not to be less than required by Formula (2.4.2.2-2) of Part III "Equipment, Arrangements and Outfit".

2.11 SEATINGS OF MACHINERY AND BOILERS

2.11.1 General.

2.11.1.1 Requirements are given in this Chapter for the construction and dimensions of the seatings intended for main machinery and boilers, deck machinery, fishing installations, cargo handling gear, auxiliary machinery, etc.

2.11.1.2 The requirements laid down in this Chapter are minimum. Requirements concerning construction and dimensions of structural components of a seating, which are contained in the technical documentation of the machinery, unit or device to be installed on the seating concerned, are also to be complied with.

2.11.2 Construction of seatings.

2.11.2.1 The construction of seatings is to satisfy the following requirements:

1. The seating is to be of substantial construction to ensure efficient attachment of machinery, gear or device and transmission of forces to the hull framing, which is to be sufficiently strong. If necessary, the framing may be strengthened.

2. The seating is to be so constructed that the resonance vibration of the seating as a whole and of its structural components can be avoided under all specified running conditions.

3. Where the seating in ships with a length \( L > 65 \text{ m} \) is installed on the continuous longitudinals
of strength deck and double bottom (bottom) within 0.5L amidships, the height of the vertical plates of the seating at the ends is to be gradually reduced. If the length of the vertical plate is more than six times its height, the vertical plate and its top plate are to be made of the same steel grade as the deck or double bottom (bottom) structural member on which it is installed. The structural components of the seating are not to terminate at the unsupported portions of plating. Attachment of the seating to the upper edge of sheerstrake is subject to special consideration by the Register.

4 The seating is to be so designed that the plating beneath is accessible for inspection. Measures should be taken to prevent water from accumulating under the seating.

In particular cases agreed with the Register, a hermetic construction of the seating is permitted, the inner space of the seating being filled with some chemically neutral material with good adhesion properties.

2.11.2.2 In general, a seating of main machinery and boilers should comprise two vertical plates (girder webs) (for medium-speed and high power engines — four vertical plates (two — either side of the engine)) and horizontal face plates (top plates) to which the machinery (boiler) is to be attached directly. The vertical plates are to be strengthened with brackets (knees) having face plates (flanges) along the free edges.

Where the seating comprises four vertical plates, the top plate is attached to two vertical plates fitted on one side of the machinery; the outer plates are to have openings to provide access into the seating. In the case of medium-speed engines, such openings are not to extend to the top plate. The outer plates may be made sloped.

All the vertical plates are to be fitted in line with the main or additional side girders.

2.11.2.3 Machinery and equipment may be installed on shell plating of the hull, tight bulkheads, decks and platforms (including tank bulkheads and crown), inner bottom and shaft-tunnel platings on condition they are attached to the framing members and stiffeners (see 1.7.1.4), or on cantilevers connected to framing members or stiffeners.

Attachment of small-sized machinery and equipment directly to the above-mentioned structure with the help of welded pads is not permitted.

2.11.3 Dimensions of structures of seatings.

2.11.3.1 The thickness $s$, in mm, of structural components of a seating of main machinery or boiler is not to be less than:

$$s = k_0 \sqrt[3]{Q} + k_1$$

where $Q$ — mass of machinery (boiler) in working condition, in t; $k_0$ — factor given in Table 2.11.3.1-1; $k_1$ — factor given in Table 2.11.3.1-2.

### Table 2.11.3.1-1

2.11.3.2 The thickness $s$, in mm, of structural components of a seating of main internal combustion engine is not to be less than:

$$s = k_2 \sqrt[3]{N} + k_3,$$

but not less than required by 2.11.3.1.

where $N$ — specified power of the engine, in kW; $k_2, k_3$ — factors given in Table 2.11.3.2.

2.12 SUPERSTRUCTURES, DECKHOUSES AND QUARTER DECKS

2.12.1 General provisions, definitions and symbols.

2.12.1.1 Requirements are given in this Chapter for short and long bridges extending from side to side of the ship as well as to short bridges which do not extend to the sides of the ship, forecastle, poop, long forecastle and poop extending to ship’s sides, short deckhouses and quarter decks.
The applicability of the requirements contained in this Chapter to long superstructures not extending from side to side of the ship as well as to long deckhouses are to be specially agreed with the Register.

2.12.1.2 Definitions.

Ends of superstructures and deckhouses are the ends of the length measured from the end bulkheads, in m:

\[ l_e = \frac{1}{5}(B_s/2 + h). \]  

(2.12.1.2-1)

Long bridge is a superstructure having a length not less than:

\[ l_1 = 2l_e, \]  

but not less than 0,15L.  

(2.12.1.2-2)

Short bridge is any bridge which is not a long bridge. Superstructures of ships less than 65 m in length are considered as short superstructures. Long deckhouse is a deckhouse of a length not less than that determined by Formula (2.12.1.2), but not less than 0,20L, having no expansion or sliding joints.

Short deckhouse is any deckhouse which is not a long deckhouse. Deckhouses of ships less than 65 m in length are considered as short deckhouses. Long forecastle (poop) is a forecastle (poop) having a length not less than:

\[ l_t = 0,1L + l_e, \]  

in ships of 65 m and greater in length.

Quarter deck is the after part of upper deck stepped up to a portion of 'tween deck height.

Transition area of quarter deck is an area measured from the forward edge of break to the after edge of upper deck plating and extending below the quarter deck.

2.12.1.3 Symbols:

- \( B_s \) = breadth of superstructure deck measured at its mid-length, excluding the breadth of openings of cargo hatches, machinery casings, if any, in m;
- \( h \) = height of the first tier of superstructure or deckhouse, in m;
- \( l_t \) = length of superstructure (deckhouse) measured between the end bulkheads; the length of forecastle (poop) measured from the fore or after perpendicular to the end bulkhead of the forecastle (poop), in m;
- \( B_s \) = ship’s breadth at the level of the upper deck at the section considered, in m;
- \( b \) = breadth of the deckhouse, in m.

2.12.2 Construction.

2.12.2.1 For the first tier of long bridge outside the end portions, long forecastle (poop) outside the end portion, the requirements of 2.6 for the upper deck and the requirements of 2.2 and 2.5 for the ship’s side in way of the upper 'tween deck space are to be complied with.

2.12.2.2 For the bottom strake of side plating and longitudinal bulkhead plating of short bridge, the ends of 1st tier long bridges and long forecastle (poop), the bottom strake of side plating of steel short deckhouses and the ends of steel long deckhouses fitted on the strength deck, grade of steel and yield stress are to be the same as required for the strength deck in this region. The width of the bottom strake is not to be less than 0,5h.

2.12.2.3 Whenever practicable, the end bulkheads of superstructures and deckhouses are to be situated in line with the hull transverse bulkheads or as close to the latter as possible.

Web frames or vertical webs, bulkheads or partial bulkheads are to be fitted in superstructures and deckhouses in such a way as to be in line with girder webs or bulkheads of hull structures located below. The vertical webs of end bulkheads are to be fitted in line with the vertical webs of hull bulkheads.

2.12.2.4 The lower ends of vertical stiffeners of the end bulkheads of the 1st tier superstructures and deckhouses are to be welded to the deck. The lower ends of side vertical stiffeners of 1st tier houses are to be attached to the deck by brackets.

2.12.2.5 Adequate strengthening is to be provided for the structures of deckhouses and superstructures where launching and recovery appliances for survival craft and rescue boats are fitted.

2.12.3 Design loading.

2.12.3.1 The design loading on the superstructure sides and on the superstructure and deckhouse decks is to satisfy the following requirements:

1. Design pressure on the superstructure sides is determined according to 2.2.3.

2. Design pressure on weather areas of the superstructure and deckhouse decks is to be determined by the formula:

\[ p = 2p_w, \]  

but not less than \( p_{\text{min}} \).

where \( p_w \) = wave load at the deck level according to 1.3.2.2;

\( 2 = 0.9 \) for forecastle deck, long forecastle deck or part of long bridge deck within 0,2L from the fore perpendicular;

\( 2 = 0.8 \) for poop deck, long poop deck or part of long bridge deck within 0,2L from the after perpendicular;

\( 2 = 0.7 \) for short bridge and deckhouse decks, long superstructure and deckhouse decks, long forecastle and poop decks outside the midship region. For areas of long bridge and deckhouse decks, long forecastle and poop decks outside the midship region and outside areas situated at 0.2L from the fore or after perpendicular, \( 2 \) is to be determined by linear interpolation.

For the 1st tier superstructure and deckhouse decks, \( p_{\text{min}} \), in kPa, is to be determined by the following formulae:
for forecastle, long forecastle decks or part of long bridge deck within 0.2L from the fore perpendicular

\[ p_{\text{min}} = 0.1L + 7; \]

for poop, long poop deck or part of long bridge deck within 0.2L from the after perpendicular

\[ p_{\text{min}} = 0.015L + 4 \text{ for } L \leq 80 \text{ m}; \]
\[ p_{\text{min}} = 0.03L + 2.8 \text{ for } L > 80 \text{ m}; \]

for bridge and deckhouse decks, long forecastle and poop decks within the midship region

\[ p_{\text{min}} = 0.015L + 4; \]

for areas of bridge and deckhouse decks, long forecastle and poop decks outside the midship region and outside areas situated at 0.2L from the fore or after perpendicular, \( p_{\text{min}} \) is to be determined by linear interpolation.

For decks of the superstructures and deckhouses of the 2nd and upper tiers,

\[ p_{\text{min}} = 2 \text{ kPa.} \]

For ships greater than 250 m in length, \( p_{\text{min}} \) is determined taking \( L = 250 \text{ m}. \)

For ships of restricted area of navigation, \( p_{\text{min}} \) may be reduced by multiplying by the factor \( \varphi_r \) obtained from Table 1.3.1.5.

2.12.3.2 Pressure on the end bulkheads of superstructures and deckhouses as well as on sides of deckhouses \( p \), in kPa, is determined by the formula

\[ p = 5.1n c_2(k z_0 - z_1) \]  
(2.12.3.2)

where \( n = \) factor determined from Table 2.12.3.2-1; \( c_2 = 0.3 + 0.7b/B_c \), in this case, \( c_2 \geq 0.5; \)

\[ k = 1.0 + \left( \frac{x_1}{L} - 0.45 \right)^2 \text{ when } x_1/L \leq 0.45; \]
\[ k = 1.0 + 1.5 \left( \frac{x_1}{L} - 0.45 \right)^2 \text{ when } x_1/L > 0.45; \]

for the sides of deckhouses the factor \( k \) is assumed to vary for the length of bulkhead. For this purpose the deckhouse is subdivided into parts of approximately equal length not exceeding 0.15L each, and \( x_1 \) is taken as the distance between the after perpendicular and the middle of the part considered;

\( C_b \) is to be taken as not less than 0.6, nor greater than 0.8;

for the aft end bulkheads forward of amidships \( C_b \) = 0.8;

\( z_0 = \) as given in Table 2.12.3.2-2;

\( z_1 = \) vertical distance, in m, from the summer load waterline to the mid-point of the plate panel considered or the mid-point of span of the bulkhead stiffener.

The above-stated values of factor \( n \) apply to a ship having the freeboard equal to minimum tabular freeboard of Type "B" ships, and a standard height of superstructures according to Section 4 of Load Line Rules for Sea-Going Ships. If the deck of the tier considered is situated higher than the standard position due to an increase of freeboard, as against the tabular value, then the appropriate factor \( n \) may be determined by linear interpolation between the values of that factor for superstructures with standard and actual positions of decks under the superstructures.

In any case, the design pressure is not to be taken less than indicated in Table 2.12.3.2-3.

For ships of restricted area of navigation the design pressure may be reduced by multiplying by the factor \( \varphi_r \) obtained from Table 1.3.1.5.

2.12.4 Scantlings of structures of superstructures, deckhouses and quarter decks.

2.12.4.1 The thickness of side plating of short and long bridges, forecastle and poop, long forecastle and poop is to be determined according to 2.2.4.1 using the design loads given in 2.12.3.1.1. For short bridges, forecastle and poop, \( k_a = 0.7 \).

For long bridge, long forecastle and poop outside the end portions, \( k_a \) is determined according to 2.2.4.1; at sections in way of end bulkheads \( k_a = 0.7 \); within the end portions \( k_a \) is to be determined by linear interpolation.

The thickness of side plating of long bridges, long forecastle and poop is to satisfy the requirements of 2.2.4.8.

In any case, the thickness \( s_{min} \), in mm, of side plating of short bridges, forecastle and poop is not to be less than:

- for superstructures of the lowest tier
  \[ s_{min} = (4.5 + 0.025L)\sqrt{\eta} \]

- for superstructures of other tiers
  \[ s_{min} = (4 + 0.02L)\sqrt{\eta} \]

where \( \eta \) is obtained from Table 1.1.4.3.

Where \( L > 300 \) mm, \( L \) is to be taken equal to 300 m.

The reduction of minimum thickness is permitted in proportion to the ratio of adopted spacing to standard spacing (see 1.1.3), but not more than 10 per cent. In any case, for ships of 30 m and greater in length the minimum thickness is to be not less than 5 mm.

2.12.4.2 The thickness of deck plating of short and long bridges, forecastle and poop, long forecastle and poop, short and long deckhouses is to be determined according to 2.6.4.1.1 and 2.6.4.1.2 using the design loads stated in 2.12.3.1.2. For short bridges, forecastle, poop and short deckhouses, \( k_a = 0.7 \).

For long bridge, long forecastle and poop outside the end portions, \( k_a \) is determined as for the strength deck according to 2.6.4.1.2; at sections in way of end bulkheads \( k_a \) is to be determined by linear interpolation.

The thickness of deck plating of long bridges, long forecastle and poop, long deckhouses is to satisfy the requirements of 2.6.4.1.5 for the upper deck between the side and the line of large openings.

In any case, the thickness \( s_{min} \), in mm, of deck plating of short bridges, forecastle and poop, short deckhouses is not to be less than:

- for open forecastle deck
  \[ s_{min} = (4 + 0.04L)\sqrt{\eta} \] for \( L < 100 \) m;
  \[ s_{min} = (7 + 0.01L)\sqrt{\eta} \] for \( L \geq 100 \) m;

- for other decks of superstructures and deckhouses of the lowest tier
  \[ s_{min} = (5 + 0.01L)\sqrt{\eta} \]

- for superstructure and deckhouse decks of other tiers
  \[ s_{min} = (4 + 0.01L)\sqrt{\eta} \]

where \( \eta \) is obtained from 1.1.4.3.

Where \( L > 300 \) m, \( L \) is to be taken equal to 300 m.

The reduction of minimum thickness is permitted in proportion to the ratio of adopted spacing to standard spacing (see 1.1.3), but not more than 10 per cent. In any case, the minimum thickness may be reduced to 4 mm for ships of length \( L \geq 50 \) m and to 3 mm for ships of length \( L < 20 \) m, subject to agreement with the Register.

2.12.4.3 The plate thickness of the end bulkheads of superstructures, sides and end bulkheads of deckhouses is not to be less than that determined by Formula (1.6.4.4) taking:

- \( m = 15.8 \);
- \( k_a = 0.6 \);
- \( \Delta s = 0 \);
- \( p \) as defined in 2.12.3.2.

The thickness of side plating of deckhouses may be not less than that of superstructures as stated in 2.12.4.1, provided they are arranged similarly over the ship’s length and depth.

The thickness of bottom plate of end bulkheads in superstructures (deckhouses) of 1st tier is to be increased by 1 mm as compared with the design thickness. The width of bottom plate is to be not less than 0.5 mm.

If the deckhouse front extends in a fair convex form beyond the intersection with the deckhouse sides, the thickness of plating may be taken 0.5 mm less as compared with the design value.

2.12.4.4 In any case, the plate thickness \( s_{min} \), in mm, of superstructure end bulkheads, sides and end bulkheads of deckhouses is not to be less than:

- for the lowest tier
  \[ s_{min} = (5 + 0.01L)\sqrt{\eta} \]

- for other tiers
  \[ s_{min} = (4 + 0.01L)\sqrt{\eta} \]

where \( \eta \) is obtained from 1.1.4.3.

Where \( L > 300 \) m, \( L \) is to be taken equal to 300 m.

In any case, the minimum thickness is not to be less than 5 mm for ships of length \( L \geq 50 \) m. The minimum thickness may be reduced to 4 mm for ships of length \( L < 20 \) m and to 3 mm for ships of length \( L < 20 \) m, subject to agreement with the Register. Reduction of the minimum thickness is not permitted for fronts of bridge and unprotected front of poop in ships of length \( L \geq 20 \) m.
2.12.4.5 Framing of the sides, decks and end bulkheads of the forecastle, poop and bridge, quarter deck and deckhouse is to satisfy the following requirements:

.1 Side framing of the superstructure is to comply with the requirements for side framing in 'tween deck space as specified in 2.5.4.2 - 2.5.4.5 using the design loads given in 2.12.3.1.1. For longitudinal and side stringers of short bridge, forecastle and poop, \( k_a = 0.65 \).

For longitudinal and side stringers of long bridge, long forecastle and poop outside the end portions, \( k_a \) is determined according to 2.5.4.3 and 2.5.4.4; at sections in way of the end bulkheads \( k_a = 0.65 \); within the end portions \( k_a \) is to be determined by linear interpolation.

.2 Underdeck framing of the superstructure and deckhouse is to satisfy the requirements of 2.6.4.2-2.6.4.9 using the design loads stated in 2.12.3.1.2. For longitudinal and deck girders of short bridge, forecastle and poop, \( k_a = 0.65 \).

For longitudinal and deck girders of long bridge, long forecastle and poop outside the end portions, \( k_a \) is determined in accordance with 2.6.4.2 and 2.6.4.4; at sections in way of the end bulkheads \( k_a = 0.65 \); within the end portions \( k_a \) is to be determined by linear interpolation.

.3 The section modulus of vertical stiffeners of the end bulkheads of superstructures, deckhouse sides and end bulkheads is not to be less than that determined according to 1.6.4.1 taking:

\[
\begin{align*}
k_a &= 0.6; \\
\omega &= 1; \\
p &= \text{as defined in 2.12.3.2}; \\
m &= 12, \text{if the lower end of the stiffener is attached to the deck by a bracket}; \\
m &= 10, \text{if the lower end of the stiffener is welded to the deck}; \\
m &= 8, \text{if the lower end of the stiffener is sniped.}
\end{align*}
\]

The section modulus of stiffeners of deckhouse sides need not be greater than that of frames of superstructures as stated in 2.12.4.5.1, where arranged similarly over ship’s length and depth.

2.12.4.6 The scantlings of members of bulkheads and partial bulkheads inside the superstructures and deckhouses are to satisfy the requirements of 2.7.4.5, unless stated otherwise.

2.12.5 Special requirements.

2.12.5.1 The upper deck areas situated under the long bridge, long forecastle and poop outside the end portions are to satisfy the requirements of 2.6 for the second deck. Requirements for the upper deck areas situated under the ends of long bridge, long forecastle and poop are determined by linear interpolation between the requirements for the upper deck and those for the second deck.

2.12.5.2 In way of the end bulkheads the following requirements are to be complied with:

.1 Where the superstructure end bulkhead is not in line with the transverse bulkhead of the hull, partial bulkheads or pillars are to be fitted in spaces below the end bulkhead, or frames and beam knees are to be strengthened.

.2 Where the end bulkhead of long deckhouse is not in line with the transverse bulkhead below, short deck girders are to be fitted in line with deckhouse sides under the house deck so as to extend further for three frame spaces forward and aft of the deckhouse end bulkhead.

.3 At the section, where the end bulkheads of superstructures and deckhouses abut on the undek longitudinal structures and the sides of deckhouses — on the transverse underdeck structures fitted below (bulkheads, partial bulkheads, undek girders, deck transverses, etc.), the webs of these underdeck structures are to be stiffened with brackets.

2.12.5.3 The structure at the ends of superstructures is to satisfy the following requirements:

.1 At the ends of bridge, long forecastle and poop located within \( 0.6L \) midship region of a ship with a length \( L \geq 60 \) m the side plating is to be extended beyond the end bulkhead with smooth tapering to the ship’s side on a length \( d_1 \), in m, (Fig.2.12.5.3), determined by the formula

\[
d_1 = 0.2 (B/2 + h).
\]

On agreement with the Register, the value of \( d_1 \) may be reduced provided that the thickness of bottom strake of the superstructure side plating, sheerstrake and deck stringer plate within the region shown in Fig. 2.12.5.3 is increased.

.2 If the end of superstructure (forecastle, poop) is located within \( 0.1L \) from the fore or after perpendicular, as well as in ships of length \( L < 65 \) m, the value of \( d_1 \) in accordance with 2.12.5.3 may be reduced by half. If the end of a superstructure is located outside the above-mentioned regions and outside \( 0.6L \) amidships, the value of \( d_1 \) is to be determined by linear interpolation.

.3 The blunted ends of projecting side plates are to be machined flush with the deck.

The curved edge of side plating is to be stiffened by flat bar carried down for \( 50 \) mm from the edge. The ends of that bar are to be sniped.

Openings in side plating projecting beyond the ends of a superstructure are normally not permitted. The projecting plates are to be attached to the bulwark by means of flexible joints.

.4 At the ends of short bridge not extending from side to side of ship the attachment of the side to the deck should be made similarly to the attachment required by 2.12.5.4 for deckhouses, otherwise gussets are to be used to provide smooth transition from the side to a short deck girder strengthening the
deck under that side with simultaneous strengthening of the deck stringer plate within the region shown in Fig. 2.12.5.3.

2.12.5.4 Attachment of sides of the deckhouse to the end bulkhead arranged within 0.6L amidships of a ship with a length $L \geq 65$ m should be performed by rounding with a radius $r$, in m, determined by the formula

$$r = \frac{l_1}{100} (1.5 + 0.1l_1/b) \leq 1.4$$

where $b$ — breadth of the deckhouse in way of the end bulkhead, in m.

2.12.5.5 Rectangular openings in outer sides and top plating of long deckhouses should have their corners well rounded and should be substantially framed. Door openings in the sides of a deckhouse, arranged within 0.6L amidships, should be additionally reinforced with thickened plates as shown in Fig 2.12.5.5. Rectangular openings are not permitted for a length not less than the height of the deckhouse counted from the end bulkhead, if the deckhouse is situated on the strength deck.

If door openings in sides are arranged outside the midship region or if the deckhouse is short, the thickened plates may be fitted only below the opening as shown in Fig. 2.12.5.5.

Where the distance between the expansion or sliding joints is less than a triple height of the deckhouse, it is sufficient to provide the rounding of the corners of openings. Openings for side scuttles should have the upper and lower edges reinforced with horizontal stiffeners.

2.12.5.6 Requirements for quarter deck in ships greater than 90 m in length are subject to special consideration by the Register. The structures in way of the break at connection of the upper deck to quarter deck in ships of 90 m and under are to satisfy the following requirements:

1. The upper deck plating in way of the break is to extend abaf the break for three frame spaces in ships of 60 m in length and above, and for two frame spaces in ships less than 60 m in length. The upper deck plating of ships less than 40 m in length need not extend abaf the break.

2. The upper deck stringer plate is to extend abaf the steel plating for three frame spaces, where $L \geq 60$ m, and for two frame spaces, where $L < 60$ m.

The stringer plate so arranged should be tapered from its full width to a width equal to the depth of frame to which it is welded.

3. The stringer plate of quarter deck should extend forward in the form of a bracket gradually tapered to ship’s side on a length of three frame spaces. The quarter deck stringer plate projecting beyond the break is to be adequately stiffened and its free edge should have a face plate or flange.

4. The sheerstrake of quarter deck should extend forward of the deck stringer plate projecting beyond the break bulkhead for at least 1.5 times the height of break and should be smoothly tapered into the upper edge of ship’s side sheerstrake. For other structural requirements, see 2.12.5.3.

5. Diaphragm plates spaced not more than 1.5 m apart are to be fitted over the ship’s breadth between the overlapping decks in way of the break. The thickness of diaphragms is not to be less than the thickness of the break bulkhead plating.

The diaphragm plates are to be strengthened by vertical stiffeners.

Vertical stiffeners with effective flange are to have a moment of inertia not less than that obtained from Formula (1.6.5.6-1).

Continuous welds are to be used to attach the horizontal edges of diaphragm plates to the decks, and the vertical edges to break bulkhead on one side, and on the other side to an extra supporting bulkhead made of
continuous plate welded to the decks over the ship breadth. The plate thickness of that bulkhead is to be not less than the thickness of break bulkhead plating and may have openings between diaphragms.

.6 Where a supporting bulkhead is fitted, the diaphragm plates should be stiffened with brackets fitted to their ends (Fig. 2.12.5.6.6).

![Diagram](image)

Fig. 2.12.5.6.6:
1 — supporting bulkhead; 2, 6 — brackets; 3 — quarter deck; 4 — diaphragm; 5 — break bulkhead; 7 — upper deck; 8 — stiffener in line with bracket.

.7 Where a raised quarter deck is adjoining the bridge, it should extend into that superstructure for two frame spaces beyond the break, the extension being, in any case, not less than the elevation of superstructure above the quarter deck.

The quarter deck stringer plate should extend forward for two frame spaces with the width gradually reduced as required by 2.12.5.6.2.

Strengthening of the overlapping decks in way of break is to comply with requirements of 2.12.5.6.5 and 2.12.5.6.6 depending on the location of the break along the length of the ship.

The superstructure side plates extending aft of the superstructure are to be smoothly tapered into the sheerstrake on a length of at least 1.5 times the height of break (see also 2.12.5.3.1).

.8 Strengthening in case where the break bulkhead is located within 0.25L from the after perpendicular should comply with the following requirements:

in ships greater than 60 m in length, the supporting bulkhead fitted over the breadth the ship may be omitted. The free edges of diaphragm plates are, in this case, to be stiffened with face plates or flanges of a width equal to at least ten thicknesses of the diaphragm plate;

in ships of 60 m in length and below, the upper deck plating need not extend aft of the break over the ship breadth, however, the upper deck stringer and the raised quarter deck stringer and sheerstrake should be extended forward and aft as provided in 2.12.5.6.3 and 2.12.5.6.4.

2.12.5.7 The use of aluminium alloys for the construction of deckhouses is permitted. Decks of accommodation and service spaces situated above the machinery and cargo spaces should be made of steel.

The scantlings of aluminium deckhouses should be determined according to 1.6.6. The minimum scantlings are to be the same as those required for steel deckhouses.

The degree to which the deckhouse of aluminium alloys contributes to longitudinal bending of the hull and stresses in ship’s hull and deckhouse should be determined according to the procedure approved by the Register.

2.12.5.8 The helicopter deck members and supporting structures are to satisfy the following requirements:

.1 The helicopter deck members, depending on its location over the ship’s length and depth, should satisfy the requirements for members of weather deck as specified in 2.6 or superstructure (deckhouse) decks, as specified in 2.12.4.2 and 2.12.4.5.2. In any case, the design pressure is not to be less than:

$$p_{min} = 2 \, \text{kPa}.$$

.2 The helicopter deck members should satisfy the requirements for the members of decks intended for the carriage of cargo, as specified in 2.6. The design loading is determined according to 1.3.4.1 on the basis of the greatest mass of helicopters and equipment stowed on that deck during operation of the ship and the additional pressure of 0.5 kPa from snow cover or ice.

.3 The helicopter deck members should satisfy the requirements for deck members of ro-ro ships, as specified in 3.2. The design loading under the helicopter landing conditions is determined on the basis of the following:

$$Q_0 = \text{assumed load on the axle, taken to be equal to the maximum take off weight of helicopter, in kN;}$$

$$n_0 = 2 \, \text{— assumed number of wheels on the axle;}$$

$$n = 1 \, \text{— number of wheels forming a group;}$$

$$u \times v = 0.3 \times 0.3 \, \text{m}^2 \, \text{— size of tyre print;}$$

$$k_d = 1.5 \, \text{— dynamic amplification factor.}$$

.4 If the helicopter deck is not a superstructure or deckhouse deck, its supporting structures should satisfy the requirements for pillars as stated in 2.9 and/or partial bulkheads as specified in 2.7.4.5 using the design loads given in 2.12.5.8.1 — 2.12.5.8.3.

.5 If the helicopter deck has parts protruding beyond the side line, requirements for such a helicopter deck are subject to special consideration by the Register.

2.13 MACHINERY CASINGS

2.13.1 General.

2.13.1.1 Openings in decks and platforms over machinery spaces are to be protected by strong casings.
The casings may be omitted only in cases where the space on the deck or platform is a part of the machinery space.

2.13.2 Construction.

2.13.2.1 Where there are large openings in the deck in way of machinery space, additional piller and deck transverses are to be fitted for strengthening of the deck in way of machinery casing.

2.13.2.2 For the lower strake of the casing longitudinal wall plating, adjoining the strength deck within the 0,6L midship region of ships with a length L ≥ 65 m of steel grade and yield stress are to be the same as for the strength deck plating in this region.

2.13.2.3 Where the opening for machinery casing is arranged in the strength deck, the requirements of 2.6.5.1 regarding the design of corners and compensation for openings are to be complied with.

2.13.3 Scantlings of machinery casing structures.

2.13.3.1 The part of machinery casing located inside the enclosed spaces (‘tween deck spaces, forecastle, poop, bridge, deckhouse) should comply with the requirements of 2.7.4.5 for partial bulkheads. The spacing of stiffeners is not to exceed 0,9 m.

The thickness of plating of the part of machinery casing located inside the poop, bridge or deckhouse may be 0,5 mm less than specified.

2.13.3.2 The part of machinery casing located below the bulkhead deck should comply with the requirements of 2.7.2.3, 2.7.4.1 — 2.7.4.3 for watertight bulkheads where it is included in subdivision calculation as watertight construction.

2.13.3.3 The part of machinery casing located above weather deck should comply with the requirements of 2.12 for deckhouses situated in the same region of the ship. In calculating the design loading by Formula (2.12.3.2) c2 is to be taken equal to 1.

2.14 BULWARKS

2.14.1 General.

Bulwarks of strong construction are to be provided in places specified in Chapter 8.6 of Part III "Equipment, Arrangements and Outfit".

The construction of bulwarks in the midship region of ships of 65 m and above should be such that the bulwark contributes to longitudinal bending of the hull.

2.14.2 Construction.

2.14.2.1 The height of the bulwark as measured from the upper edge of the deck plating or from that of planking, if any, to the upper edge of the rail section is to comply with the requirements of 8.6.2 of Part III "Equipment, Arrangements and Outfit".

2.14.2.2 The bulwark plating within the 0,6L midship region of ships of 65 m and above should be welded to the upper edge of sheerstrake. Outside the above-mentioned region as well as in ships less than 65 m in length, the openings cut in bulwarks should be so designed as to ensure a smooth transition (with a radius not less than 100 mm) from the bulwark plate to the sheerstrake.

Within 0,07L from the fore perpendicular the welding of bulwark plating to the sheerstrake is necessary.

2.14.2.3 The bulwark is to be supported by stays spaced not more than 1,8 m apart. In the region of uprights for timber deck cargo, fastening to bulwarks, as well as at the fore end within 0,07L from the fore perpendicular, the spacing of stays is to be not more than 1,2 m. In the ships with large flare of sides and in ships with minimum assigned freeboard, stays may be required to be fitted at every frame within the region considered.

2.14.2.4 The stays are to be fitted in line with deck beams, brackets and other structures and are to be welded to the rail section, bulwark plate and deck. The attachment of stays to bulwark should be ensured on a length not less than half the height of the bulwark.

In welding the stays to the deck, holes sufficient in size to allow free passage of water to the scuppers are to be provided in the stays. The welded connection of the beam (bracket) to deck plating under the stay should not be weaker than the attachment of stay to deck.

Directly under the lower ends of stays no cut-outs in the deck beams and no gaps between frame ends and deck are permitted.

The dimensions of lightening holes in stays are not to exceed half the stay width in any section of the stay.

The free edges of stays are to be stiffened with face plates or flanges.

In general, the flanges (face plates) of stays are not to be welded to deck plating and rail section.

The flanges (face plates) on the outer edge of the stay are not to be welded to horizontal stiffener (flange) of lower edge of the bulwark in way of continuous cut-out.

2.14.2.5 The rail section should have a flange (face plate) or should be of bulb profile.

The lower edge of bulwark should be stiffened with horizontal stiffener or flange in way of continuous cut-out.

Bulwarks are to be adequately strengthened in way of mooring pipes, fairleads and eyeplates for cargo gear.

2.14.2.6 Requirements for the design of freeing ports in bulwarks are given in 1.1.6.5.

2.14.3 Loading on bulwarks.

The external pressure determined by Formula (1.3.2.2) is the design pressure p, in kPa, acting on
the bulwark. The design pressure is to be taken not less than:

\[ p_{\text{min}} = 0.02 L + 14, \]

but not less than 15 kPa.

Where \( L > 300 \) m \( L \) is to be taken equal to 300 m. For ships of restricted area of navigation the value of \( p_{\text{min}} \) may be reduced by multiplying by the factor \( q_r \) obtained from Table 1.3.1.5.

**2.14.4 Scantlings of bulwark structures.**

2.14.4.1 The thickness of the bulwark plating is not to be less than: \( s = 0.065 L + 1.75 \) for \( L \leq 60 \) m and \( s = 0.025 L + 4.0 \) for \( L > 60 \) m, but not less than 3.0, nor greater than 8.5 mm.

The thickness of bulwark plating of a superstructure located beyond \( 1/4 \) of the ship’s length from the fore perpendicular, as well as that of bulwark plating of 2nd tier deckhouses or superstructures may be reduced by 1 mm.

For 3rd and above tiers of the deckhouses the thickness of the bulwark plating need not exceed the thickness required for the plating of sides of 3rd tier deckhouse.

2.14.4.2 The section modulus of bulwark stay adjoining the deck plating is not to be less than determined according to 1.6.4.1 taking:

\[ p = \text{as defined in 2.14.3;} \]
\[ m = 2; \]
\[ k_p = 0.65. \]

Where the bulwarks are cut to form a gangway or provision is made for expansion joints, the section modulus of stay at the ends of the openings or expansion joints is to be increased by 25 per cent.

The width of stay at the upper end is to be equal to that of the rail section.

2.14.4.3 Where the deck cargo effect on the bulwark is contemplated, the scantlings of the bulwark stays are to be determined by strength calculation involving effect of the said cargo, with regard for heel of the ship determined by Formula (1.3.3.1-5) and acceleration in the horizontal-transverse direction, determined by Formulae (1.3.3.1-2); the permissible stress factor is determined according to 2.14.4.2.
3 REQUIREMENTS FOR STRUCTURES OF SHIPS OF SPECIAL DESIGN

3.1 SHIPS WITH LARGE DECK OPENINGS

3.1.1 General and symbols.
3.1.1.1 The requirements of this Chapter are additional to those of Sections 1 and 2.
3.1.1.2 The requirements for deck structure, exclusive of those for cantilever beams, apply to ships with single, twin and triple cargo hatchways which are considered to form a large deck opening meeting the following conditions:

\[ \frac{b}{B} \geq 0.7; \quad \frac{l}{l_m} \geq 0.7. \]

The requirements of this Chapter are to be applicable throughout the entire cargo hatch region, including the engine room, provided it is located between the cargo holds.

3.1.1.3 The requirements for container securing arrangements and hull structures, which take up forces exerted by the said arrangements, apply to container ships.

3.1.1.4 The cantilever beam is a short deep half beam for which the supporting effect of the side hatch coaming is disregarded in the strength and buckling strength calculation to be made for deck grillage in accordance with 2.6.4.4 and 2.6.4.9 respectively.

3.1.1.5 Symbols:

- \( b \) = breadth of deck opening determined as the distance between the outer longitudinal edges of hatchway openings at ship’s sides, in m;
- \( l \) = length of hatchway opening, in m;
- \( l_m \) = distance between centres of transverse deck strips at each end of opening, in m;
- \( c \) = distance between transverse edges of adjoining openings, in m;
- \( n \) = total number of 20-ft containers carried by the ship.

3.1.2 Construction.

3.1.2.1 For ships with a length \( L \geq 80 \) m longitudinal framing system is provided for the deck and bottom.

3.1.2.2 Upper deck and side longitudinals are to be continuous within the region stated in 3.1.1.2.

3.1.2.3 Ends of cargo hatch continuous side coamings are to be attached as required by 1.7 and 2.6.2. It is not recommended that continuous side coamings be attached to the front bulkhead of the aft superstructure and the aft bulkhead of the forecastle.

3.1.2.4 Abrupt changes of cross section and shape of members referred to in 3.1.2.2 over the length of the ship is generally not permitted. Where such changes are necessary, arrangements are to be such as to minimize the creation of stress concentration and attention is to be paid to provision of buckling strength.

3.1.2.5 The attachment of the forward end of the longitudinal strip to the deck where there is a cargo hatch single opening forward of the attachment is to be specially considered by the Register.

3.1.2.6 It is recommended that transverse and longitudinal deck strips have a box-shaped cross section.

3.1.2.7 Transverse deck strips are to be efficiently attached to the underdeck framing members and web frames in line with which they are fitted. Where the plating of the deck strips is arranged in line with the upper flanges of continuous hatch side coamings, the attachment of deck strips to the deck and side shell is to be specially considered by the Register.

3.1.2.8 Openings in the deck plating in immediate proximity to the attachments of transverse and longitudinal deck strips are not permitted.

3.1.2.9 Large deck openings:

- Adjacent corners of hatch openings in the upper deck arranged in one line are to be rounded with a radius \( r \), in m, (Fig. 3.1.2.9) not less than:

\[ r = kb \quad (3.1.2.9.1) \]

where \( k = 0.025 \) when \( c/b \leq 0.04 \);

\( k = 0.050 \) when \( c/b \geq 0.2 \), the intermediate values of \( k \) are to be obtained by linear interpolation.

![Fig. 3.1.2.9](image-url)
In way of longitudinal deck strips the value of \( r \) may be reduced by 40 per cent.

Given below are minimum radii of rounding of opening corners:

\[ r_{\min} = 300 \text{ mm in way of deck stringer plate;} \]
\[ r_{\min} = 250 \text{ mm in way of longitudinal deck strips.} \]

Thickened insert plates are required at hatch corners (see Fig.3.1.2.9).

1. In way of conjugations of open and enclosed parts of the hull (adjacent to the engine room, bow, etc.) the corner radius of hatch openings is not to be less than:

\[ r = 0.07b \quad (3.1.2.9.2) \]

2. Hatch corners in the areas where cargo hatchways arranged abreast change in number are to be specially considered by the Register.

3. For general requirements regarding deck openings, see 2.6.5.1.

3.1.2.10 The cantilever beams are to be fitted in line with web frames. Their connection is to satisfy the requirements of 1.7.2.3.

The cantilever beams are to be fitted with minimum stiffeners as shown in Fig. 3.1.2.10.

![Fig.3.1.2.10 Stiffening of cantilever beams](image)

3.1.2.11 Stiffeners, brackets or deep members are to be fitted under the vertical guides or corner fittings of containers in double bottom of container ships. The inner bottom plating in these locations is to be increased in thickness or the corner fitting sockets are to be welded therein.

The above also applies to lattice pots.

Similar increase in the plating thickness and stiffening in way of container corner fitting pockets and lashing pots should be provided in deck structure.

3.1.3 Design loads.

3.1.3.1 The design still water bending moment is to be determined in accordance with 1.4.3.

3.1.3.2 The vertical wave bending moment is to be determined in accordance with 1.4.4.

3.1.3.3 The design horizontal wave bending moment \( M_{hw} \), in kN·m, is determined by the formula

\[ M_{hw} = 250k_{w}c_{w}BL^{2}C_{f}y_{v}10^{-3} \quad (3.1.3.3) \]

where \( k_{w} = a(d/b + 0.3); \)
\[ a = 1 - 4d/L; \]
for \( c_{w} \), see 1.3.4.1:

\[ c_{w} = 0.5(1 - \cos \frac{2\pi x}{L}); \]

\( x \) = distance between the considered section and the after perpendicular, in m.

3.1.3.4 The design components of a wave torque, in kN·m, are determined by the formulæ:

\[ M_{nv1} = 63k_{w}c_{w}BL^{2}z_{g}10^{-3}; \quad (3.1.3.4-1) \]
\[ M_{nv2} = 63k_{w}2c_{w}BL^{2}C_{f}y_{v}10^{-3}; \quad (3.1.3.4-2) \]
\[ M_{nv} = 126k_{w}c_{w}BL^{2}C_{f}y_{v}10^{-3}; \quad (3.1.3.4-3) \]

where \( k_{w} = 2a_{g}[1 + 3.6(C_{WL} - 0.7)]B/L; \)
\[ k_{1} = 10d/L \quad (3.1.3.4); \]
\[ e_{1} = 1 - 8d/L; \]
\[ C_{WL} = \text{water plane area coefficient for summer load waterline}; \]
for \( a_{g} \), see 3.1.3.3:

\( e = \text{vertical distance from the torque centre to a point at 0.6} \)

\[ z_{g} = 0.5(1 - \cos \frac{2\pi x}{L}); \]

\[ z_{v} = \sin \frac{2\pi x}{L}; \]

\[ z_{v} = \sin \frac{2\pi x}{L}; \]

for \( x \), see 3.1.3.3.

3.1.3.5 For container ships, the design statical torque \( M_{st} \), in kN·m, is determined by the formula

\[ M_{st} = 30\sqrt{nB} \quad (3.1.3.5) \]

where \( n = \text{total number of 20-ft containers carried by ship}. \)

3.1.3.6 For ships of restricted area of navigation, the horizontal wave bending moment (see 3.1.3.3) and the components of a wave torque (see 3.1.3.4) are to be multiplied by the reduction factor \( \varphi \) determined in accordance with Table 1.4.4.3.

3.1.3.7 The design loads for cantilever beams are determined in accordance with 2.6.3.

3.1.3.8 The design loads on container securing arrangements are determined with due regard for the inertia forces caused by ship’s accelerations at
motions in accordance with 1.3.3.1. The design mass value of ISO series 1 containers is:

24.0 t for 20-ft containers,
30.5 t for 40-ft containers.

When calculating strength of container securing arrangements fitted on weather deck, account should be taken of loads from the wind in the direction perpendicular to the centreline of the ship. The design value of wind pressure is:

\[ p = 1.0 \text{ kPa}. \]

### 3.1.4 Scantlings of structural members.

#### 3.1.4.1 The combined stresses \( \sigma_L \), in MPa, in strength deck longitudinals, determined by Formula (3.1.4.1-1) are not to exceed 190/H in any section

\[ \sigma_L = \sigma_{sy} + \sigma_{sz} + k_L \sigma_w \]  

(3.1.4.1-1)

where \( \sigma_{sy} \) = normal stresses, in MPa, in the section considered due to still water bending moment, determined by the formula

\[ \sigma_{sy} = \frac{M_{sy}}{W_{sy}^{de}} \cdot 10^3^2 \]  

(3.1.4.1-2)

for \( M_{sy} \), in kN·m, see 1.4.3;
\( W_{sy}^{de} \) = actual hull section modulus in way of deck, as defined in 1.4.8;
\( \sigma_{sz} \) = normal stresses, in MPa, in the section considered due to the static torque \( M_z \) (see 3.1.3.5), determined by the formula

\[ \sigma_{sz} = \frac{R_m \sigma_m}{I_m} \cdot 10^3 \]  

(3.1.4.1-3)

\( B_m \) = bioment in considered section along the length of open part of the ship under the effect of the static torque \( M_{sy} \), in kN·m²;
\( \sigma_m \) = main sectional area at the considered section point, in m²;
\( I_m \) = main sectional moment of inertia, in m⁴;
\( B_{sy}, \sigma_{sy}, I_{sy} \) are determined according to the procedure approved by the Register;
\( \sigma_w \) = normal stresses, in MPa, in considered section due to vertical wave bending moment, determined by the formula

\[ \sigma_w = \frac{M_{sy}}{W_{sy}^{de}} \cdot 10^3 \]  

(3.1.4.1-4)

for \( M_{sy} \), see 1.4.4;
\( k_L \) = factor by which vertical bend stresses are increased taking the horizontal bending and torque into account. It is determined by the formula:

\[ k_L = \sqrt{1 + 1.15(0.85 + L/600)(\sigma_n + \sigma_v)} \]

\( \sigma_n = \sigma_n/\sigma_m \);
\( \sigma_v = \sigma_v/\sigma_m \);
\( \sigma_n \) = normal stresses, in MPa, in considered section due to design horizontal wave bending moment, determined by the formula

\[ \sigma_n = \frac{M_{sy}}{W_{sy}^{de}} \cdot 10^3 \]  

(3.1.4.1-5)

for \( M_{sy} \), see 3.1.3.3;
\( W_{sy}^{de} \) = actual hull section modulus about the vertical axis through the centreline of the ship, in cm⁴, determined by the formula

\[ W_{sy}^{de} = \frac{L}{Y} \cdot 10^3 \]

\( L_c = \) actual inertia moment of the hull about the vertical axis, in cm⁴·m²;
\( Y = \) half the ship’s breadth in the considered section, in m;

\( \sigma_{sy} = \sigma_{sy}/\sigma_m \);
\( \sigma_m = \) total warping stresses, in MPa, under the effects of the torques \( M_{sy}, M_{sz}, M_{w} \), determined by the formula

\[ \sigma_{sy} = \frac{\sqrt{(\sigma_{sy} - \sigma_{sz})^2 + \sigma_{sy}}}{\sigma_{sy}} \]  

(3.1.4.1-5)

\( \sigma_{sz} \) = normal warping stresses, in MPa, under the effects of the torques \( M_{sy}, M_{sz}, M_{w} \), (see 3.1.3.4), determined by the formula

\[ \sigma_{sy} = \frac{B_m \sigma_m}{I_m} \cdot 10^3 \]  

(3.1.4.1-6)

\( B_m \) = bioment in considered section along the length of the open part of the ship under the effects of \( M_{sy}, M_{sz}, M_{w} \), respectively, in kN·m². The bioment are determined by the procedure approved by the Register.

#### 3.1.4.2 Kinematic parameters of warping are to be determined.

The elongation of hatch opening diagonal under the effect of hull warping is not to exceed 35 mm. Where such elongation obtained by calculation is in excess of 35 mm, measures specially agreed with the Register are to be taken for opening edge reinforcements. The calculation is to be made in accordance with the procedure approved by the Register.

#### 3.1.4.3 Adequate buckling strength of the longitudinal deck strip between the supports as well as that of its items as regards the compressive stresses due to longitudinal bending are to be ensured.

#### 3.1.4.4 Where the ratio of the length of the hatch opening to the width of the deck portion from the side shell to the longitudinal edge of the nearest hatch opening exceeds 10, calculation of shape deformation of the deck portion concerned in the horizontal plane in accordance with the procedure approved by the Register and use of the results obtained in assessment of the deck stressed state, design of hatch covers and side framing may be required.

#### 3.1.4.5 The scantlings of cantilever beams and adjoining web frames are to satisfy the following requirements:

1. The section modulus, in cm³, of cantilever beam at a section in way of the end of a beam knee is not to be less than:

\[ W = \frac{1}{2} \frac{pT + Q}{k_m \sigma_n} \cdot 10^3 \]

(3.1.4.5.1)

where \( pT \) = intensity of design loading, in kPa, on the deck plating supported by the cantilever beam, as required by 3.1.3.7;
\( T \) = distance between adjacent cantilever beams, in m;
\( Q \) = load, in kN, transmitted from hatch cover to the cantilever beam;
\( k_m = 0.6; \)
\( \sigma_n \) = as defined in 1.1.5.3.
The sectional area of the web of cantilever beam is not to be less than that determined according to 1.6.4.3 taking:

\[ k_e = 0.6, \]

\[ N_{max} = pk + Q \] for the section at the end of the beam bracket;

\[ N_{max} = Q \] for the section in way of the hatch side coaming adjoining the cantilever beam.

2 The section modulus of the web frame connected to the upper deck cantilever beam at the section in way of the end of the beam bracket is not to be less than that determined by Formula (3.1.4.5.1).

The section modulus of the web frame connected to the cantilever beam of the lower deck and fitted below that deck at the section in way of the end of the beam bracket is to comply with the same requirement but may be reduced by the value of section modulus of the web frame fitted above that deck, at the section in way of the end of the bracket adjoining the deck.

3.1.4.6 The scantlings of container securing arrangements are to be determined on the basis of strength calculations using the design loads complying with the requirements of 3.1.3.8, and the resulting stresses are not to exceed the permissible ones determined using the permissible stress factors \( k_e = k_t = 0.75 \).

The strength of hull structures taking up forces from the container securing arrangements is to be verified by calculation of the effects produced by these forces, and the resulting stresses are not to exceed the permissible ones specified in Section 2 for the appropriate structures.

### 3.2 Roll-on-Roll-off ships

3.2.1 General and symbols.

3.2.1.1 The requirements of this Chapter apply to ro-ro ships, ro-ro passenger ships and are supplementary to those of Sections 1 and 2.

These requirements also apply to decks and double bottoms of ships carrying wheeled vehicles for use in cargo handling.

3.2.1.2 Symbols.

- \( Q_0 \) = static load on the axle of the wheeled vehicle, in kN;
- \( n_0 \) = number of wheels on an axle;
- \( n \) = number of wheels forming a design load spot (for a single wheel \( n = 1 \));
- \( u \) = size of a tyre print normal to the axis of rotation, in m;
- \( v \) = size of a tyre print parallel to the axis of rotation, in m;
- \( e \) = spacing between adjacent tyre prints, in m;

\( l_a \) = design load spot dimension parallel to the smaller side of the panel (directed across framing members), in m;

\( l_b \) = design load spot dimension parallel to the larger side of the panel (directed along framing members), in m;

\( a, b \) = smaller and larger sides of panel, respectively, in m;

\( l \) = span of the considered girder between supports, in m (see 1.6.3.1).

3.2.2 Construction.

3.2.2.1 Vehicle decks and double bottoms of ro-ro ships and car ferries are, in general, to be longitudinally framed. If framed otherwise, the above structures are subject to a special consideration by the Register.

3.2.2.2 Movable decks fitted temporarily for the carriage of vehicles are to be so fixed as to prevent these decks from taking up longitudinal forces under the hull longitudinal bending.

The Rules provide for movable deck structure consisting of a top decking with a web structure and longitudinals welded thereto. Other forms of movable deck construction will be specially considered by the Register.

3.2.3 Loads from wheeled vehicles.

3.2.3.1 The design loads are to be based on specification details of vehicles carried on board the ship and used for cargo handling. The design documentation submitted to the Register for the consideration is to include statical load on vehicle axle, number of wheels on the axle, wheel spacing, tyre print dimensions and tyre type.

Where wheel print details are not initially available, the requirements of 3.2.3.5 are to be applied.

3.2.3.2 The design load spot dimensions \( l_a \) and \( l_b \) are to be chosen as the overall dimensions of the print of a wheel group consisting of a maximum number of wheels and complying with the following conditions:

when determining the required plating thickness, the prints of all the wheels in a group are to be arranged within the panel surface (i.e. \( l_a \leq a \) and \( l_b \leq b \), see Table 3.2.3.2);

when determining the section modulus and cross section of a main framing girder, the prints of all the wheels of a group are to be fully arranged within the surfaces of two panels adjacent to the girder under consideration (i.e. \( l_a \leq 2a \) and \( l_b \leq l \), see Fig. 3.2.3.2).

The wheels may be united in a group irrespective of the distance between prints provided the overall dimensions of the group are in accordance with the above limitations.

Where two positions of the design load spot are possible (along and across main framing), \( l_a \geq l_b \) is to be adopted as the design case (i.e. the spot positioned with its larger side along main framing).
3.2.3.3 To be considered are the loads resulting from the operation of vehicles during cargo handling operations and from stowage of vehicles on the deck under conditions of the ship motions.

3.2.3.4 The design load $Q$, in kN, is to be determined by the formula

$$Q = k_d Q_0 \frac{n}{n_0}, \quad (3.2.3.4)$$

where $k_d = a_1 a_2$ — dynamic coefficient in the process of operation of vehicles used for cargo handling operations;

$a_1 =$ factor equal to: 1,10 and 1,05 for vehicles (except fork lift trucks) having an axle load less than 50 kN and 50 kN and more, respectively; 1,0 for fork lift trucks;

$a_2 =$ factor equal to: 1,03 and 1,15 for pneumatic and cast-rubber tyres, respectively; 1,25 for wheels with a steel rim;

$k_d = 1 + a_1 a_2$ — dynamic factor characterizing the ship motions;

$a_2$ — acceleration in the ship section under consideration in accordance with 1.3.3.1.

Where distribution of the load between wheeled vehicle axles is not uniform, the maximum axle load is to be taken as the design load. For fork lift trucks it is assumed that the total load is applied to the forward axle.

3.2.3.5 Where specifications on tyre print dimensions are not available, the tyre print dimension normal to the wheel axle $u$, in m, is to be determined by the formulas:
3.2.3.8 The design loads for side shell and permanent deck primary members are to be those to satisfy the most severe stowage arrangement of all cargoes carried on deck (including package cargo, containers, wheeled vehicles, etc.) and to allow for statical and inertia forces resulting from the ship motions. Accelerations are to be determined in accordance with 1.3.3.1.

3.2.3.9 The design load $Q$, in kN, for the transverses and girders of movable decks is to be determined by the formula

$$Q = k_d (p_s + p_d) a_2 l,$$

where $k_d$ — as defined in 3.2.3.4;
$p_s$ — static deck loading from the cargo carried, in kPa;
$p_d$ — static deck loading from deck own mass, in kPa;
$a_2$ — mean spacing of transverses and girders, in m.

The value of $(p_s + p_d)$ is not to be taken less than 2.5 kPa.

3.2.4 Scantlings of deck and side shell structures.

3.2.4.1 The thickness of plating $s$, in mm, is not to be less than

$$s = \left(\frac{17Qk_0}{l_{bg} t_{dh} R_{dp} k_k k_3}\right)^{0.6} + 2,$$

where $Q$ — as defined under 3.2.3;
$k_0$ — factor accounting for the effects of total hull bend:

$$k_0 = \frac{1}{1.4 - 0.8W/a} \geq 1$$ — for the upper (strength) deck amidships with loads acting at sea;

$k_1 = 1$ elsewhere;
$k_2 = 0.83/s;
{k_3} = 0.84/s - 0.185;
{k_4} = 0.18/s + 0.38;
W_a$ — actual hull section modulus for deck in accordance with 1.4.8.

3.2.4.2 The section modulus $W$ of longitudinalS and beams, in cm$^3$, is not to be less than determined from 1.6.4.1 with

$$W = \frac{5.84}{\left[1 - 0.57l_h/l\right]k_0};$$

$k_d = 1 - 0.204(l_w/a)^2 + 0.045(l_w/a)^3$;
$k_0 = 0.8/k_0$ — for cargo handling operations in port;
$k_0 = 0.7/k_0$ — with loads applied at sea;
$k_0$ — factor defined in 3.2.4.1.

3.2.4.3 The web cross-sectional area $f_w$, in cm$^2$, of beams and longitudinalS is not to be less than determined in accordance with 1.6.4.3 with

$$N_{max} = Q k_d (1 - 0.47l_h/l);$$

where $Q$ — as defined in 3.2.3;
$k_0$, $k_2$, $k_3$ — factors defined in 3.2.4.2.

3.2.3.6 If the size of wheel prints is adopted in accordance with 3.2.3.5, the design load $Q$ should be increased by 15 per cent.

3.2.3.7 The design load for train rails, in kN, is to be determined by the formula

$$Q = 0.5k_d Q_0 n_1,$$

where $k_d = 1.1$ if the vehicle moves about during cargo-handling operations;
$k_d = 1 + a_2 / g$ in case of the ship motions;

\[ a_1 \] — acceleration in considered ship section in accordance with 1.3.3.1;
\[ n_1 \] — number of vehicle wheels arranged within the design span of framing member supporting railways.
3.2.4.4 The plating thickness, section modulus and cross-sectional area of beams and longitudinals of movable decks are to be determined in accordance with 3.2.4.1, 3.2.4.2 and 3.2.4.3. Where beams and longitudinals are freely supported by girders and transverses, the factor \( m \) should be determined by the formula

\[
m = \frac{8}{k_d (2 - \frac{l_0}{l_1})},
\]

(3.2.4.4)

where \( k_d \) — factor defined in 3.2.4.2.

Otherwise, the factor \( m \) is to be determined as for beams and longitudinals of permanent cargo decks according to 3.2.4.2.

3.2.4.5 The section modulus of longitudinals \( W \), in cm\(^3\), supporting fixed rails is not to be less than determined in 1.6.4.1 with

\[ Q \] — as defined in 3.2.3.7;

\( m \) to be determined by the formula

\[
m = \frac{5.85}{(1 - k_{st}/2)T},
\]

(3.2.4.5)

where \( k_0 = 0 \) with \( n_1 = 1 \);

\( k_3 = 0.5n_2 \) with \( n_1 \geq 2 \);

\( n_2 \), see 3.2.3.7;

\( e_0 \) — mean spacing of centres of wheels arranged within the design member span, in m;

\( k_\alpha = 0.7/k_0 \);

\( k_0 \) — factor determined by 3.2.4.1.

3.2.4.6 The scantlings of deep members of sides and permanent cargo decks, as well as of pillars are to be derived by direct calculation using the procedures approved by the Register.

3.2.4.7 The section modulus of the girders and transverses of movable decks \( W \), in cm\(^3\), is not to be less than determined by 1.6.4.1 with

\[ Q \] — as defined in 3.2.3.9;

\( m = 12 \) for fixed members;

\( m = 8 \) for freely supported members;

\( k_\alpha = 0.7 \).

3.2.5 Special requirements.

3.2.5.1 A side fender protecting the ship side and stern from damage during mooring operations is to be fitted at the lower cargo deck level of ferries.

3.2.5.2 A longitudinal is to be fitted under each rail on the cargo decks of train ferries.

3.2.5.3 Where train decks with rails which are flush with the deck plating are provided on ships carrying railway carriages, the actual section modulus and sectional area of deck transverses are to be determined for the section located in the rail recess. Structural continuity of the effective flange of the deck transverse, where it intersects the rail, is to be ensured. In any case, the intersections of the fixed rails with deck transverses is to be specially agreed with the Register.

3.2.5.4 Where rails for the transport of railway carriages are welded to the deck plating throughout the entire length, the rail butts are to be welded with full penetration.

3.3 BULK CARRIERS AND OIL OR BULK DRY CARGO CARRIERS

3.3.1 General.

3.3.1.1 The requirements of this Chapter apply to ships designed for the carriage of bulk dry cargoes and to ships designed both for the carriage of bulk dry cargoes and crude oil (oil products) in bulk.

3.3.1.2 The scantlings of structural members bounding the cargo region are to be determined as required by Sections 1 and 2 on assumption of the carriage of bulk or liquid cargo (water ballast) in the holds primarily designed for the purpose concerned. The value to be adopted is the greater of the appropriate strength characteristics of the item.

3.3.1.3 The requirements for the structures not mentioned in this Chapter are to be as given in Sections 1 and 2.

In any case, the requirements for the hull and its structures are not to be less stringent than those stated in Sections 1 and 2.

3.3.1.4 The basic structural type of ships is considered to be a single-deck ship with machinery aft, having a flat (or nearly a flat) double bottom in the holds (permissible slope of the inner bottom from the side to the centreline is not over 3°), hopper side and topside tanks, single or double skin sides, transverse hold bulkheads of plane, corrugated or cofferdam type, which is primarily intended for bulk cargoes.

3.3.1.5 In combination carrier the length of the holds is not to exceed 0,1L. Holds of a greater length require special consideration by the Register in each case.

It is assumed that when carrying heavy bulk cargo, certain holds remain empty, their numbers are to be indicated in line "Other characteristics" in Classification Certificate as stated in 2.3 of Part I "Classification".

3.3.2 Construction.

3.3.2.1 Longitudinal framing is to be adopted for the deck, the side shell in way of topside tanks and the sloped bulkheads of topside tanks. The deck plating between end coamings of adjacent cargo hatches is to be additionally strengthened with intercostal transverse stiffeners fitted at every frame.

The double bottom is to be longitudinally framed. The double bottom structure in which all bottom and inner bottom longitudinals are replaced by side girders may be permitted (see 2.4.2.4.2).

The single skin side between topside and hopper side tanks is to be transversely framed.

Longitudinal or transverse framing may be adopted for the double skin side and in the hopper side tanks.

The transverse watertight bulkheads may be plane with vertical stiffeners, corrugated with vertical corrugations or of a cofferdam type.
3.3.2.2 A hatch side coaming is to be fitted with horizontal stiffeners. At every alternate frame the coaming is to be stiffened with vertical brackets fitted between the coaming flange and the deck.

3.3.2.3 The slope angle of topside tank walls to the horizontal axis is not to be less than 30°.

Inside topside tanks, in line with hold transverse bulkheads, diaphragms are to be fitted, the plating of which may generally have drain and access holes of minimum size. The plating of transverse bulkheads inside topside tanks is to be strengthened with stiffeners. The ends of vertical stiffeners are to be bracketed.

In topside tanks transverse beams are to be fitted in line with deck transverses.

To stiffen the plates of the tank vertical walls which are in line with the hatch side coaming, brackets are to be placed inside the tanks in line with every stay of side coaming. These brackets are to be extended to the deck and tank sloped bulkhead longitudinals nearest to the centreline.

At every frame, in the lower corner of the tank, brackets are to be fitted in line with the brackets attaching the hold frame to the sloped bulkhead of the tank. These brackets are to be carried to the ship's side and tank sloped bulkhead longitudinals nearest to the lower corner of the tanks and welded to them so as to extend beyond the brackets of frames.

3.3.2.4 The slope angle of hopper side tank walls to the horizontal is not to be less than 45°. The extension of the tank over the ship breadth at the inner bottom level is generally not to be less than 0.125B on one side.

Transverse diaphragms are to be fitted in line with transverse bulkheads and every alternate plate floor. The diaphragms may have drains and access holes. The total height of openings at the section of diaphragm, in the direction along the normal to the tank plating, from a line drawn through the opening centre perpendicularly to that normal, to the plating is not to exceed 0.5 of the height of that section anywhere. The opening edges are to be reinforced with face plates or stiffeners. The diaphragm plating is to be stiffened as required by 1.7.3.2 for the floor stiffeners.

Inside longitudinally framed tank, brackets are to be fitted in line with every frame. These brackets are to be carried to the sloped bulkhead and side longitudinals and welded to them so as to extend beyond the brackets of frames.

At the outboard side girder forming transversely framed hopper side tank wall, brackets are to be fitted in line with every frame. These brackets are to be carried to the nearest bottom and inner bottom longitudinals and welded to them.

3.3.2.5 Within the cargo area, the single-side structure is to comply with the following requirements:

1. The scantlings of side hold frames immediately adjacent to the collision bulkhead are to be increased in order to prevent excessive imposed deformation on the shell plating. As an alternative, supporting structures are to be fitted which maintain the continuity of fore peak stringers within the foremost hold.

2. Frame ends should be attached with brackets. The vertical dimension of the lower and upper brackets, as measured at shell plating, is not to be less than 0.125 of the frame span. On the level of the frame adjoining the bilge and underdeck tank, the breadth of the lower and upper brackets is not to be less than half the web height.

3. Frames are to be fabricated symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes. The end brackets adjoining the underdeck and bilge tanks are to be blunted, and the flange ends are to be sniped. The side flange frame is to be curved at the connection with the end brackets. The radius of curvature is not to be less than r, in mm, determined by the formula

\[ r = 0.4b_{fr} / s_{br}, \]

where \( b_{fr} \) — the flange width, in mm;
\( s_{br} \) — the thickness of brackets, in mm.

4. In ships below 190 m in length, normal steel frames may be asymmetric. The face plates or flanges of brackets are to be snipped at both ends. The brackets are to be arranged with soft toes.

5. Where, a frame being connected to an underdeck tank, the frame or its bracket overlaps with a horizontal section of an inclined wall, provision should be made for the bracket to go over the bent section, and the angle between the plane of the face plate (bracket) and the inclined tank wall is not to be less than 30°.

6. The web depth to thickness ratio of frames is not to exceed the following values:

- 60/\( \sqrt{\eta} \) for symmetrically flanged frames,
- 50/\( \sqrt{\eta} \) for asymmetrically flanged frames.

7. The outstanding flange is not to exceed 10/\( \sqrt{\eta} \) times the flange thickness.

8. In way of the foremost hold, side frames of asymmetrical section are to be fitted with tripping brackets which should be welded to shell plating, webs and face plates of frames.

9. Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper wing tank plating and web to face plates. For this purpose, the strength factor \( \alpha \) for a weld (see 1.7.5.1) is adopted equal to:

- 0.44 where frame webs are to be welded to shell plating on lengths equal to 0.25 of the frame span as measured from the upper and lower frame end, and
where bracket webs are to be welded to the plating of underdeck and bilge tanks;

0.4 where frame webs are to be welded to shell plating outside the above end sections.

Where the hull form is such as to prohibit an effective fillet weld, edge preparation of the web of frame and bracket may be required, in order to ensure the same efficiency as the weld connection stated above.

3.3.2.6 The ends of plane bulkhead stiffeners are to be bracketed to the inner bottom plating and to deck structures.

3.3.2.7 The cofferdam bulkheads are to satisfy the following requirements:

1. The construction of cofferdam bulkheads, as stipulated under 2.7.1.2, should consist of two tight platings, diaphragms and/or platforms. To stiffen the plating, vertical or horizontal stiffeners may be fitted.

2. The vertical or horizontal stiffeners of both platings are to be identical, form a ring structure and pass continuous through the platforms or, accordingly, diaphragms. The vertical stiffeners of both platings are to be fitted in the same plane parallel to the centreline of the ship; the horizontal stiffeners are to be fitted in the same plane parallel to the base line of the ship.

Cross ties are permitted between the vertical or horizontal stiffeners of both platings, at the mid-span thereof.

3. The diaphragms or platforms are to be stiffened in accordance with 1.7.3.2. The smaller side, in mm, of the panel of diaphragm or platform to be stiffened is not to exceed $100s\sqrt{\eta}$, where $s$ is the thickness of diaphragm or platform, in mm.

4. For access to all parts of the cofferdam bulkhead an adequate number of openings (manholes) is to be provided in the diaphragms and platforms. The total width of openings in one section of the diaphragm or platform is not to exceed 0.6 of the cofferdam bulkhead thickness.

Openings other than the air and drain scuppers are generally not permitted:

- in the platforms, at a distance not less than 1.5 times the cofferdam bulkhead thickness from the longitudinal bulkheads or side, which act as the platform supports;

- in the diaphragms, at the same distance from the inner bottom plating or the upper point of the bulkhead bottom trapezoidal stool, if any, and the upper deck plating or the lower point of the horizontal underdeck stiffener of rectangular or trapezoidal section, being the bulkhead top stool, if any, which act as the diaphragm supports.

Edges of the openings cut in the diaphragms and platforms located within $\frac{1}{4}$ of the span from their supports are to be reinforced with face plates or stiffeners. The distance between the edges of adjacent openings is to be not less than the length of these openings.

3.3.2.8 Transverse bulkheads with vertical corrugations are to have plane areas at ship’s sides not less than $0.08B$ in width. The upper ends of these bulkheads are to be attached to the deck by horizontal stiffeners of rectangular or trapezoidal section, complying with the requirements of 3.3.2.11, while the lower ends are to be attached directly to the inner bottom plating or to the stools of trapezoidal section fitted on the inner bottom, complying with the requirements of 3.3.2.10. The bulkheads in heavy cargo holds are to be supported by trapezoidal stools.

At lower end of corrugations there shall be fitted vertical and sloped plates so as to cover the concave portion of corrugations on each side of the corrugated bulkhead. The height of the covering plates in oil or bulk dry cargo carriers is not to be less than 0.1 of the corrugation span, and their thickness is to be not less than the lower strake thickness of the corrugation.

3.3.2.9 Where lower ends of vertical corrugations are attached directly to the inner bottom plating, floors the thickness of which is to be not less than that of the bottom strake of the corrugated bulkheads are to be aligned with transverse faces (those directed athwart the ship).

In this case, web plates (those directed along the ship) of rectangular corrugations are to be in line with inner bottom longitudinals or side girders. Side faces of trapezoidal corrugations are to be arranged so that in way of their intersection with inner bottom longitudinals hard spots are avoided.

3.3.2.10 The construction of the transverse bulkhead bottom trapezoidal stool is to comply with the following requirements:

1. The stool is fitted on the inner bottom athwart the ship under the bulkhead. It should consist of a top horizontal plate having a width not less than the height of the bulkhead corrugations and two sloped plates resting upon the plate floors. The height of the stool is not to exceed $0.15D$. Stools of greater height are subject to special consideration by the Register.

2. Inner bottom longitudinals are to be cut at the floors giving support to the sloped plates of the bottom stools and to be attached to them by brackets. Brackets having a thickness not less than that of the floors, reinforced with stiffeners are to be fitted between the floors in line with the inner bottom longitudinals.

3. Diaphragms are to be fitted inside the bottom stools in line with the centre girder and side girders. Drain and access holes may be cut in the diaphragms.
Size of the openings, their runforecement as well as stiffening of diaphragms should comply with similar requirements for the diaphragms of hopper side tanks, as specified in 3.3.2.4.

4. The horizontal and sloped plates inside the bottom stool are to be stiffened to form a ring structure, fitted in line with the inner bottom longitudinals.

3.3.2.11 The construction of the corrugated bulkhead top stool of rectangular or trapezoidal section is to comply with the following requirements:

1. The top stool is to be fitted under the deck athwart the ship, over the bulkhead. It should consist of a bottom horizontal plate having a width not less than the height of the bulkhead corrugations and two vertical or sloped plates. The height of the top stool is to be approximately equal to 0.1 of the distance between the topside tanks. The dimensions of the top stool are to be such as to provide access into that stool.

2. The horizontal and vertical (sloped) plates inside the stool are to be stiffened. The stiffeners may be fitted in line with the deck longitudinals forming ring structures with them. Horizontal stiffeners may be fitted. In this case, webs giving intermediate support to these stiffeners as well as brackets ensuring efficient end attachment of corrugations are to be provided inside the top stool.

3. Where an angle between the sloped plate of the top stool and a vertical axis exceeds 30°, brackets ensuring efficient upper end attachment of corrugations are to be fitted inside the top stool in line with plane faces of trapezoidal corrugations.

3.3.3 Design loads.

3.3.3.1 The design loads on the inner bottom members, sides and transverse bulkheads are to be calculated as required by 2.2.3, 2.4.3, 2.5.3 and 2.7.3 respectively, taking account of the heaviest of the anticipated bulk cargoes, liquid cargo (water ballast) or empty holds, whichever is appropriate.

3.3.3.2 The design pressure on the plating and framing of the hopper side tank sloped sides and of the plates of the transverse bulkhead bottom stools is to be determined as required by 1.3.4.3 for the heaviest of the anticipated bulk cargoes and as required by 1.3.4.2 for liquid cargo, whichever is appropriate. In any case, the design pressure need not be taken less than that determined by Formula (1.3.4.2-4) and for the trapezoidal stools also in accordance with 2.7.3.1.

3.3.3.3 The design pressure on the plating and framing of the topside tank longitudinal bulkheads and of the plates of the transverse bulkhead top stools of rectangular or trapezoidal section is to be determined as required by 1.3.4.2 for the holds filled with liquid cargo (water ballast). In any case, the design pressure need not be taken less than that determined by Formula (1.3.4.2-4) and for the top stools also in accordance with 2.7.3.1.

3.3.3.4 Where the hopper side and/or topside tanks, transverse bulkhead bottom and/or top stools, space inside the cofferdam bulkheads and/or inter-skin space are used as tanks, the design pressure is to be determined with regard for the pressure from the inside as required by 1.3.4.2.

3.3.4 Scantlings of structural members.

3.3.4.1 The scantlings of double bottom members are to satisfy the following requirements:

1. The scantlings of centre girder, side girders and floors are to be determined on the basis of strength calculation made for bottom grillages using design pressure stated in 3.3.3 and the following permissible stress factors:

   for centre girder and side girders
   \[ k_a = 0.3k_B \leq 0.6 \] in the midship region, when determining the shell platting stresses;
   \[ k_a = 0.35k_B \leq 0.6 \] in the midship region, when determining the inner bottom platting stresses;
   \[ k_a = 0.6 \] at the ship’s ends within 0.1L from the fore or after perpendicular.

   For regions between the midship region and the above portions of ship’s ends, \( k_a \) is to be determined by linear interpolation;

   for floors
   \[ k_a = 0.6; \]
   when the strength is verified using the shear stresses,
   \[ k_t = 0.6; \]
   \( k_B \) is to be obtained from Formula (2.2.4.1).

   Where combinations of empty and loaded holds are envisaged, this should be accounted for in the strength calculation made for the bottom grillage when determining the root flexibility factor of the centre girder and side girders on the bearing contour line of the grillage. Account may be taken of the end root flexibility of floors owing to rotational stiffness of the hopper side tanks. The grillage is to be treated as a system of cross members (structural idealization using beam models).

   For ships with single side skin, of 150 m in length and more, intending to carry cargoes having bulk density of 1.0 t/m³ and more, the strength of double-bottom structural components should be additionally verified in accordance with a special procedure, described in the Collection of Regulating Documents of the Register, for the case of each of the holds being flooded.

2. The section modulus of the bottom primary members is to be determined in accordance with 2.4.4.5 taking the following permissible stress factors:
for longitudinals
\( k_\sigma = 0.4k_B \leq 0.65 \) in the midship region;
\( k_\sigma = 0.65 \) at the ship’s ends within 0.1L from the fore or after perpendicular.

For regions between the midship region and the above portions of the ship’s ends, \( k_\sigma \) is to be determined by linear interpolation;

for transverse members
\( k_\sigma = 0.65; \)
\( k_B \) is to be determined by Formula (2.2.4.1).

3. The section modulus of inner bottom primary members is to be determined in accordance with 2.4.4.5 at the design pressure in accordance with 3.3.3 and the following permissible stress factors:

for longitudinals
\( k_\sigma = 0.5k_B \leq 0.75 \) in the midship region;
\( k_\sigma = 0.75 \) at the ship’s ends within 0.1L from the fore or after perpendicular.

For regions between the midship region and the above portions of the ship’s ends, \( k_\sigma \) is to be determined by linear interpolation;

for transverse members
\( k_\sigma = 0.75; \)
\( k_B \) is to be determined by Formula (2.2.4.1).

3.3.4.2 The scantlings of the hopper side tank members are to comply with the following requirements:

1. The thickness of the sloped bulkhead plating is not to be less than that determined by Formula (1.6.4.4) taking:
\( m = 15.8; \)
\( p \) = design pressure as defined in 3.3.3;
\( k_\sigma \) is to be taken as for the longitudinal bulkhead plating of tankers as required by 2.7.4.1, but not more than for the inner bottom plating in accordance with 2.4.4.4.1.

The bottom strake thickness of the tank sloped bulkhead is not to be less than that of the inner bottom plate adjacent to it. The thickness of other strakes, in mm, is not to be less than:

\[
s_{\min} = (7 + 0.035L) / \sqrt{\eta}, \tag{3.3.4.2}
\]

but not greater than the bottom strake thickness, where \( \eta \) is to be obtained from Table 1.1.4.3.
If \( L > 260 \) m, \( L = 260 \) m should be adopted.

Where the hold and/or tank is used for the carriage of oil, oil products or water ballast, the thickness is not to be less than required by 3.5.4.

2. The section modulus of primary members of the sloped bulkhead is not to be less than that determined in accordance with 1.6.4.1 and 1.6.4.2 taking:
\( p \) = design pressure as defined in 3.3.3;
\( m = 10 \) for transverse stiffeners;
\( m = 12 \) for longitudinal stiffeners;
\( k_\sigma \) is to be taken as for the bulkhead stiffeners of tankers as specified in 2.7.4.2, but not more than for the inner bottom primary members in accordance with 3.3.4.1.3.

The longitudinal stiffeners are to comply with buckling strength requirements, as specified in 1.6.5.2.

3. The thickness of the diaphragm plating is not to be less than that of the abutting plate floors. Stiffening of the diaphragms with openings is to comply with the requirements for stiffeners of the floors, as specified in 1.7.3.1.

The thickness of plating and the scantlings of the stiffening framing members of the watertight diaphragms are to comply with the requirements for the tank bulkheads as specified in 2.7.4.1 and 2.7.4.2.

3.3.4.3 Where the frame ends are attached directly to the sloped bulkheads of tanks (without transition horizontal area), the section modulus at support section \( W_{sup} \), in cm³, is to be not less than:

\[
W_{sup} = W_0 / \cos^2 \alpha
\]

where \( W_0 \) = section modulus at the frame support section as required by 2.5.5.1, in cm³;
\( \alpha \) = slope angle of the tank bulkhead to the base line, in deg.

3.3.4.4 The scantlings of the frames are to be in accordance with the requirements of 2.5.4.1 and with those given below.

1. The thickness of frame webs \( s_{w \ min} \), in mm, is not to be less than:
\[
s_{w \ min} = k(7 + 0.03L),
\]

where \( k = 1.15 \) for frame webs in way of the foremost hold;
\( k = 1.0 \) for frame webs in way of other holds.

Where \( L > 200 \) m, \( L = 200 \) m is to be taken equal to 200 m.

2. The thickness of the bracket connecting the lower end of frame to the bilge tank is not to be less than that of the frame web or \( s_{w \ min} + 2 \) mm, whichever is greater. The thickness of the bracket connecting the upper end of frame to the underdeck tank is not to be less than that of the frame web.

3. The section modulus of the frame and bracket or integral bracket, and associated shell plating, is not to be less than twice the section modulus required for the frame midspan area.

3.3.4.5 The scantlings of the topside tank members are to comply with the following requirements:

1. The plating thickness of the vertical and sloped bulkheads of the topside tank is not to be less than determined by Formula (1.6.4.4) taking:
\( m = 15.8; \)
\( p \) = design pressure as defined in 3.3.3;
\( k_\sigma \) is to be taken as for the longitudinal bulkhead plating of tankers as specified in 2.7.4.1.
The thickness, in mm, of the vertical bulkhead plating and of the adjoining sloped bulkhead plate is not to be less than:

\[ s_{\text{min}} = 10 + 0.025L \]  \hspace{1cm} (3.3.4.5)

Where \( L > 200 \) mm, \( L \) is to be taken equal to 200 m.

The thickness of other sloped bulkhead plates is to be not less than that determined by Formula (2.7.4.1-2). Where the hold and/or tank is used for the carriage of oil, oil products or water ballast, the thickness is to be not less than that required by 3.5.4.

.2 The section modulus of longitudinal stiffeners of the vertical and sloped bulkheads is not to be less than that determined according to 1.6.4.1 and 1.6.4.2 taking:

- \( p \) = design pressure as defined in 3.3.3, but not less than 25 kPa;
- \( m = 12 \);
- \( k_\alpha \) is to be taken as for horizontal stiffeners of longitudinal bulkheads of tankers as specified in 2.7.4.2.

The longitudinal stiffeners of the vertical and sloped bulkheads are to comply with buckling strength requirements of 1.6.5.2.

.3 The section modulus of the transverse web of the sloped bulkhead is to be not less than that determined in 1.6.4.1 and 1.6.4.2, and the sectional area of the web plate is not to be less than that determined in accordance with 1.6.4.3 taking:

- \( N_{\text{max}} = 0.5pdh \);
- \( p \) = design loading as defined in 3.3.3, but not less than 25 kPa;
- \( m = 10 \);
- \( k_\alpha = k_\zeta = 0.75 \).

.4 The section modulus and sectional area of the deck transverse web inside the tank is to comply with the requirements of 2.6.4.6.

The section modulus and sectional area of the side transverse web inside the tank is to comply with the requirements of 2.5.4.5 at \( m = 10 \).

The section modulus and sectional area of vertical web plate of the tank vertical bulkhead is to be calculated as the mean of these values for the deck transverse and transverse web of the sloped bulkhead.

.5 The plate thickness of bulkheads inside the tanks fitted in line with the hold transverse bulkheads is not to be less than that of the latter at the same distance from the inner bottom plating. Stiffening of bulkhead plating is to comply with the requirements of 2.7.4.2 for the tank primary members.

.6 The thickness of brackets stiffening the tank vertical bulkhead and of brackets fitted at the lower corner of the tank is not to be less than 10 mm.

3.3.4.6 In any case, the hold bulkhead plating and corrugations are to have a thickness not less than 10 mm.

The height of top rectangular (trapezoidal) stool, bottom trapezoidal stool and of double bottom is not included in the span of the hold bulkhead vertical corrugations.

3.3.4.7 The scantlings of the transverse bulkhead lower trapezoidal stool members are to comply with the following requirements:

.1 The thickness of the horizontal and sloped plate is not to be less than that determined by Formula (1.6.4.4) taking:

- \( m = 15.8 \);
- \( p \) = design pressure as defined in 3.3.3;
- \( k_\alpha = 0.9 \).

The thickness of horizontal plate and top strake of the sloped plate is not to be less than that of the corrugation adjoining the stool. The thickness of the bottom strake of the sloped plate is not to be less than that of the inner bottom plating. The thickness of other strakes of the sloped plate is not to be less than that determined by Formula (3.3.4.2). Where the hold and/or stool is used for the carriage of oil, oil products or water ballast, the thickness is to be not less than that required by 3.5.4.

.2 The section modulus of the sloped plate stiffeners is not to be less than that determined in accordance with 1.6.4.1 and 1.6.4.2 taking:

- \( p \) = design pressure as defined in 3.3.3;
- \( m = 10 \);
- \( k_\alpha = 0.75 \).

The section modulus of the horizontal plate stiffeners is not to be less than that of the sloped plate stiffeners.

.3 The thickness of diaphragm is not to be less than that of side girders. Size of the openings cut in diaphragms and their reinforcement are to comply with the requirements for openings and reinforcement of the hopper side tank diaphragms as specified in 3.3.4.2.3.

3.3.4.8 The scantlings of the transverse bulkhead top rectangular or trapezoidal stool members are to comply with the following requirements:

.1 The thickness of the horizontal and vertical (or sloped) plates is not to be less than that determined by Formula (1.6.4.4) taking:

- \( m = 15.8 \);
- \( p \) = design pressure as defined in 3.3.3;
- \( k_\alpha = 0.9 \).

The thickness of the horizontal plate and bottom strake of the vertical (sloped) plate is not to be less than that of the corrugation adjoining the top stool. Where the vertical plate is fitted in line with the hatch end coaming, its thickness is not to be less than that of this coaming as required by 3.3.4.11. The top strake of the sloped plate is to have the same thickness provided that its upper edge is at a distance of less than 0.4 m from the hatch end coaming. In any case, the thickness of the
vertical or sloped plate is not to be less than that determined by Formula (2.7.4.1-2). Where the hold
and/or interior of the top stool is used for the carriage of oil, oil products or water ballast, the thickness is not
to be less than that required by 3.5.4.

2 The section modulus of the stiffeners of vertical or sloped plate is not to be less than that
determined according to 1.6.4.1 and 1.6.4.2 taking:
   \[ p = \text{design pressure as defined in 3.3.3, but not less than } 25 \text{ kPa.} \]
   \[ m = 12 \text{ for horizontal stiffeners;} \]
   \[ m = 10 \text{ for other stiffeners;} \]
   \[ k_a = 0.75. \]

   The section modulus of the stiffeners of horizontal plate is not to be less than that of the stiffeners of vertical or sloped plate.

3 The section modulus of the vertical or sloped plate web to be fitted where horizontal stiffeners are
provided, as stated in 3.3.2.11.2, is not to be less than that determined from 1.6.4.1 and 1.6.4.2, while the
sectional area of the web plate is not to be less than determined according to 1.6.4.3 taking:
   \[ N_{\text{max}} = 0.5 p a l; \]
   \[ p = \text{design loading as defined in 3.3.3, but not less than } 25 \text{ kPa;} \]
   \[ m = 10; \]
   \[ k_a = k_c = 0.75. \]

   The section scantlings of webs fitted on the horizontal plate and under the deck are not to be less
than those required for the vertical (sloped) plate web.

4 The thickness of the brackets fitted inside the top stool to ensure efficient upper end attachment of
corrugations is not to be less than that of these corrugations in the upper part of the bulkhead.

3.3.4.9 The scantlings of the cofferdam bulkhead members are to comply with the following requirements:

1 The thickness of the cofferdam bulkhead plating is not to be less than that determined by
   Formula (1.6.4.4) taking:
   \[ m = 15.8; \]
   \[ p = \text{design pressure as defined in 3.3.3;} \]
   \[ k_a = 0.9. \]

   The plating thickness is not to be less than that determined from Formula (2.7.4.1-2) or according to
   3.3.4.6, whichever is the greater. Where the hold or interior of the cofferdam bulkhead is used for the carriage of oil, oil products or water ballast, the plating thickness is to be not less than that required by 3.5.4.

2 The section modulus of primary members stiffening the plating of cofferdam bulkheads is not to
   be less than that determined from 1.6.4.1 and 1.6.4.2 taking:
   \[ p = \text{design pressure as defined in 3.3.3, but not less than } 25 \text{ kPa;} \]
   \[ m = 12; \]
   \[ k_a = 0.75. \]

3 Where the construction of the cofferdam bulkhead incorporates only diaphragms or only
   platforms, their section modulus is not to be less than that determined from 1.6.4.1 and 1.6.4.2, and
   the sectional area is not less than that determined from 1.6.4.3 taking:
   \[ N_{\text{max}} = 0.5 p a l \text{ for platforms,} \]
   \[ N_{\text{max}} = 0.65 p a l \text{ for diaphragms;} \]
   \[ p = \text{design loading as defined in 3.3.3, but not less than } 25 \text{ kPa;} \]
   \[ l = \text{span, in m, equal to:} \]
   \[ \text{for diaphragms — the distance between the deck plating and inner bottom plating, at the centreline;} \]
   \[ \text{for platforms — the ship’s breadth in way of construction bulkhead for ships having single skin side construction, the distance between the inner skins for ships having double skin side construction;} \]
   \[ m = 10; \]
   \[ k_a = k_c = 0.75. \]

4 Where the construction of the cofferdam bulkhead consists both the diaphragms and platforms, their thickness is to be determined on the basis of the calculation of the grillage as a system using beam models, with the loading specified in 3.3.3 but not less than 25 kPa and the permissible stress factors
   \[ k_a = k_c = 0.75. \]

5 In any case, the thickness of the cofferdam bulkhead diaphragms and platforms is not to be less
   than that determined by Formula (2.5.4.8). Where the interior of the cofferdam bulkhead is used as a
   fuel oil or ballast tank, the thickness of the diaphragms and platforms is not to be less than that
   required by 3.5.4.

6 Stiffening of the diaphragms and platforms is to comply with the requirements of 1.7.3.2.2.

7 The thickness of tight portions of the diaphragms and platforms and their stiffeners are to comply with the requirements of 2.7.4.1 and
   2.7.4.2 for tank bulkheads.

8 Cross ties between the primary members strengthening the cofferdam bulkhead plating are to
   comply with the requirements for the double bottom intermediate struts, as specified in 2.4.4.7 with the design pressure determined according to 3.3.3, but not less than 25 kPa.

   Where cross ties are fitted, the section modulus of the primary members, as specified in 3.3.4.9.2, may be reduced by 35 per cent.

3.3.4.10 For ships with single side skin, of 150 m in length and more, intending to carry cargoes having
   bulk density of 1.0 t/m³ and more, the strength of transverse, watertight, vertically corrugated bulk-
   heads should be additionally verified in accordance with a special procedure, described in Collection of
Regulating Documents of the Register, for the case of each of the holds being flooded.

3.3.4.11 The thickness of the hatch coamings is not to be less than that determined by Formula (3.3.4.4).

The thickness of the hatch side coamings, in mm, is not to be less than:

\[ s = 17a \]

where \( a \) = vertical distance between horizontal stiffeners on coaming plate or between the lower stiffener and the deck plating, in m.

Stiffening of the coaming plates is to comply with the requirements of 1.7.3.2. The thickness of coaming plate stiffeners and brackets is not to be less than 10 mm.

The width of the coaming face plate is to comply with the requirements of 1.7.3.1.

3.3.4.12 The thickness of single-side shell plating located between hopper and upper wing tanks is not to be less than \( s_{min} \), in mm, given by:

\[ s_{min} = \sqrt{L}. \]

3.3.5 Special requirements.

3.3.5.1 Provision is to be made for an efficient corrosion protection coating (epoxy coating or equivalent) for all internal surfaces of the cargo holds, excluding the flat tank top areas and the hopper tanks sloping plating, approximately 300 mm below the toe of frame brackets and for all internal and external surfaces of hatch coamings and hatch covers. In the selection of coating due consideration is to be given to intended cargo conditions expected in service.

3.3.5.2 The longitudinal strength of ships with single side skin, of 150 m in length and more, intending to carry cargoes having bulk density of 1.0 t/m³ and more, is to be verified for the case of each cargo hold being flooded as a result of hull damage, in each of the cargo and ballast conditions considered in the intact longitudinal strength calculations.

The actual hull girder bending stress \( \sigma_{fbd} \), in MPa, is determined by the formula

\[ \sigma_{fbd} = \frac{M_{sw}^{fd} + 0.8M_{w}}{W} 10^5, \]

where \( M_{sw}^{fd} \) — still water bending moment, in kN m, in the flooded conditions for the section under consideration;

\( M_{w} \) — wave bending moment, in kN m, in accordance with 1.4.4.1 for the section under consideration;

\( W \) — actual section modulus, in cm², for the corresponding location in the hull girder.

The actual hull girder shear stress \( \tau_{fbd} \), in MPa, is determined by the formula

\[ \tau_{fbd} = \frac{N_{sw}^{fd} + 0.8N_{w}}{2s} \frac{S}{I} 10^3, \]

where \( N_{sw}^{fd} \) — still water shear force, in kN, in flooded condition for the section under consideration;

\( N_{w} \) — wave shear force, in kN, in accordance with 1.4.4.2 for the section under consideration;

\( I \), \( S \) — as defined in 1.4.2;

\( s \) — thickness of plating, in mm.

The ship strength analysis in damaged condition is to demonstrate that the actual hull girder bending stresses do not exceed 175/\( \eta \), in MPa, and the actual shear stresses do not exceed 110/\( \eta \), MPa.

To carry out an analysis of damaged ship strength, the following assumptions are to be made:

The damaged structure is assumed to remain fully effective in resisting the applied loading.

Each cargo hold is to be considered individually flooded up to the equilibrium waterline. Position of the waterline and the volume of ingressed water are determined on the basis of damaged trim calculations which are to be made in accordance with a program approved by the Register.

"Permeability" for solid bulk cargo means the ratio of the floodable volume between the particles, granules or any larger pieces of the cargo, to the gross volume of the bulk cargo.

The permeability of empty cargo spaces and volume left in loaded cargo spaces above any cargo is to be taken as 0.95.

Appropriate permeabilities and bulk densities are to be used for any cargo carried. For iron ore, a minimum permeability of 0.3 with a corresponding bulk density of 3.0 t/m³ is to be used. For cement, a minimum permeability of 0.3 with a corresponding bulk density of 1.3 t/m³ is to be used.

For packed cargo conditions (such as steel mill products), the actual density of the cargo should be used with a permeability of zero.

3.3.6 Strength control during ship loading.

3.3.6.1 Bulk carriers, ore carriers and combination carriers of 150 m length and more are to be provided with an approved loading manual and the Register-approved loading instrument of an approved type.

3.3.6.2 Loading manual is a document approved by the Register, which describes:

a) the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moments and shear forces;

b) the results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional loads;

c) for single skin bulk carriers, envelope results and permissible limits of still water bending moments and shear forces in the hold flooded condition according to 3.3.5.2;

d) the cargo holds or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual;
e) maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position;

f) maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions;

g) maximum allowable tank top loading together with specification of the nature of the cargo (density or stowage factor) for cargoes other than bulk cargoes;

h) maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual;

i) the maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

In addition to the requirements given in 1.4.3.1.1, the following conditions, subdivided into departure and arrival conditions as applicable, are to be included in the loading manual:

a) alternate light and heavy cargo loading conditions at maximum draught, where applicable;

b) homogeneous light and heavy cargo loading conditions at maximum draught;

c) ballast conditions. For ships having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty. Partial filling of the peak tanks is not acceptable in the design ballast conditions, unless effective means are provided to prevent accidental overfilling;

d) short voyage conditions where the vessel is to be loaded to maximum draught but with limited amount of bunkers;

e) multiple port loading/unloading conditions;

f) deck cargo conditions, where applicable;

g) typical loading sequences where the vessel is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions shall also be included. The typical loading/unloading sequences shall also be developed to not exceed applicable strength limitations. The typical loading sequences shall also be developed paying due attention to loading rate and the deballasting capability;

h) typical sequences for change of ballast at sea, where applicable.

3.3.6.3 A loading instrument is an approved digital system as defined in 1.4.9.4. In addition to the requirements in 1.4.9.4, it shall ascertain as applicable that:

a) the mass of cargo and double bottom contents in way of each hold as a function of the draught at mid-hold position;

b) the mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds;

c) the still water bending moment and shear forces in the hold flooded conditions according to 3.3.5.2;

d) acceptance of limits for mass of cargo and double bottom contents of any two adjacent holds as a function of draught.

3.4 ORE CARRIERS AND ORE OR OIL CARRIERS

3.4.1 General.

3.4.1.1 The requirements of this Chapter apply to ships for the carriage of ore and other bulk cargoes, as well as to combination carriers for transportation of ore and oil (petroleum products).

3.4.1.2 The requirements for structures not mentioned in this Chapter are to be as stated in Sections 1 and 2, having regard to those contained in 3.3 as regards structures exposed to the loads from heavy dry bulk and liquid cargoes.

In any case, the requirements for the hull and its structures are not to be less stringent as those of Sections 1 and 2.

3.4.1.3 The basic structural type of a ship is considered to be a single deck ship, with machinery aft, having longitudinal bulkheads separating the centre ore compartment from the wing tanks and a double bottom throughout the entire breadth of the ship or the centre part between the longitudinal bulkheads.

3.4.2 Construction.

3.4.2.1 The deck and bottom (double bottom) are to be longitudinally framed. The side shell and longitudinal bulkheads may, in general, be framed either longitudinally or transversely. Deck plating between end coamings of adjacent cargo hatches is to be strengthened by transverse stiffeners as required by 3.3.2.1.
Transverse bulkheads may be plane with stiffeners arranged vertically, corrugated with vertical corrugations or of a cofferdam type.

3.4.2.2 Floors in the centre hold and in the wing tanks are to be aligned and to form, in conjunction with side transverses, vertical webs of longitudinal bulkheads and deck transverses, a single transverse ring structure.

3.4.2.3 Where transverse bulkheads in the wing tanks are not aligned with centre hold bulkheads, transverse ring structures are to be fitted in line with the latter bulkheads.

In this case, provision is to be made in the wing tanks for a smooth tapering of the sloped bulkheads of trapezoidal stools fitted under centre hold bulkheads.

3.4.2.4 Longitudinal bulkheads are, in general, to be plane with horizontal or vertical stiffening.

Longitudinal bulkheads may be slightly sloped or to have a knuckle.

3.4.2.5 Where a double bottom in wing tanks is omitted, floors are to be backed by substantial knees or brackets fitted in line with the inner bottom plating of the centre hold.

3.4.2.6 Diaphragms should be fitted in line with the longitudinal bulkheads inside the bottom trapezoidal stools and top stools of rectangular or trapezoidal sections. The diaphragms of the bottom stools are to comply with the requirements of 3.3.2.10.3, the diaphragms of the top stools — with the requirements for the topside tank bulkheads as specified in 3.3.2.3.

3.4.3 Design loads.

3.4.3.1 The design pressure on the centre hold boundary structures is to be determined according to 1.3.4.3 assuming that the centre hold is loaded with ore or other heavy bulk cargo.

3.4.3.2 Structures which are likely to be subjected to one-sided pressure of a liquid cargo (ballast water) are to be examined for the design pressure of the liquid cargo as required by 1.3.4.2.

3.4.4 Scantlings of structural members.

3.4.4.1 The scantlings of structural members of the cargo spaces intended only for the carriage of bulk cargoes or bulk cargoes and oil, oil products or water ballast are to comply with the requirements of Section 2 and 3.4.

The scantlings of structural members of the cargo spaces intended only for the carriage of oil, oil products or water ballast are to comply with the requirements of Section 2 and 3.5.4.

3.4.4.2 The scantlings of longitudinal bulkhead members are to comply with the requirements of 2.7.4 at the design pressure defined in 3.4.3.

In any case, the thickness of longitudinal bulkhead plating is not to be less than that required by Formula (3.3.4.5) or, where oil, oil products or water ballast is carried in any compartment bounded by that bulkhead, it is to be not less than that required by 3.5.4, whichever is the greater.

3.4.4.3 The scantlings of structural items of diaphragms of transverse bulkhead bottom trapezoidal stool, fitted in line with the longitudinal bulkheads, are to comply with the requirements of 3.3.4.7.3.

3.4.4.4 The scantlings of structural items of diaphragms of transverse bulkhead top stool, fitted in line with longitudinal bulkheads, are to comply with the requirements of 3.3.4.5.5 for the transverse bulkheads inside the topside tanks.

3.5 TANKERS

3.5.1 General.

The requirements of this Chapter apply to tankers, as well as to oil recovery ships, as applicable, with machinery aft, having a single or a double bottom arrangement and one, two or three longitudinal bulkheads. Hull structural members of tankers not covered by this Chapter are to comply with the requirements of Sections 1 and 2.

3.5.2 Structural configuration.

3.5.2.1 The scantlings of the cofferdams are to be determined according to 2.7.5.2.

3.5.2.2 Longitudinal corrugated bulkheads are permitted in ships under 180 m in length.

Longitudinal corrugated bulkheads are to have horizontally arranged corrugations, and their upper and lower strakes for 0.1D from the deck and bottom, respectively, are to be plane.

In way of connections between longitudinal and transverse bulkheads, continuity of strength is to be maintained at the top and bottom strakes of the longitudinal bulkheads.

3.5.2.3 The deck and bottom in the cargo tank region are to be framed longitudinally, for the side shell and longitudinal bulkheads, longitudinal or transverse framing may be adopted. The deck and bottom of ships under 80 m in length may be transversely framed. It is recommended that longitudinal framing be used for side shell and longitudinal bulkheads of ships over 180 m in length. Where the longitudinal framing is adopted, spacing of transverse members is to correspond to that of bottom transverses (see 2.3.2.4 and 2.4.2.5).

3.5.2.4 The longitudinal scantlings of deck, bottom, side shell and longitudinal bulkheads within the midship portion of the ship are not to vary. Structural continuity of the above longituindals is to be ensured within 0.1D from deck and bottom.

In ships of 150 m in length and more, the above longitudinals are to pass through the transverse bulkheads without cutting.
3.5.2.5 The primary supporting members (bottom centreline girder, side girders, vertical webs on bulkheads, deck centreline girder, continuous deck girders, side and bottom transverses, side stringers and bulkhead horizontal girders) in way of cargo tanks are to form a transverse ring structure, whenever possible.

3.5.2.6 Hull structural members are to be interconnected as required by 1.7.2. The webs of primary supporting members are to be supported by horizontal or vertical stiffeners in accordance with 1.7.3.2. The inertia moment of stiffeners is to comply with 1.6.5.6.

3.5.3 Design loads.

Unless provided otherwise in this Chapter, the design loads on hull structures of tankers are to be taken according to 1.3 and relevant chapters of Section 2.

3.5.4 Scantlings of structural members.

The scantlings of structural members of tankers are to be determined in compliance with Section 2, having regard to the provisions of this Chapter.

The thickness $s_{min}$ in mm, of structural members, forming the boundaries of cargo and ballast tanks as well as members fitted inside these tanks is not to be less than:

$$s_{min} = 5.5 + 0.035L \text{ for } L < 80 \text{ m};$$

$$s_{min} = 6.7 + 0.02L \text{ for } L \geq 80 \text{ m}.$$

Where $L > 290$ m, $L$ is to be taken as equal to 290 m. In this case, the minimum thickness of the primary members need not exceed 11.5 mm.

3.5.5 Special requirements.

3.5.5.1 The number of openings for access to cofferdams, pump rooms, cargo and ballast tanks is to be kept to the minimum required. They are to be as far distant as practicable from end bulkheads of superstructures. Hatches to wing tanks in line with a centre tank hatch in the athwart direction are not permitted.

Hatch openings are to be either circular or elliptical in shape, the elliptical openings having the major axis fore and aft. Structural continuity of deck girders and longitudinals is to be maintained. The thickness of cargo hatch coamings less than 750 mm high is to be 10 mm, while coamings 750 mm and more in height are to have a thickness equal to 12 mm. Coamings more than 750 mm in height, provided they are more than 1.25 m long, are to be stiffened.

3.5.5.2 Guard rails, bulwark, gangway or an equivalent arrangement are to be fitted in compliance with 8.6 of Part III "Equipment, Arrangements and Outfit".

The gangway, if fitted, is not to contribute to hull longitudinal bending.

3.6 VESSELS OF DREDGING FLEET

3.6.1 General.

3.6.1.1 The requirements of this Chapter apply to the hulls of the vessels of dredging fleet and floating cranes. Areas where such ships operate and/or transport spoil are called work areas. The transfer of the ship from one work area to another is called a voyage.

3.6.1.2 As to their purpose, vessels of dredging fleet are to be defined as follows:

Dredgers are self-propelled or non-self-propelled ships designed to operate for the purpose of raising the soil (silt, sand, gravel, clay, etc.) using any dredging gear (buckets, suction pipes, grabs, etc.) and having no spaces where the soil may be stored or transported.

Hopper dredgers are self-propelled ships having dredging gear for raising the soil and one or two hoppers where the spoil may be stored or transported.

Hopper barges are self-propelled or non-propelled ships designed only for transportation of the soil, but having no dredging gear. They can be single-hulled or double-hulled capable of opening.

Floating cranes are self-propelled or non-self-propelled ships having an upper structure and designed for cargo handling in work areas.

3.6.1.3 The basic structural configuration of a vessel of dredging fleet, considered in this Chapter, is a single-deck vessel with ordinary ship lines or of a pontoon shape, having a ladder well or other hull cut-outs.

The pontoon hull shape may be used only in vessels of restricted service II, II PII, III CII and III according to Part I "Classification".

Use of a pontoon hull in vessels of restricted service I and of unrestricted service is to be specially considered by the Register.

3.6.1.4 The requirements of this Chapter apply to dredgers, single-hulled and opening double-hulled hopper dredgers and hopper barges, floating cranes having ship-hull or pontoon shape.

3.6.1.5 In opening hopper dredgers and hopper barges, subject to the Register's supervision are deck and deckhouse hinges, hydraulic presses and their hull connections as well as longitudinal and transverse structures between the hulls and deckhouses.

3.6.1.6 Symbols:

$\text{d}_1 =$ maximum dredging draught, in m, at which the vessel is designed to operate;

$\text{d}_2 =$ draught during sea voyage, in m;

$\Delta =$ displacement at the draught $\text{d}_1$ or $\text{d}_2$, in t;

$\Delta_s =$ light-ship displacement without spoil mixture, in m;

$\Omega =$ mid-section area corresponding to the draught $\text{d}_1$ or $\text{d}_2$, in m$^2$;

$l_h =$ full length of the hopper, in m;
\[ h_{1,cr} = \text{depth of a hopper lower cross-member, in m;} \]
\[ l_{1,cr} = \text{hopper lower cross-member span measured at mid-depth between longitudinal bulkheads of the hopper, in m;} \]
\[ H_1 = \text{distance from the mid-depth of the hopper lower cross-member to the deck at side, in m;} \]
\[ H_2 = \text{distance from the base line to the upper edge of the coaming, in m;} \]
\[ h_c = \text{coaming height above the deck line at side, in m;} \]
\[ B_2 = \text{distance between the side shell and the longitudinal bulkhead at mid-depth of a hopper lower cross-member, in m;} \]
\[ B_3 = \text{distance between the side shell and the longitudinal bulkhead at the deck level, in m;} \]
\[ Q_i = \text{maximum mass of the spoil mixture in the hopper, in t;} \]
\[ \rho_s = \text{density of spoil mixture, defined as a ratio of the spoil mass in the hopper at the maximum draught to the hopper volume up to the level of overflow or to the upper edge of the hopper coaming where there is no overflow, in t/m}^3; \text{ it is not to be taken more than 1.8; } \]
\[ A_{k,k}, A_{1,cr} = \text{areas enveloped in the contour of the centre line box keel, hopper lower cross-member, respectively, in m}^2; \text{ where the centre line keel and/or a hopper lower cross-member are an ordinary girder (web with a face plate), it is assumed that } A_{k,k}; \]
\[ k = A_{1,cr} = 0; \]
\[ b_{k,k} = \text{centre line box keel width at lower portion, in m;} \]
\[ b_d = \text{bottom breadth from the side shell to the point of intersection of the hopper longitudinal bulkhead with the bottom, in m;} \]
\[ b_{g,c} = \text{width of the coaming upper face plate, in m;} \]
\[ a = \text{spacing of frames, hopper side stiffeners, longitudinals, in m;} \]
\[ b = \text{spacing of transverse ring structures, in m;} \]
\[ l_1, l_2 = \text{length of the upper and lower face plate of the hopper lower cross-member, measured from the hopper longitudinal bulkhead to the centre line box keel, in m;} \]
\[ R_{up,cr}, R_{cr} = \text{axial force acting on the hopper upper and lower cross-member, respectively, in kN;} \]
\[ N = \text{design axial force, in kN;} \]
\[ \Delta_s = \text{corrosion allowance, in mm, for plate thickness (see 1.1.5.1);} \]
\[ \omega = \text{factor taking corrosion allowance into account with regard to the section modulus of members (see 1.1.5.3).} \]

Some of the symbols are shown in Fig. 3.6.1.6.

3.6.2 Construction.

3.6.2.1 Main hull structures are to comply with the requirements of Section 2, having regard to the provisions and additions given in this Chapter.

Referred to the particular structures of vessels of dredging fleet are:

hopper longitudinal and transverse bulkheads;
hopper lower and upper cross-members;
centre line box keels, hopper coamings;
diaphrags and transverse ring structures in buoyancy spaces (see 3.6.2.11).

For floating cranes strengthening is to be provided of the pontoon hull beneath the fixed crane tower supporting the upper crane structure, this strengthening including the crane tub, the bulkhead cross and the bearing contour (Fig. 3.6.2.1). Other construction of the pontoon strengthening in way of the tower is to be specially considered by the Register.

3.6.2.2 Shell plating:

.1 Corners of hopper and well openings in the bottom plating are to be rounded and insert plates, the dimensions of which are to be approved by the Register, are to be fitted at the corners.

.2 The cutting of overflow discharge trunk openings in the sheerstrake is to be avoided wherever practicable. Where such openings cannot be dispensed with, their upper edge is not to be within 800 mm of the deck line at side. They are to have corner radii of not less than 150 mm.

.3 Angular connection of the side shell plating or longitudinal bulkhead of the well with the bottom plating is to be made by means of section steel (rod, bar).

3.6.2.3 Single bottom:

.1 The bottom centre girder in way of the hopper and well of hopper dredgers is not to be fitted.

.2 The depth of floors abreast of hoppers in hopper dredgers and barges with transverse framing and abreast of dredging wells in hopper dredgers is not to be less than \( h_{1,cr} / B_1 \).
The breadth $B_t$ is taken:
in way of the hopper, equal to the breadth of the vessel after deducting the breadth of the hopper at bottom, but not less than $0.6B$; in way of the well, equal to the breadth of the vessel after deducting the breadth of the well.

3. Side girders are to be fitted in side buoyancy tanks of hopper dredgers and hopper barges where the tank width between the vessel’s side and the longitudinal bulkhead exceeds 3.5 m in transversely framed vessels, and 4 m in longitudinally framed vessels.

Side girders in opening hopper barges may be omitted.

4. In the pump rooms of hopper dredgers, the bottom framing should be identical to that of the engine room.

In the area where soil pumps are located, the depth of floors and side girders may be reduced with the required section modulus and web area being maintained. Otherwise a calculation proving the strength of the bottom grillage in the region concerned is to be submitted to the Register.

5. In floating cranes plate floors are to be fitted at every frame within $0.2L$ from the forward perpendicular over the entire breadth of the hull and additional bottom transverses or longitudinals spaced not more than 0.35 m apart are to be fitted.

3.6.2.4 Double bottom:

1. In lieu of the bottom centre girder, two side girders may be fitted on each side of ship’s centre line at a distance not exceeding 1 m from each other and passing into the webs of the centre line box keel or into the well sides (Fig. 3.6.2.4.1).

2. Additional side girders extending over a distance of not less than three spacings from the end of the bracket are to be fitted in the double bottom under the lower brackets of longitudinal bulkheads of the hopper space or the well and under the brackets of the centre line box keel.

3.6.2.5 Side framing:

1. In floating cranes, hopper dredgers designed to work in conjunction with hopper barges, and in hopper barges, the side framing is to be reinforced as follows:

   two rows of efficient fenders, one fitted at the deck level or 200 mm below it, the other 200 — 300 mm above the lowest operating waterline amidships;

   the upper and lower fenders in hopper dredgers are to be connected by vertical fenders fitted in line with frames;

   it is recommended that a side stringer required by 2.5.4.4 which is to be taken into account in determining the scantlings of the frames or an intercostal side stringer be fitted at a level of the lower fenders.

2. In floating cranes the strengthening of the side framing within $0.2L$ from the forward perpendicular is to comply with the requirements of 3.6.2.8. Web frames are to be spaced not more than four spacings apart.

3. In floating cranes, intermediate frames of the same scantlings as the main frames are to be fitted in the fore peak and in areas extending forward for $0.1L$ from the stern transom and inboard for $0.1B$ over the entire depth.

The extension and end attachments of intermediate frames are to comply with the requirements of 3.10.

3.6.2.6 Decks and platforms:

1. Corners of openings in the deck plating in way of the hopper and the well are to be rounded. Insert plates, the dimensions of which are to be approved by the Register, are to be fitted at the corners.
.2 In hopper side buoyancy spaces, the hopper lower cross members are to be fitted in line with the web frames unless partial bulkheads are fitted.

3.6.2.7 Watertight bulkheads:

.1 Bulkheads forming the ends of the hopper are to extend from side to side.

.2 In bucket dredgers, protective bulkheads are to be provided parallel to the well sides at a distance of not less than 600 mm from them.

The extension of protective bulkheads is to be such as to prevent the ship from flooding in case of damage to the shell plating by objects brought up in the dredge buckets.

A protective bulkhead is to be also provided at the end of the well. The scantlings of framing members and the plating thickness of the protective bulkheads are to be determined as for permanent watertight bulkheads of dry cargo ships. The framing inside the cofferdam formed by the well side and the protective bulkhead may consist of brackets with openings cut therein. Cofferdams are to have access openings for maintenance.

.3 Bulkheads forming the ladder well in hopper dredgers are to be protected against possible damage by the ladder when moved.

.4 Longitudinal bulkheads of the hopper and well sides are to terminate at deck and bottom in brackets. The length of the arms of the brackets is not to be less than 0.25D and their thickness is not to be less than the plating thickness of the longitudinal bulkhead. The brackets are to be strengthened with stiffeners and to have a face plate over the free edge. The top bracket is to be extended by a deck girder, the bottom bracket by a side girder for at least three spacings beyond the bracket end.

.5 In floating cranes the bulkheads forming the cross are to be rigidly connected with the bulkheads forming the bearing contour. These bulkheads are to be carried to the nearest transverse and longitudinal bulkheads (sides, transoms).

3.6.2.8 In ships with a pontoon shape of the forward and after ends, the following structural requirements are to be fulfilled:

.1 The fore and after peak bulkheads are to be fitted at a distance of 0.1L from the forward and after transoms, but not less than one spacing from the line connecting the raked part and flat of the bottom.

.2 Frame spacing in peaks is to be not more than 550 mm.

.3 The bottom framing within 0.15L from the forward and after perpendiculars is to consist of plate floors fitted at every frame, with side girder spaced not more than 1 m apart.

The scantlings of floors and side girders are to be determined as for the midship region.

.4 The side framing within 0.2L from the forward and after perpendiculars is to be strengthened with web frames and side stringers.

The web frames are to be fitted not more than three or four spacings.

The side stringers are to be fitted so that the distance between the side stringers measured over the vessel's side in way of the floor nearest to the fore peak bulkhead, the distance from the side stringer to the upper edge of the floor, as well as from the side stringer to the deck is not more than 2 m.

The scantlings of main frames fitted between the web frames are to comply with the requirements of 3.6.4.7 as for the midship region where side stringers are not provided.

The side stringers are to have the same scantlings as the web frames and to terminate at the bulkhead or at the web frame (see 2.5.4.7.2).

Construction and end attachments of the web frames are to comply with the requirements of 2.5.5.

.5 The transom bulkheads are to be strengthened with vertical stiffeners spaced not more than 0.5 m apart, and with horizontal girders arranged at the side stringer level.

Vertical webs are to be fitted in line with side girders. The scantlings of the vertical webs and horizontal girders are to be the same as those of web frames and side stringers in the fore peak. The scantlings of vertical stiffeners are to be the same as those of the frames. The attachments of stiffener ends with brackets are to comply with the requirements of 2.7.2 for watertight bulkheads.

3.6.2.9 Structural requirements for hull members of opening vessels:

.1 Opening vessels consist of two separate semi-hulls with asymmetrical lines, connected by hinges positioned above the deck at the ends of the hopper. When discharging the spoil, the semi-hulls are opened about a common longitudinal axis on the centre line of the ship by means of hydraulic devices.

The structure of each semi-hull is to comply with the requirements of Section 2 with due regard for 3.6.2; transverse or longitudinal or both framing systems may be adopted. In hopper side buoyancy tanks transverse ring structures spaced as required by 3.6.2.11.1 are to be fitted.

.2 Where hinges are installed in opening hopper dredgers and hopper barges, deck plating and framing are to be strengthened. Hinge eyes are to pierce the decks.

.3 Stops are to be fitted in the opening vessels between semi-hulls forward and aft from the hopper space. The stops are to be arranged at the levels of the bottom and the deck and are to prevent the hulls from displacement relative to one another.

.4 Scantlings of brackets connecting framing members of each semi-hull are to comply with the requirements of 3.6.2.11.3.
5 Longitudinal bulkheads and coamings of the hopper are to be extended with brackets as required by 3.6.2.7.4 and 3.6.2.11.7.

3.6.2.10 Fixing of dredging gear:

1 Hull framing is to be strengthened in way of the main and ladder gallow.

The stanchions of the ladder gallow may terminate at the deck. In such case, pillars, vertical webs or other equivalent structures are to be provided under the stanchions or longitudinal and transverse bulkheads are to be fitted.

The stanchions of the main gallow are to extend to the bottom and be efficiently connected with longitudinal and transverse framing, otherwise transverse bulkheads are to be fitted under the stanchions.

2 In way of grab crane, spuds and other dredging gear adequate strengthening is to be provided.

3.6.2.11 Specific structures:

1 Whatever the hull framing of single-hull hopper dredgers and barges in way of the hopper is adopted, transverse ring structures consisting of the following items are to be fitted:

- solid platforms or ring structures in the side buoyancy spaces and centre line box keel;
- a lower cross member in the bottom part of the hopper, connecting the centre line box keel with longitudinal bulkheads of the hopper;
- an upper cross member inside the hopper at a level of the main deck and upper edge of the coaming where its height more than 0.2 m (where the requirements of 3.6.4.11.10 are complied with, upper cross members need not be fitted);
- vertical webs on the hopper coaming.

The maximum distance between transverse ring structures is not to be less than $b = (0.012L + 2.9)$ m.

2 The construction of diaphragms is to comply with the requirements of 2.5.2.2. Diaphragms which are more than 1 m in width are to be strengthened by vertical and horizontal stiffeners. Where longitudinal framing is adopted, horizontal stiffeners are to be fitted in line with side and bulkhead longitudinals. In lieu of the diaphragms watertight (non-tight) bulkheads complying with the requirements of 2.7.2 may be used.

3 The transverse ring structure in the side buoyancy space, fitted in lieu of the diaphragm, is to consist of side shell, bulkhead, bottom and deck transverses. The longitudinal bulkhead and side shell transverses are to be connected by means of cross ties which are to be so positioned that the distance between them, between a cross tie and a bottom or deck transverse is not more than 3 m. In lieu of the cross ties, use may be made of braces connecting a bulkhead transverse with a bilge or deck transverse bracket. Where platforms are fitted in side buoyancy spaces at the same distance as cross ties, cross ties and braces may be omitted.

The brackets connecting transverse ring structure items in the side buoyancy space are to have the length of the arms not less than one-twelfth of the greater span of the connected members. The free edge of the bracket is to have a face plate of the same width as that of the face plate of the greater member connected. The bracket thickness is to be equal to the web thickness of the greater member connected.

4 Hopper lower cross members may consist of a web with openings and face plates provided on the upper and lower edges or may take the form of a hollow box, generally of triangular cross-section.

The web thickness of the hopper lower cross member is to be taken equal to the plating thickness of the hopper longitudinal bulkheads at the corresponding level.

A cross member web is to be strengthened with stiffeners spaced 900 mm apart.

The upper face plate of the hopper lower cross member is to be made of a tube, section, round or flat bar, the lower face plate is to be fabricated of a flat bar having a thickness not less than that of the bottom plating.

The hopper lower cross members are to be connected with the hopper longitudinal bulkhead and centre line box keel by brackets having length of the arms equal to one-tenth of the length of the cross member upper face plate. The thickness of brackets is to be taken equal to the thickness of the cross member web. Where the depth of the cross member and centre line box keel is the same, brackets on the centre keel need not be fitted. The structure of box-type cross members is similar to that of the centre box keel. Where cross members are of a box shape, their lower and upper face plates are to be welded to the plating of the buoyancy spaces and centre line box keel.

5 The centre line box keel fitted in the hopper is generally fabricated as a closed box structure. The plating thickness of the sides is to be equal to that of hopper longitudinal bulkheads at the corresponding level, but not less than 8 mm for vessels of 60 m in length and less than 10 mm for vessels of more than 60 m in length. The thickness of the centre line keel bottom strake is to be not less than that of the plate keel. Where the transverse framing is adopted, the stiffeners in the upper part of the centre line box keel are to be connected with brackets, the thickness of which is to be not less than that of the floor and height not less than 2.5 times the depth of the stiffener web.

Where the breadth of the centre line box keel at bottom exceeds 1 m, but not more than 2 m, a bottom longitudinal is to be fitted on centre line box keel bottom, the depth of which is to be equal to half the floor depth. Where the breadth of the centre line keel is more than 2 m, an intercostal side girder
having the same scantlings as the floor is to be fitted in lieu of the above longitudinal. The scantlings of floors are assumed the same as those of floors fitted in correspondingly framed buoyancy spaces.

On the top, the centre line box keel is to terminate in a bar, or an angle, or a cover plate, the thickness of which is to be equal to that of the centre line box keel.

The centre line box keel sides are to extend beyond the hopper transverse bulkheads by brackets, the arm lengths of which are to be equal to the depth of the centre line box keel, and the thickness equal to that of the centre line box keel side.

6. The upper cross members of the hopper space may consist of a web with openings and face plates on the upper and lower edges or be fabricated in the form of a hollow box generally of a triangular or another cross-section.

It is recommended that the upper cross members be attached to the hopper longitudinal bulkhead by brackets the arm lengths of which are to be equal to the depth of the upper cross member, and the thickness to its web thickness.

The upper cross members are to be connected to the centre line box keel by pillars, where such a keel is fitted.

7. The hopper coaming may be transversely or longitudinally framed. The upper edge of the coaming is to be stiffened with a face plate having a width not less than one-tenth of the coaming height and a thickness not less than a coaming thickness.

In case of longitudinal framing, the coaming is to be strengthened by longitudinals spaced not more than 900 mm apart.

In case of transverse framing, vertical stiffeners are to be fitted between stays at every frame.

The hopper side coamings are to be extended beyond the hopper ends by the brackets for a distance equal to 1.5 times the coaming height. Deck girders extending not less than three frame spaces from a bracket end are to be fitted under the brackets.

8. In floating cranes, the tub plating is not to be cut at the upper deck. No horizontal welds are permitted in the tub plating within the area extending for 0.2h up and down from the upper deck (where h is the distance between the bottom and the upper deck in way of the tub position).

9. Diaphragms are to be fitted inside the crane tub in line with the upper deck and platform.

10. For outer plating of specific structures 20 mm and more in thickness in way of the hopper steel of not lower than grade D is to be utilized. Use of plates having a thickness 50 mm and more is subject to special consideration by the Register.

3.6.3 Design loads.

3.6.3.1 Design loads on the main hull structures are to be determined in compliance with Sections 1 and 2 at draughts $d_1$ and $d_2$ and the wave coefficient $c_w$ under dredging conditions and during voyage. For dredging conditions, the wave coefficient $c_w$ is not to be taken greater than $2(D + h - d_1)$.

3.6.3.2 The maximum value of the design load for vessel’s extremities during voyages is to be obtained as required by 2.8.3 using the draught at the section 0.1L from the forward perpendicular. For the transom bulkhead angles $\alpha = 0$ and $\beta = 90^\circ$ are assumed.

3.6.3.3 The design bending moments and shear forces in vessels of dredging fleet having $L \geq 60$ m are to be determined for voyage and for dredging conditions.

For voyage the hopper space is considered to be filled with water up to the effective waterline (or empty if such case is possible), stores and outfit are taken as 100%, all gear being stowed for sea.

For the case of dredging operations, the hopper space is considered to be filled with homogeneous soil up to the upper overflow level (coaming), there are no stores on board, the draught is equal to $d_1$, gear being stowed for sea.

Wave bending moments and shear forces are to be determined as required by 1.4.4.

3.6.3.4 Opening vessels:

1. In opening vessels, still water and wave bending moment is created both by vertical and horizontal forces. Bending moments are calculated first in $yGy$ coordinate system and then re-calculated for the basic inertia axes $x$ and $y$ of each semi-hull (Fig. 3.6.3.4.1). A fully loaded hopper space at the maximum draught of the vessel is taken as a design case. Bending of each semi-hull hopper is considered separately. Deck hinges and hydraulic cylinders are assumed to be supports located at the hopper ends.

---

**Fig. 3.6.3.4.1:**
1 - hinges; 2 - hopper space
Besides, the following cases are considered: sailing in the work area with soil in the hopper, dredging gear stowed for sea; voyage with water in the hopper space or in the ballast condition (the hopper is empty, wherever practicable). Stores and outfit are taken in full, all gear stowed for sea.

.2 The type of supporting structures and the clearance between two semi-hulls in the fore and aft ends of the hopper space determine the conditions of horizontal moments calculation.

Where supporting structures fitted at the deck or bottom level forward or aft of the hopper space provide the absence of any clearance between the semi-hulls, and the length of the supporting structures creates adequate fixing against the horizontal forces acting athwart the hopper space, the horizontal force calculation is made assuming that a semi-hull is rigidly restrained at each hopper end.

Otherwise a semi-hull is considered to be freely supported.

.3 Vertical loads.

The vertical bending moment at any section \( M_v \), in kN·m, acting on each semi-hull is to be determined by the formula

\[
M_v = 0.5(M_{wx} + M_{wx})
\]  
(3.6.3.4.3)

where \( M_{wx} \) = still water bending moment to be obtained by load integration of the vessel with connected hulls for loading conditions referred to in 3.6.3.4.1, in kN·m;

\( M_{wx} \) = wave bending moment for the vessel with connected hulls, to be determined as required by 1.4.4., in kN·m.

Vertical moments are considered positive in case of hogging and negative in case of sagging.

.4 Horizontal loads.

The horizontal bending moment \( M_{wh} \), in kN·m, acting on each semi-hull at the sections taken in the middle and at ends of the hopper space is to be determined by the formula

\[
M_{wh} = M_{wsu} + M_{wu}
\]  
(3.6.3.4.4-1)

where \( M_{wsu} \) and \( M_{wu} \) = horizontal still water and wave bending moments at the section under consideration, respectively, in kN·m.

Horizontal moments are considered positive where the outer side of one semi-hull is subjected to tensile stresses.

The horizontal moment acting on a semi-hull depends on the fixing used at the ends of the hopper space.

Where a semi-hull is considered rigidly fixed at the ends of the hopper space, the horizontal moment is to be determined using the following formulae:

\[
M_{wh} = 0.10p_0^2 B; \quad (3.6.3.4.4-2)
\]

at the hopper end sections

\[
M'_{wh} = -0.10p_0^2 B \quad (3.6.3.4.4-3)
\]

where \( p = 0.5(p - p' - \rho_d) \) kN/m

in waves

at the section taken in the middle of the hopper space

\[
M_{wh} = M_{wx} \frac{d_1}{B} (\psi_1 + \psi_2 \frac{E}{d_1}) \quad (3.6.3.4.4-4)
\]

at the hopper end sections

\[
M'_{wh} = M_{wx} \frac{d_1}{B} (1 + \psi_3 \frac{E}{d_1}) \quad (3.6.3.4.4-5)
\]

where \( \psi_1 = 0.611B/L = 0.103; \)

\( \psi_2 = 0.50B/L = 0.100; \)

\( \psi_3 = 0.85B/L = 0.112; \)

\( \psi_4 = 0.37B/L = 0.050; \)

\( E = \alpha(C_b + 0.7138 - 0.128\frac{300 - L}{100} \sqrt{\gamma}); \)

\( \alpha = 1.35L/100 = 0.215. \)

Where the semi-hull is not fixed at the hopper ends, the horizontal moment at the section at the middle of the hopper space is to be determined by the following formulae:

\[ M_{wh} = 0.15p_0^2 B, \quad (3.6.3.4.4-6) \]

in still water

\[
M_{wh} = M_{wx} \frac{d_1}{B} (1 + \psi_5 \frac{E}{d_1}) \quad (3.6.3.4.4-7)
\]

where \( \psi_5 = 1.23(B/L - 0.5). \)

The still water and wave horizontal bending moments at the hopper end sections are equal to zero.

The sign of \( M_{wx} \) is to be taken into account in determination of \( M_{wh} \) and \( M'_{wh} \).

It is assumed that \( M_{wh} \) and \( M'_{wh} \) are equal to zero during voyage whatever the fixing conditions are.

.3.6.3.5 Bending moments acting on the hull of the floating crane are to be determined for operating conditions in the work area and a voyage.

For the operation in the work area the design vertical bending moment \( M_{sp} \), in kN m, is to be determined by the formula

\[
M_{sp} = M_{sw} + M_g + M_w \quad (3.6.3.5)
\]

where \( M_{sw} \) = still water bending moment according to 1.4.3, in kN·m;

\( M_g \) = bending moment due to the weight of the load suspended on the crane hook, in kN·m;

For a voyage \( M_g \) is assumed to be equal to zero.

\( M_w \) = wave bending moment for work areas and a voyage to be determined using a procedure approved by the Register for a specified length and height of the wave.

.3.6.3.6 The design pressure \( p_o \), in kPa, on the bulkheads bounding the hopper space, on the
structures of the enclosed watertight centre line box keel is to be determined using the formula

\[ p_1 = \rho g z_i \]  

(3.6.3.6)

where \( z_i \) = distance of the load application point from the upper weir level (upper edge of the coaming), in m.

3.6.3.7 The design load \( p_1 \), in kPa, on a partial bulkhead (diaphragm) or a transverse ring structure of the side buoyancy space at a level of the mid-height of the hopper lower cross member due to soil pressure, having regard to the outer counterpressure, is to be determined by the formula

\[ p_1 = g(0.8\rho, H_1 - 1.5\rho, h_c - 0.1\rho, H_e) \]  

(3.6.3.7)

where \( \varepsilon = \begin{cases} 0 & \text{for } D \leq 4 \text{ m; } \\
0.2D - 0.8 & \text{when } d_1/D \leq 0.75 \\
0.4D - 1.6 & \text{when } d_1/D > 0.75 
\end{cases} \) for \( D > 4 \text{ m.} \)

3.6.3.8 The vertical design load \( p_2 \), in kPa, due to soil pressure, having regard to the counterpressure of the water on the lower cross member of the hopper space is to be determined using the formula

\[ p_2 = g\rho, H_2 - (\rho, d_1 + 0.5\rho, c) - \rho, A(b, h, k, A, b, k, l, (l, c, b), l, c, b, l)) \]  

(3.6.3.8)

3.6.3.9 The horizontal design load \( p_3 \), in kPa, due to the dredged spoil pressure on face plates of the hopper lower cross member is to be obtained from the formulae:

for the upper face plate

\[ p_3' = \frac{1}{6} g \rho, h, l, c \]  

(3.6.3.9)

for the lower face plate

\[ p_3'' = \frac{1}{3} g \rho, h, l, c \]  

(3.6.3.9)

3.6.3.10 The design load \( p_4 \), in kPa, on the framing members and on the plating of the hopper coaming is to be determined using the formula

\[ p_4 = g \rho, h_c \]  

(3.6.3.10)

The value \( p_4 \) is to be taken not less than 15 kPa.

3.6.3.11 The design axial force \( N \), in kN, acting at the mid-height level of the hopper lower cross member on a diaphragm or a transverse ring structure of the side buoyancy space is to be determined by the formula

\[ N = gh, H_1 [0.45\rho, H_1 + 0.63\rho, h_c - 0.03\rho, H_e] \]  

(3.6.3.11)

where \( m = 0 \) for \( D \leq 3.5 \text{ m; } \)

\( m = 1 \) for \( D > 3.5 \text{ m, } d_1/D \leq 0.75; \)

\( m = (9D - 31.5)(d_1/D - 0.75) \) for \( D > 3.5 \text{ m, } d_1/D > 0.75; \)

3.6.3.12 The design axial force \( R_{lcr} \), in kN, acting on the lower cross member of the hopper space is to be obtained from the formula

\[ R_{lcr} = 0.163 \frac{b}{g, H_1} \left[ \rho, H_1^2 (3D - H_2) - \rho, (d_1 - 0.5c_u)^2 (3D - d_1 + 0.5c_u) \right] \]  

(3.6.3.12)

3.6.3.13 The design axial force \( R_{up,cr} \), in kN, acting on the upper cross members of the hopper space is to be determined using the following formulae:

1. for the upper cross member fitted at the deck level

\[ R_{up,cr} = R_1 - R_2 - R_3 - R_4 \]  

(3.6.3.13.1)

where \( R_1 \) = pressure of dredged soil on the upper cross member obtained as:

\[ R_1 = \frac{g \rho, d_1}{2H_1} \left( 2H_2 - 3h, c \right); \]

\( R_2 \) = external hydrostatic pressure on the upper cross member to be obtained as

\[ R_2 = \frac{g \rho, b_1 - 0.5c \rho, A, b, k, l, c, b, l)}{2H_1} \left( 2d_1 - c_u - 3h, c \right); \]

\( R_3 \) = reaction due to supporting bending moment at the junction of the diaphragm with the lower cross member to be determined as:

\[ R_3 = \frac{pb_1^{l, c, b, l}}{2H_1}; \]

\( R_4 \) = force resulting from supporting reactions of the hopper lower cross member determined from the formula

\[ R_4 = \frac{b_1^{l, c, b, l}}{2H_1} (p_2 + 2\rho, 0.5A, b, k, l, c, b, l); \]

2. for the upper cross member fitted at the upper face plate of the hopper coaming

\[ R_{up,cr} = g \rho, h, l, c \]  

(3.6.3.13.2)

3.6.3.14 The design load on deck is to be not less than 20 kPa.

3.6.3.15 The design loads on the structures of each semi-hull of opening vessels are to be determined in compliance with 3.6.3.1 to 3.6.3.14.

3.6.3.16 In opening hopper dredgers and hopper barges, for each hydraulic press, the horizontal statical force \( F_{H} \), in kN, necessary to keep the hull closed is determined by the formula (see also Fig. 3.6.3.16).

\[ F_{H} = \frac{1}{n, i} \left[ -F_{\mu}, a, + F_{\mu}, \alpha, \beta, \gamma, (\Delta, a, - \Delta, b, \beta, - g, Q, b, \gamma) \right] \]  

(3.6.3.16-1)

where \( n, i \) = number of hydraulic presses; 

\( F_{\mu} \) = horizontal force of water pressure on the hull, determined by the formula

\[ F_{\mu} = 0.5g \rho, d_1 (d_1 - 0.5c); \]

\( F_{a} \) = horizontal force of dredged soil pressure on the hull, determined by the formula

\[ F_{a} = 0.5g \rho, d_1 (d_1 - 0.5c); \]

for \( c \), see Fig. 3.6.3.4; 

\( a_1, a_2, a_3, b_1, b_2, b_3 \) = force arms, in m (see Fig. 3.6.3.16).
For design force $F_{des}$, the maximum pressure value achieved by the hydraulic press is adopted, with $F_{des} \geq F_H$.

The horizontal static force in each hinge $F_{h}$, in kN, is determined by the formula

$$F_h = \frac{1}{2}[F_h + n_1F_H - n_1\frac{a_h}{a_h}(F_{des} - F_H)] \quad (3.6.3.16-2)$$

where $a_h$ = arm of the force acting upon the stop, in m.

The horizontal static force acting upon each stop is determined by the formula

$$F_{st} = \frac{n_1a_h}{2a_h} (F_{h} - F_H) \quad (3.6.3.16-3)$$

where $n_1$ = number of stops.

The vertical components of static forces in hinges are assumed equal to zero.

3.6.3.17 The dynamic forces acting on hydraulic cylinders and deck hinges are to be determined by calculations of vessel’s motions in a seaway, with various course angles, in light-ship and full-load conditions. Based on these calculations, maximum vertical and horizontal forces acting on the hydraulic presses are determined. The calculation is to be made using a procedure approved by the Register.

3.6.4 Scantlings of structural members.

3.6.4.1 Scantlings of structural members are to be determined in compliance with Sections 1 and 2, having regard to the provisions of this Chapter.

3.6.4.2 The required hull section modulus of a single-hull vessel of 60 m in length and over is to be determined as required by 1.4.6 for deck, bottom, upper edge of the hopper coaming, having regard to specified work areas and voyages. The greater value obtained for the work area or voyage (see 3.6.3.3 and 3.6.3.4) is to be taken.

For opening hopper dredgers and hopper barges the required section modulus is to be determined for the case when both semi-hulls are connected (see 3.6.3.4).

3.6.4.3 When calculating the actual section modulus of the hull in view of the hopper space as required by 1.4.8, account is to be taken of all continuous longitudinals, longitudinal bulkheads and the hopper space coamings with longitudinals, 85 per cent of the total area of centre line box keel longitudinal members, provided they are properly interconnected with the longitudinal framing members beyond the hopper and fitting of transverse members regulated by the Rules, inside the hopper.

The continuous deck plating longitudinally framed above the hopper space and a wash bulkhead in the hopper may be included in the actual section modulus calculation using a procedure approved by the Register.

3.6.4.4 Longitudinal strength of each semi-hull of opening hopper dredgers and hopper barges is to be checked for vertical and longitudinal bending moments in asymmetrical bending (see Fig. 3.6.3.4.1).

1. Normal stresses arising in cross-section points under conditions of asymmetrical bending are to be determined amidships and at the end bulkhead sections of the hopper space (from inside the hopper), provided the hulls at this position are rigidly restrained.

Stresses $\sigma$, in MPa, are to be determined by the formula

$$\sigma = \left( \frac{M_y \cdot y}{T_x \cdot T_y} \right) \cdot 10^{-3} \quad (3.6.4.4.1-1)$$

where $M_x = M_x \cdot \cos \alpha - M_y \cdot \sin \alpha$;

$M_y = M_y \cdot \sin \alpha + M_x \cdot \cos \alpha$;

for $M_x$ and $M_y$, see 3.6.3.4.3 and 3.6.3.4.4;

$\alpha$ = rotation angle of main inertia axes (positive value of $\alpha$ — rotation Gx axis counter-clockwise), it is to be determined using the formula

$$\alpha = 2\cot^{-1}(L_o - L_i) \quad (3.6.4.4.1-2)$$

$I_x = \Sigma u_i \cdot v_i \cdot dS_i$ — centrifugal inertia moment about axes Gx, Gy with no regard for wear allowance, in m$^4$;

$u_i, v_i$ = distance of the centre of gravity of $i$-th member area from the axes Gx, Gy, in m;

$dS_i = i$-th member area, in m$^2$;

$I_x, I_y$ = inertia moments of the semi-hull cross-section about axes Gx, Gy with no regard for wear allowance, in m$^4$;

$x, y$ = coordinates of the section point under consideration about main axes Gx, Gy (see Fig. 3.6.3.4.1), in m;

$I_{xx}, I_{yy}$ = inertia moments of the semi-hull cross-section about the main axes with no regard for wear allowance, in m$^4$.

2. Normal stresses acting in the semi-hull cross-section (for normal strength structural steel) are not to exceed:

- 150 MPa for the lower edge of the deck stringer;
- 145 MPa for the upper edge of the plate keel;
- 165 MPa in the face plate of the hopper coaming.

3. Permissible shear stresses for members made of normal strength structural steel and participating in the longitudinal bending are assumed equal to 115 MPa. Equivalent stresses $\sigma_{eq} = \sqrt{\sigma^2 + 3\tau^2}$ at the
sections where substantial normal stresses and shear stresses (at the hopper ends) act are to be not more than 170 MPa.

4 Buckling strength of compressed members according to 1.6.5 is to be ensured.

3.6.4.5 Bottom framing:

1 When the bottom is transversely framed, the moment of inertia and scantlings of floors in side buoyancy spaces are to be determined as required by 2.3.4.1.1; in this case, to be taken as \( B_1 \) is doubled breadth of the buoyancy space over the bottom.

2 Where a single bottom is longitudinally framed, the section modulus of bottom longitudinals in buoyancy spaces is to be not less than that determined in compliance with 2.3.4.2.1. The floors are to be fitted in line with transverse ring structures, their section modulus and cross sectional area to be not less than determined from 2.3.4.2.3 and 2.3.4.2.4. The section modulus and depth of a side girder are to be not less than that required for the floor.

The floor web depth is not to be less than 0.13\( B_1 \) (see 3.6.4.5.1).

3 The scantlings of the bottom framing members in each semi-hull of required opening vessels are to be determined as required by 2.3.4.2; to be taken as breadth \( B_1 \) is the breadth of one semi-hull at the section under consideration. There is no bottom centre girder in opening vessels.

4 The scantlings of double bottom members in way of the hopper space are determined as for dry cargo ships having double skin construction according to 2.4 with regard to 3.6.2.4; beyond the hopper as for dry cargo ships with single skin construction in compliance with the requirements of the same paragraphs.

The plate floor spacing is not to exceed the maximum spacing of transverse ring structures, specified in 3.6.2.11.1.

5 For floating cranes the section modulus of bottom transverses is to be as required by 2.3, and additional bottom longitudinals are to have the same section modulus as for main longitudinals.

6 In calculating the section modulus and the depth of floors in accordance with 2.3, \( B_1 \) is assumed to be the floor span between the side shell and the longitudinal bulkhead or between the longitudinal bulkheads, but not less than 0.4 of the full breadth of the ship.

7 In case of longitudinally framed bottom, the scantlings of floors and bottom longitudinals of floating cranes beyond the double bottom area are to be determined in accordance with 2.3.4.2.

3.6.4.6 Shell plating:

1 Shell plate scantlings are determined in accordance with 2.2.4.

The thickness of the bottom strakes to which hopper longitudinal bulkheads or well sides are connected is to be increased by 15 per cent as against that of the bottom plating. Where there is no centre line box keel, the thickness of the bottom strakes abutting on the hopper longitudinal bulkhead is to be increased by 50 per cent.

2 The side shell plating thickness at the hopper ends is not to be less than required by 1.4.7.

3 In vessels with pontoon hulls, the thickness of the bottom and side shell plating within 0.15\( L \) from the forward and after perpendiculars is not to be less than the plating thickness within the midship region.

4 The thickness of the well side plating is to be equal to the thickness of the side shell plating in area concerned, but not less than 8 mm.

5 In opening vessels the shell plating thickness is to be determined with regard for 3.6.4.4.

The thickness of the bottom strakes at the hopper longitudinal bulkhead need not be increased.

6 In floating cranes the thickness of the bottom plating within 0.2\( L \) from the forward perpendicular is to be increased over the entire breadth of the hull by 30 per cent as against the minimum thickness required by 2.2.4.8.

In the fore peak and the areas extending forward for 0.1\( L \) from the stern transom corners and inboard for 0.1\( B \), the thickness of the side shell plating is to be increased over the entire depth by 30 per cent as compared to the minimum thickness required by 2.2.4.8 (see also 3.6.2.5.2).

In other regions along the hull length, the minimum thickness of the shell plating is to be increased by 10 per cent as against that prescribed by 2.2.4.8.

7 The plating thickness of the bow and stern transoms in floating cranes is not to be less than required by 3.6.4.6.3.

3.6.4.7 Side framing.

The scantlings of the side framing members are to be determined in compliance with 2.5, having regard to 3.6.2.4, 3.6.2.11 and the requirements below:

1 The section modulus of frames in transversely framed side buoyancy spaces is to be determined from 2.5.4.1 as for dry cargo ships.

Where a side stringer is fitted at a level of fenders, main frame span may be determined in compliance with 2.5.1.2 as for side transverses of tankers, provided the structure of the side stringer meets the requirements of 3.6.4.7.2. Where no transverse ring structures are fitted, braces may be provided in line with horizontal girders of longitudinal bulkheads.

2 The scantlings of side stringers are to be determined as required by 2.5.4.4 as for the case of fitting web frames. The width of the side stringer is not to be less than 0.08\( (l^6 = \text{stringer span as measured between web frames or between those and tight transverse bulkheads}) \) or 2.5 times the frame depth, whichever is the greater. Side stringers are to be
aligned with cross ties of the transverse ring structures.

3. The section modulus of side longitudinals is to be determined as required by 2.5.4.3 with $k_n$ values taken as for dry cargo ships.

4. The section modulus and cross-sectional area of web frames which are a part of a transverse ring structure are to be not less than those required in 2.5.4.5 for side transverses of tankers.

A web frame span is to be measured between the inner edges of the floor and an inner edge of the beam.

The depth of the web frame is not to be less than $0.1l$ or 2.5 times the width of longitudinals (whichever is the greater) and may be assumed varying with reduction at the upper end and increase at the lower end by 10 per cent as against the average value.

5. The section modulus of well longitudinal bulkhead stiffeners is not to be less than required for side frames.

6. In floating cranes, the section modulus of main and intermediate frames in the fore peak is to be increased by 20 per cent as compared to that required by 2.8.4.2.2.

7. The section modulus of web frames in floating cranes $W$, in cm$^4$, within the region specified in 3.6.2.5.3 is not to be less than:

$$W = 0.95 \left( 300 + \frac{120}{\sigma_n} b p l^2 \right) \omega_e$$  \hspace{1cm} (3.6.4.7.7)

where $l$ = web frame span measured between the deck and the upper edge of the floor, in m;

$p$ = as defined in 3.6.3, but not less than 0.5$p_{gl}$, in kPa.

8. The scantlings of the framing members of the bow and stern transoms are not to be less than required by 3.6.4.7.2 to 3.6.4.7.4 and 3.6.4.7.6.

3.6.4.8 Decks:

1. The plating thickness of the strength deck within the midship region is to be taken not less than the sheerstrake thickness.

The minimum thickness of the deck plating in vessels of dredging fleet is to be determined according to 2.6.4.2 as for the strength deck. For floating cranes the minimum thickness of the upper deck is to be increased by 10 per cent as against that prescribed by 2.6.4.2 as for the strength deck.

2. Compressive stresses in deck are to be determined under the action of bending moment components according to 3.6.3. The buckling strength requirements of 1.6.5 are to be met.

3. The depth of deck transverses in buoyancy spaces which form a part of the transverse ring structure is to be equal to two-thirds of the floor depth, while the thickness of the web plate and sizes of the face plate are to be equal to those of the vertical webs. The depth of the deck transverse is to be not less than 2.5 times the height of the deck longitudinal.

4. For floating cranes the section modulus of deck girders is to be determined as required by 1.6.4.1 with $k_n = 0.6$ and $m = 12$.

5. The deck plating thickness under the seats of special arrangements fitted on the deck (cat cranes of suction tubes, transfer appliances, grab cranes, etc.) and where special metal structures pass through the deck (main and ladder gallow) is to be increased by 25 per cent.

3.6.4.9 The scantlings of side and deck framing members, the thicknesses of deck plating, bulkhead framing and plating, and coamings of opening vessels are to be determined with regard for 3.6.4.4.

Where vertical webs and web frames are connected by cross ties or braces, the scantlings of vertical webs, web frames and braces are to be submitted to the Register for consideration.

3.6.4.10 In vessels with pontoon hulls, the scantlings of side stringers at the forward end of the vessel are to be prescribed as required by 2.8.4.5, the height and thickness of vertical webs and web frames are to be the same as the width and thickness of the stringer.

3.6.4.11 Specific structures of vessels of dredging fleet:

1. The section modulus $W$, in cm$^4$, of the diaphragm of the buoyancy space after deduction of openings, or the total section modulus of a vertical web and a web frame of the transverse ring structure at the section of a mid-point of the hopper lower cross member depth is not to be less than:

$$W = \frac{10^3 b H_i^2}{m k_n \sigma_n} \omega_e$$  \hspace{1cm} (3.6.4.11.1)

where for $H_i$, see Fig. 3.6.1.6;

$m = 12$;

$k_n = 0.6$;

$p_l$ = as defined in 3.6.3.7.

2. The cross-sectional area $f_i$, in cm$^2$, of the diaphragm, or the total sectional area of a vertical web and a web frame of the transverse ring structure at a level of a mid-point of the hopper lower cross member depth is to be not less than

$$f_i = \frac{10 N}{k_n \tau_n} + 0.1 \Delta f_i$$  \hspace{1cm} (3.6.4.11.2)

where $N$ = as defined in 3.6.3.11;

$k_n = 0.65$;

$\Delta f_i = \Delta b h_i$;

$h_i$ = typical member scantlings (half-breadth of deck, web height of longitudinal, etc.), in cm.

The scantlings of the transverse ring structure members (bottom transverse, vertical web, side and deck transverses) are to be not less than required by the relevant paragraphs of this Chapter for such members.

3. The section modulus $W$, in cm$^4$, sectional area of the hopper lower cross member web $f_n$, in cm$^2$,
after deducting openings, sectional area of the floor with face plates \( f_0 \), in \( \text{cm}^2 \), are not to be less than:

\[
W = \frac{10^3 h_{cr}^2}{m k_s \sigma_n} \ p_2 \delta;
\]  
(3.6.4.11.3-1)

\[
f_w = 5 \frac{h_{cr}}{k_s \sigma_n} (p_2 + 0.5 \rho \frac{g}{k_{cr}} \ A_{b,k}) + 0.1 \Delta f_i;
\]  
(3.6.4.11.3-2)

\[
f_0 = \frac{10R_{cr}}{k_s \sigma_n} + 0.1 \Delta f_i;
\]  
(3.6.4.11.3-3)

where \( m = 12; \)

\( k_s = 0.45; \)

\( k_r = 0.2; \)

\( p_2 = \) as defined in 3.6.3.8;

\( R_{cr} = \) as defined in 3.6.3.12;

for \( f_i \), see 3.6.4.11.2.

.4 The section modulus of the face plates of the hopper lower cross members \( W \), in \( \text{cm}^3 \), about the horizontal axis and sectional area \( f_{fp} \), in \( \text{cm}^2 \), are not to be less than:

for the upper face plate

\[
W = \frac{10^3 l_{cr}^3}{m k_s \sigma_n} \left[ 3 - \frac{(l_1 - l_2)^2}{l_1^2} \right] p_3 \delta \ \omega_c;
\]  
(3.6.4.11.4-1)

\[
f_{fp} = \frac{2.5 l_{cr} (l_1 + l_2)}{k_s \tau_n} p_3 \delta + 0.1 \Delta f_i;
\]  
(3.6.4.11.4-2)

for the lower face plate

\[
W = \frac{10^3 l_{cr}^3}{m k_s \sigma_n} 2 p_3 \delta \ \omega_c;
\]  
(3.6.4.11.4-3)

\[
f_{fp} = \frac{5 h_{cr} l_{cr}^2}{k_s \tau_n} p_3 \delta + 0.1 \Delta f_i;
\]  
(3.6.4.11.4-4)

where for \( l_1 \) and \( l_2 \), see Fig. 3.6.1.6;

\( m = 24; \)

\( m_1 = 12; \)

\( k_s = 0.6; \)

\( k_r = 0.45; \)

\( p_3 \), \( p_4 \) as defined in 3.6.3.9;

\( \Delta f_i \) as defined in 3.6.4.11.2.

.5 The section modulus of bulkhead vertical webs, horizontal girders, vertical stiffeners and longitudinal of the hopper longitudinal bulkheads are to be determined as for side framing according to 3.6.4.7 with substitution of \( p \) according to 2.5.5 by \( p_{1p} \) according to 3.6.3.6. For the longitudinal bulkhead stiffeners \( m = 11 \) and \( k_s = 0.75. \)

The depth of the vertical web is to be not less than \( 0.12l \) and may be assumed varying with reduction at the upper end and increase at the lower end by 10 per cent as compared to the average value.

Two upper longitudinals are to be taken the same as the third longitudinal from the deck.

Besides, three upper and three lower longitudinals are to be checked according to 1.6.5.4.

The width of the horizontal girder is to be equal to that of the bulkhead vertical web.

.6 The plating thickness of the hopper longitudinal and end bulkheads is to be determined as required by 1.6.4.4 assuming \( p = p_s \) (where \( p_s \) is to be obtained from 3.6.3.6), \( k_s = 0.7, m = 15.8. \)

The upper strake thickness of the hopper longitudinal bulkhead at 0.1D below the deck is not to be less than the sheerstrake thickness. The lower strake thickness of the longitudinal bulkhead at 0.1D from the base line is not to be less than the bottom plating thickness.

.7 The minimum thickness of hopper bulkhead plating is to be equal to:

- 8 mm for vessels having the length \( L < 60 \text{ m} \) and
- 10 mm for vessels having the length \( L \geq 80 \text{ m}. \)

For intermediate values of \( L \), the minimum thickness is to be determined by linear interpolation.

.8 The section modulus \( W \), in \( \text{cm}^3 \), of vertical stiffeners and stanchions of the hopper coaming is not to be less than determined by the formula

\[
W = \frac{10^3 h_{cr}^2}{m k_s \sigma_n} \omega_c;
\]  
(3.6.4.11.8-1)

where \( p_s \) = as defined in 3.6.3.10;

\( m = 15 \) for stanchions where upper cross members are fitted in line with transverse ring structures at the coaming top;

\( m = 6 \) for stanchions where no upper cross members are fitted at the coaming top;

\( m = 15.6 \) for vertical stiffeners where transverse framing is adopted;

\( k_s = 0.6. \)

The section modulus \( W \), in \( \text{cm}^3 \), of horizontal stiffeners and face plate of the coaming is not to be less than:

\[
W = \frac{10^3 a h_{cr}^2}{m k_s \sigma_n} \omega_c;
\]  
(3.6.4.11.8-2)

where \( z_i \) = distance between the coaming top and horizontal stiffeners, but not less than half the coaming height, in \( m; \)

\( m = 12; \)

\( k_s = 0.2. \)

The sectional area \( f_s \) of the coaming stanchion, in \( \text{cm}^2 \), at deck is not to be less than:

\[
f_s = \frac{4 a h_{cr} p_s}{k_s \tau_n} + 0.1 \Delta f_i;
\]  
(3.6.4.11.8-3)

where \( k_s = 0.45; \)

\( \Delta f_i \) as defined in 3.6.4.11.2.

The plate thickness of the side (end) coaming is to be determined as for the longitudinal (end) bulkhead of the hopper \( p_s \) according to 3.6.3.6 as measured at the deck level, but it is to be taken not less than the upper strake thickness of the longitudinal bulkhead.

The depth of the stanchion at deck is to be not less than 0.12\( h_{cr} \) and the thickness not less than the coaming thickness.

\footnote{For stanchions \( b \) is substituted for \( u. \)}
The plate thickness of the coaming and moment of inertia of the horizontal stiffeners and face plate of the coaming are to meet the buckling strength requirements according to 1.6.5.

9 The sectional area of the upper cross members spanning hopper space at deck level and/or coaming level \( f_{up,cr} \), in \( \text{cm}^2 \), is not to be less than:

\[
f_{up,cr} = 0.085 R_0 + 0.1 \Delta f_i \quad (3.6.4.11.9-1)
\]

where \( \Delta f_i \) as defined in 3.6.4.11.2.

Where a load from bottom closing appliances is applied to the upper cross members, their strength is to be checked using the stress given below

\[
\sigma_{eq} = \sqrt{\sigma_{max}^2 + 3\tau_{th}^2} \leq 0.75 \sigma_n \quad (3.6.4.11.9-2)
\]

where \( \sigma_{max} = 10 R_{up,cr} f_{up,cr} \cdot \left( M_0/W \right)^{1/3} \);

\( M_0 \) and \( N_0 \) = maximum bending moment, in \( \text{kN.m} \), and shear force, in \( \text{kN} \), due to transverse load;

\( W \) = actual section modulus of the upper cross member, in \( \text{cm}^3 \);

\( f_{up,cr} \), \( f_s \) = full sectional area of the upper cross member and sectional area of the cross member web, in \( \text{cm}^2 \).

10 Where no upper cross members are fitted at a deck level in line with transverse ring structures, a part of the coaming structure with the upper portion of the side buoyancy space located at 0,1\( D \) below the deck line (Fig. 3.6.4.11.10) is to have a section modulus \( W \), in \( \text{cm}^3 \), about a horizontal axis not less than:

\[
W = \frac{550 R_{up,cr} (l_b - b)^2}{6 \sigma_n} \delta_c. \quad (3.6.4.11.10-1)
\]

The thickness of the deck plating \( s \), in mm, is not to be less than:

\[
s = \frac{1.11 R_{up,cr} (l_b - b)}{b \delta_n} + \Delta s \quad (3.6.4.11.10-2)
\]

where for \( B_h \), see Fig. 3.6.4.11.10.

![](image)

Fig. 3.6.4.11.10

.11 The scantlings of hull structural items in places where hinges and hydraulic presses are arranged are to be determined by direct calculation as regards the action of statical and dynamical forces in compliance with 3.6.3.16.

The calculations are to be submitted to the Register for consideration.

.12 Hydraulic presses are to be positioned in special spaces at the hopper ends. The strength calculation of foundations and attachments of hydraulic presses is to be made as regards the action of forces determined in accordance with 3.6.4.11.11 and is subject to consideration by the Register.

3.6.4.12 Specific structures of floating cranes:

1 The diameter of the tub \( D_0 \), in m, at the upper deck beneath the fixed tower supporting the upper structure of the crane is not to be less than:

\[
D_0 = 0.37 M / P \quad (3.6.4.12.1)
\]

where \( M \) = total bending moment due to load and weight of the movable upper structure of the crane, applied to the supporting tower, in \( \text{kN.m} \);

\( P \) = total vertical force due to load and weight of the movable upper structure of the crane, applied to the supporting tower, in \( \text{kN} \).

2 The thickness of the tub plating, in cm, at the upper deck is to be determined by calculation based on the total bending moment according to 3.6.4.12.1 and a horizontal component of the load for the case when a design safe working load of the crane with the lifting height from the water level at the maximum outreach is used.

Permissible stresses for normal strength steel are not to be more than: \( \sigma = 140 \text{ MPa} \) and \( \tau = 80 \text{ MPa} \).

The buckling strength of the tub plating over its entire height is to be assured to the value \( \sigma_{cr} = 2.5 R_{eh} \). The calculations are to be submitted to the Register for consideration.

3 The inertia moment \( I_{min} \), in \( \text{cm}^4 \), of the tub vertical stiffeners (if any) is not to be less than:

\[
I_{min} = (1.03l - 1.80y)s^3 \quad (3.6.4.12.3)
\]

where \( l \) = stiffener span measured between the bottom and the platform or between the platform and the deck, whichever is the greater, in m. Where the platform is omitted, the distance between the bottom and the deck is measured;

\( y \) = spacing of stiffeners, measured along the chord line, in m;

\( s \) = tub plating thickness at the stiffener mid-span, in mm.

4 The plating thickness of the bulkheads forming a cross and the bearing contour is not to be less than determined according to 2.7.4.1, assuming \( k_c = 0.70 \), \( \Delta s > 4 \text{ mm} \) for bulkheads forming the cross and \( \Delta s > 2 \text{ mm} \) for those forming the bearing contour.

For cranes having a safe working load more than 100 t, the stressed condition of framing members and plating of bulkheads forming the cross under the
loads transferred from the fixed supporting tower in case of using the design safe working load at the maximum outreach is to be checked according to the procedure approved by the Register.

5 The plating thickness of the upper deck and the bottom $s'$, in mm, in way of the crane tub is not to be less than:

$$s' = \alpha s$$  \hspace{1cm} (3.6.4.12.5)

where $s$ = as defined in 3.6.4.12.2;

$\alpha = 0.6$ and 0.4 for the upper deck plating and bottom plating, respectively.

The dimensions of the plates of increased thickness are to be taken in accordance with Fig. 3.6.4.12.5.

---

3.6.5 Special requirements.

3.6.5.1 Where vessels are intended to ground during the course of normal service, the bottom of such vessels is to be suitably strengthened.

1 The thickness of the bottom shell plating is to be increased by 20 per cent over the minimum requirement.

2 Where the double bottom is omitted and transverse framing system is adopted, the bottom shell plating between the bottom side girders is to be strengthened by horizontal stiffeners.

In line with horizontal stiffeners vertical stiffeners are to be fitted. The horizontal stiffeners are to pass through openings in the floors and to be welded to them.

3 Where double bottom is omitted and longitudinal framing system is adopted, the bottom shell plating is to be strengthened by additional floors, the depth of which is to be not less than 2.5 times the depth of the bottom longitudinal and a thickness equal to that of the main floors. The main floors are to be strengthened by vertical stiffeners fitted in line with bottom longitudinals. Side girders are not to be spaced more than 2.2 m apart. The scantlings of bilge longitudinals are not to be less than those required for the bottom.

4 In transversely framed double bottom plate floors are to be fitted at every frame, side girders are to be spaced not more than 2.5 m apart, they are to be also fitted inboard or from longitudinal bulkheads at a distance not exceeding 2.5 m. The bottom shell plating is to be strengthened by horizontal stiffeners fitted between the side girders. Vertical stiffeners are to be fitted in line with horizontal stiffeners at every floor and be welded to them.

In longitudinally framed double bottom floors are to be fitted at every second frame, and side girders are to be spaced 2.5 m apart.

5 In way of a recess for vertical girders of suction tubes, the following hull strengthening is to be provided:

- side framing is to be reinforced by at least three web frames, the scantlings of which are to be the same as those required for the engine room, and by not less than three intercostal side stringers extending for three spacings from the extreme web frames which are to be fitted not less than 50 mm from the edge of the recess;

- side shell plating in way of the recess is to be made of a curved welded-in plate, the vertical butt joint of this plate is to be not less than 100 mm from the edge of the recess;

- the thickness of the deck stringer in way of the recess is to be increased by 60 per cent over the length equal to one spacing forward and abaft of web frames.

3.6.5.2 The requirements of 3.6.5.1 are not to apply to floating cranes for which deep sea service is specified and which are not likely to ground under any conditions of heel and trim.

3.6.5.3 The thickness of main structural items which are particularly subjected to abrasive wear due to the effect of spoil/water mixture (in particular, in case of special dredging methods used) is to be increased. These items may be made of special wear-resistant materials subject to special agreement with the Register.

3.6.5.4 Dredging pumps are to be located in special spaces bounded by watertight bulkheads.

3.6.5.5 The scantlings of deck framing members on deck portions where heavy dredging (cargo handling) gear is installed, as well as where large heavy cargoes may be carried on decks of floating
cranes or hopper dredgers are to be determined by calculation for the following conditions:

beams are considered to be rigidly fixed to the supporting structure;

a load (concentrated, partially distributed, etc.) is to be taken into account;

equivalent stresses for items made of normal strength steel $\sigma_{eq}$, in MPa, are to comply with the condition

$$\sigma_{eq} = \sqrt{\sigma^2 + 3\tau^2} \leq 170$$

where $\sigma$ and $\tau$ = normal and shear design stresses at the section under consideration.

The results of the calculation are to be specially considered by the Register.

3.7 FISHING VESSELS AND SPECIAL PURPOSE SHIPS USED FOR PROCESSING OF SEA LIVING RESOURCES

3.7.1 General and symbols.

3.7.1.1 The requirements of this Chapter apply to fishing vessels having a stern trawling arrangement or a side trawling arrangement and to special purpose ship intended for processing, storage and/or transportation of catch.

3.7.1.2 The requirements for hull structures not referred to in this Chapter are given in Sections 1 and 2. In no case shall the requirements for hull structures be less stringent than those contained in Sections 1 and 2.

3.7.1.3 Symbols:

$b_{sr}$ = breadth of stern ramp, in m;

$G_1$ = greatest specified mass of catch which can be handled by a special wheeled device or another transport means, in t;

$G_2$ = mass of moving part of special wheeled device or another transport means, in t;

$G$ = mass of processing equipment, in t;

$S_d$ = factory deck area, in $m^2$;

$a$ = spacing of framing members under consideration, in m;

$l$ = span of member under consideration (see 1.6.3.1);

$h$ = height of design load distribution on a member;

$A_s$ = corrosion and wear allowance added to plate thickness, in mm (see 1.1.5.1);

$\omega_s$ = factor taking account of corrosion allowance to the section modulus of the to framing member (see 1.1.5.3).

3.7.1.4 The requirements for ships mooring at sea provide for a damping protection of the hull for which purpose pneumatic fenders or other equivalent damping arrangements may be used. These require-ments are based on the assumption that ships would be moored at a sea state not above 6.

3.7.1.5 The regions of side strengthening of fishing vessels and special purpose ships mooring at sea.

3.7.1.5.1 Depth dimension

Region A lying between the line drawn lower than the ballast waterline by the value of $h$ and the line drawn higher than the summer loadline by the value of $h$. The value of $h$ is to be determined from Table 3.7.1.5.1.

<table>
<thead>
<tr>
<th>Sea force No.</th>
<th>$h$, in m</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\leq 4$</td>
<td>0.8</td>
</tr>
<tr>
<td>5</td>
<td>1.2</td>
</tr>
<tr>
<td>6</td>
<td>2.0</td>
</tr>
</tbody>
</table>

Region B lying between the upper boundary of region A and upper deck.

Region C lying between the upper deck and the first tier superstructure deck, forecastle and poop included.

3.7.1.5.2 Lengthwise, region A lies between sections in which the ship breadth at summer loadline level is equal to ($B - 3$ m).

In special purpose ships, region A is to extend for at least 0.36$L$ forward and aft from the midship section.

3.7.1.5.3 For special purpose ships, one or more fender areas are to be additionally established the boundaries of which are formed by sections lying within 0.05$L$ forward and aft of the forward and aft edges accordingly of a group of floating fenders providing one mooring place for all specified variants of mooring. The boundaries of fender areas are to be determined at extreme positions of fenders and for all specified variants of mooring.

3.7.1.6 Fishing vessels intended for systematic operation in ice conditions

3.7.1.6.1 Fishing vessels intended for systematic operation in ice conditions are to have an ice category not lower than 37Y3 in accordance with the requirements of Chapter 3.10.

3.7.1.6.2 Fishing vessels intended for systematic operation in ice conditions, which have the ice category 37Y3, are to comply with the requirements of Chapter 3.10, as well as with additional requirements contained in paras 3.7.1.6.4, 3.7.2.6, 3.7.3.4 and 3.7.4.5.

3.7.1.6.3 No additional requirements are put forward with regard to the ice strengthening of category 37Y4 or above.

3.7.1.6.4 If the loadline entrance of a fishing vessel of category 37Y3 exceeds 0.25$L$, an intermediate region of ice strengthening may be established the boundaries of which are to be determined as in the case of a category 37Y4 vessel.
3.7.2 Construction.
3.7.2.1 Stern ramp construction.
.1 The after end structure of vessels having a stern ramp and/or stern trawling arrangements is to be strengthened by fitting additional longitudinal and transverse members (girders, transverses, cross ties, bulkheads and partial bulkheads).

The stern ramp is to be so constructed as to avoid flat of bottom in way of stern counter.

The connection of stern ramp sides to transom plating and of the ramp deck to bottom plating are to have a radius of rounding not less than 200 mm. This connection may be made by using a bar not less than 70 mm in diameter.

.2 Stern ramp sides are, in general, to be carried downwards to the shell plating and forward to the after peak bulkhead and are to be smoothly tapered into deck girders and transverses.

.3 Where the catch is dragged onto the deck, it is recommended that the stern ramp be longitudinally framed with transverses fitted at intervals not exceeding four frame spacings. The stern ramp longitudinals are to be spaced not more than 600 mm apart.

In vessels where special transport means are used to carry the catch onto the deck, the stern ramp is to be framed transversely.

3.7.2.2 The construction of ships having a side trawling arrangement.
.1 It is recommended that vessels more than 30 m in length be fitted up with a forecastle.

.2 Within the location of each gallow, determined as the distance between sections at three spacings forward and aft of the gallows ends, the strengthening shall be as follows:

intermediate frames are to be fitted extending from the upper deck down to a level not less than 0.5 m below the ballast waterline and having a section modulus not less than 75 per cent of that required by 2.5.4.2 for the frames in the ‘tween deck space concerned;

the upper and lower ends of intermediate frames are to be secured to the decks, platforms and longitudinal intercostal members fitted between the main frames; longitudinal intercostal members are to have the same section as intermediate frames and be aligned with them; the upper longitudinal intercostal member is to be fitted not more than 350 mm below the upper deck;

bulwark stays are to be fitted at every frame.

3.7.2.3 Structures in processing shops.
.1 Where the number of bulkheads in the processing shops located above the bulkhead deck is less than specified in 2.7.1.3 and where the distance between the bulkheads forming the boundaries of that space exceeds 30 m, partial bulkheads extending inboard for not less than 0.5 m of the ‘tween deck height are to be fitted on the bulkhead deck at each side of the vessel in line with watertight bulkheads. The thickness of the partial bulkhead plating is to be not less than that of the top strake of the corresponding watertight bulkhead below the deck where the considered processing shop is located.

Partial bulkheads are to be strengthened with horizontal stiffeners in accordance with 1.7.3.2. Strengthening with vertical stiffeners is permitted with fitting the horizontal stiffeners between the side shell and the nearest vertical stiffener in compliance with 3.7.2.5.4.

Partial bulkheads are to be interconnected with deck transverses supported by pillars in a required number. Alternative structural arrangements may be used if approved by the Register as equivalent.

.2 Where multi-tier deckhouses are arranged above the processing shops, the requirements of 2.12.5.2 for rigid members (bulkheads, partial bulkheads) to be fitted in such spaces are to be complied with.

3.7.2.4 In fishing vessels, bulwark stays are to be fitted at intervals equal to not more than two frame spacings.

3.7.2.5 Structural strengthening of ships mooring at sea.
.1 In regions strengthened for mooring at sea, transverse framing is to be adopted for the vessel’s sides. In single-deck ships, the deck and bottom in the above regions are also to be framed transversely. In multi-deck ships, transverse framing is to be adopted for the deck located on the fender level. Longitudinal framing of sides is permissible in the upper ‘tween deck space only. In this case, the spacing of web frames is not to exceed three frame spacings or 2.4 m, whichever is less.

.2 In the region A, intermediate frames are recommended through the region length in fishing vessels and within fender areas in special purpose ships.

.3 In any case, it is recommended that symmetrical sections be used and the minimum possible web depth be ensured for the particular section modulus.

.4 Between the ship’s side and vertical stiffener nearest to it, transverse bulkheads are to have horizontal stiffeners with a section height not less than 75 per cent of the vertical stiffener height. In ships with \( L \leq 80 \) m, horizontal stiffeners are to be spaced not more than 600 mm apart, and with \( L \geq 150 \) m, not more than 800 mm apart. For ships of intermediate lengths, linear interpolation may be used to determine this distance. The ends of horizontal stiffeners are to be welded to vertical stiffeners and spliced at the ship’s sides.

.5 The bulwark is to be inclined towards the centre line of the ship at not less than one-tenth or be
fitted inboard of the ship’s side at not less than one-tenth of its height.

.6 Bilge keels of ships with the length \( L \leq 80 \) m are to be, as far as practicable, so arranged that a tangent drawn to the frame and passing through the outer free edge of the bilge keel would form an angle of not less than 15 deg with the vertical axis. For ships with the length \( L \geq 150 \) m, this angle may be zero. For ships of intermediate lengths, the above angle is to be obtained by linear interpolation.

.7 The lower end attachments of hold frames are to be as required by 2.5.5.1.

In ’tween decks, the attachments of frame lower ends are to comply with the requirements of 2.5.5.3. The frame ends are to be welded to the deck plating.

Upper ends of frames are to be carried to the deck plating and welded thereto. Beams are to be carried to the inner edges of frames with a minimal gap. Beam knees are to have a face plate or flange.

The ends of intermediate frames are to be attached to longitudinal intercostals, decks or platforms.

.8 Side longitudinals are to be attached to transverse bulkheads with knees. The height and width of the knees are to comply with 1.7.2.2.

.9 Bulwark stays welded to sheerstrake are to be so constructed as to prevent deck plating damage in case of bumping.

3.7.2.6 Besides the requirements of Chapter 3.10, the ice-strengthening structure of fishing vessels of category JY3 intended for systematic operation in ice conditions is to comply with the following requirements.

.1 For the case of transverse main framing, at least one load distributing side stringer should be fitted in each grillage in way of region of ice strengthening AI, AII, BI, CI.

.2 Bulbous forebody is not recommended.

.3 In the forepeak, the spacing of stringers and their dimensions, as well as stem dimensions, are to be in accordance with the requirements of Chapter 3.10 for ships of category JY4.

.4 In the afterbody, provision should be made for an appendage (ice knife) aft of the rudder to protect the latter on the sternway.

3.7.3 Design loads.

3.7.3.1 Design loads on ramp structures.

.1 The design pressure \( p \), in kPa, on the ramp sides and deck in vessels where the catch is dragged in is to be determined using the formula

\[
p = 6.5b_{hy}
\quad (3.7.3.1-1)
\]

Where the breadth of the ramp varies along its length, the minimum breadth is to be taken as the design value.

.2 In vessels equipped with a special wheeled catch-transport arrangement, the design load \( p \), in kN, for ramp deck plating is to be determined from the formula

\[
p = 27 \frac{G_1 + G_2}{n_w}
\quad (3.7.3.1-2)
\]

where \( n_w \) = number of the wheel axes of the arrangement.

3.7.3.2 For factory decks, the design pressure \( p \), in kPa, is to be determined from the formula

\[
p = 15 \frac{G}{S_d}
\quad (3.7.3.2)
\]

3.7.3.3 The design pressure \( p \), in kPa, on the sides and superstructure sides of ships moored at sea is to be obtained from the following formulae:

in the region A

\[
p = z_2z_3(190 + 51\sqrt{z-10^{-3}} - 0.464)
\quad (3.7.3.3-1)
\]

in the regions B and C

\[
p = z_2z_3(129 + 59\sqrt{z-10^{-3}} - 0.464)
\quad (3.7.3.3-2)
\]

where \( z_2 \) is to be adopted from Table 3.7.3.3-1 depending on the ship displacement and the sea conditions specified for mooring at sea; \( z_3 \) is to be adopted from Table 3.7.3.3-2 depending on the ship purpose and the region of strengthening;

\( A \) = design ship displacement, in t. For a fishing vessel \( A \) = displacement to the summer loadline. For a special purpose ship \( A \) = displacement of the largest ship mooring alongside. In any case \( A \) is not to be taken greater than 7500 t and smaller than 464 t;

\( n \) = number of moorings, during a voyage, alongside the ship whose displacement has been adopted as the design value in Formulae (3.7.3.3-1) and (3.7.3.3-2);

\( z \) = distance in m, from the mid-span of member calculated to the summer loadline.

Where a special purpose ship has the freeboard depth \( b_h \) greater than the freeboard depth \( b_h \) of the ship whose displacement has been adopted as the design value in Formulae (3.7.3.3-1) and (3.7.3.3-2), the value of \( z \) is to be reduced by the difference of \( (b_h - b_h) \).

In any case, \( z > 1.0 \); in the region A, \( z = 1.0 \).

| Table 3.7.3.3-1 |
|---|---|---|
| Ship displacement, in t | Sea state No. |
| \( \leq 2000 \) | 4 | 5 | 6 |
| \( > 2000 \) | 0.82 | 1.00 | 1.00 | 1.60 | 1.16 |

| Table 3.7.3.3-2 |
|---|---|---|
| Region of strengthening | Fishing vessel | Special purpose ship |
| Region A | 1.00 | 0.8 |
| Region A within fender area | \( - \) | 1.1 |
| Region B | \( 0.222 + 0.6 \) | \( 1 + 0.05a^{1/3} \) |
| Region C | \( 0.122 + 1.28 \) | \( 0.122 + 1.28 \) |

\( a \) = number of moorings, during a voyage, alongside the ship whose displacement is adopted for the design value in Formulae (3.7.3.3-1) and (3.7.3.3-2).

Note. In the regions B and C, \( z_2 \) is assumed between 1.1 and 1.4.
3.7.3.4 For fishing vessels of category \textbf{LY3} which are intended for systematic operation in ice conditions, the ice load parameters are to be determined on the basis of the following provisions.

1. In the forward region of ice strengthening (A), the load parameters are to be determined in accordance with the requirements of Chapter 3.10 for the ice category \textbf{LY3}. In the case of a bulbous forebody, the rake angle of frame is to be determined as stipulated in 3.10.3.2.1 for ships of category \textbf{LY4}.

2. In the intermediate region of ice strengthening (A1), the ice load parameters are to be taken equal to:

\[
p_{A1} = 0.75p_{A1}
\]
\[
p_{A1H} = 0.75p_{A1H}
\]
\[
b_{A1} = b_A
\]
\[
\bar{b}_{A1} = \bar{b}_A
\]

where \(p_{A1}\), \(p_{A1H}\), \(b_A\), \(\bar{b}_A\) — ice load parameters for the forward region (A), as determined in accordance with the requirements of Chapter 3.10, with due regard for para 3.7.3.4.1.

3. In the midship region of ice strengthening (B), the ice load intensity, in kPa, is determined by the formula

\[
p_{BH} = p_{BH}k_B
\]

where \(p_{BH}\) — ice load intensity in midship region according to 3.10.3.2.3; \(k_B = 2k_1\), but not less than 1;
\[
k_1 = \frac{r^2}{\sqrt{3000}} (k/L - 0.18);
\]
\[
r = \frac{12Ap_{C1}^2}{57.5P_{C1}^{(3/2)}} B_s
\]

where \(A\) — displacement, in t, to summer loadline; \(P_s\) — shaft power, in kW, determined with due regard for power take-off in the trawling condition; \(l_d\) — distance, in m, from forward perpendicular to a section aft where the reduction of summer loadline breadth begins.

The height and length (\(h_B\) and \(\bar{h}_B\)) to which the midship region is covered by the ice load are to be determined in accordance with 3.10.3.3.3 and 3.10.3.4.3.

4. The ice load intensity, in kPa, in the aft region of ice strengthening (C) is determined by the formula

\[
p_{C1} = p_{C1}k_c
\]

where \(p_{C1}\) — ice pressure in the aft region according to 3.10.3.2.4; \(k_c = 2.5k_1\), but not less than 1;
\[
k_1 = \text{see 3.7.3.4.3}.
\]

The height and length (\(h_B\) and \(\bar{h}_B\)) to which the aft region is covered by the ice load are to be determined in accordance with 3.10.3.3.4 and 3.10.3.4.4.

3.7.4 Scantlings of structural members.

3.7.4.1 Requirements for the scantlings of stern ramp framing.

1. The section modulus of longitudinals, beams and deck transverses of the stern ramp is to be determined according to 1.6.4.1, taking

\[p = \text{as obtained from (3.7.3.1-1) or (3.7.3.1-2)}\]
\[m = \text{as determined from Table 3.7.4.1.1 for vessels where the catch is dragged in}\
\[m = 9,3L^{(1/4)}a^{(1/2)} \text{for vessels where the catch is carried onto the deck by a special wheeled arrangement;} \]
\[k_c = 0.6. \]

<table>
<thead>

<td>11.3</td>
<td>7.9</td>
<td></td>
</tr>
<tr>
<td>Beams and deck transverses</td>
<td>12.6</td>
<td>8.8</td>
<td></td>
</tr>
</tbody>
</table>

2. The section modulus, in \(\text{cm}^3\), of stern ramp side stiffeners is not to be less than determined from 1.6.4.1 with the design load \(p\) as determined from (3.7.3.1-1), \(k_c = 0.9\), \(m = 17.0\), or 22.6 for fishing vessels and special purpose ships respectively. The stiffener span \(l\) is to be adopted equal to the maximum distance between the ramp deck and the nearest deck above or to the distance between two decks adjoining the ramp side, but is not to be less than 2.6 m.

In vessels engaged in pelagic fishing, the section modulus of ramp side stiffener, in \(\text{cm}^3\), is not to be less than:

\[W = 45.5 \left(1 - \frac{0.5}{T}\right) \frac{820}{\sigma_n} \frac{l}{d} \omega_c.\]

In no case shall the section modulus of stern ramp side stiffeners be less than required in 2.5.4.2 for the frames of upper ‘tween deck and superstructure.

3. The length of thickened ramp deck plating sections along the ramp length should equal:

- the ramp width at least, if measured forward of the ramp edge, in way of bottom rounding;
- double ramp width at least in way of top rounding.

4. Where the connection of the ramp side with transom plating is rounded, the thickness of the plating strake not less than 700 mm broad, if measured from the ramp deck plating, is not to be less than 20 mm. Doubling plates are also permitted.

If a welded half-round bar not less than 70 mm in diameter is fitted to the junction of the rounding and the flat part of the side, but not farther than 200 mm from the transom, the plating thickness may be adopted in accordance with the requirements of 3.7.4.1.6.

5. For vessels not engaged in pelagic fishing, the plating strakes of ramp sides are to be thickened, in
way of connection with the transom and along the ramp deck, to a value not less than required under 3.7.4.1.6.

The thickened side plating strakes fitted along the ramp length should have a breadth not less than 0.4 of the ramp breadth, or 1.0 m, whichever is greater. The lower edge of those strakes is to coincide with the ramp deck in vessels where the catch is dragged in and to be level with the catch stowage surface in vessels where the catch is carried onto the deck by a wheeled arrangement.

If measured forward of the rounding-to-flat-side-junction line, the length of thickened section of the side plating in way of transom is not to be less than 0.5 of the ramp breadth.

.6 For vessels where the catch is dragged in, the plating thickness of ramp deck and sides, in mm, is not to be less than determined from Formula (1.6.4.4), taking:

\[ m, \Delta s = \text{to be adopted from Table 3.7.4.1.6;} \]
\[ p = \text{as determined from Formula (3.7.3.1-1);} \]
\[ k_e = 0.8; \]
\[ k = 1.0. \]

Table 3.7.4.1.6

.9 Whatever the mode of carrying the catch along the stern ramp, the thickness of ramp plating in vessels of all types is to be 2 mm greater than required by 2.2.4.8 for the shell plating. This thickness should be maintained on the length from the stern ramp end to a line at least 600 mm above the bulkhead deck within the particular section of the vessel length. Forward of this region the thickness of stern ramp plating is to be 2 mm greater than required under 2.6.4.1.5 for the upper deck plating at ends.

.10 On a length at least 1.0 m forward of the stern ramp edge and at least over the whole ramp breadth, the stern-counter plating shall be 1 mm thicker than stipulated under 2.2.4.1.

3.7.4.2 Requirements for the member scantlings of vessels having a side trawling arrangement.

.1 In vessels over 30 m in length, the side plating and sheerstrake thickness between the gallow, determined as the distance between the section three spacings forward of the fore end of forward gallow and the section three spacings abaft the after end of after gallow, shall be 1 mm greater than stipulated under 2.2.4.1.

.2 Within the location of each gallow, to be determined in accordance with 3.7.2.2.2, provision should be made for strengthening as follows:

- sheerstrake thickness to be increased by 2 mm;
- thickness of strake adjacent to sheerstrake to be increased to equal that of the sheerstrake between gallow;
- deck stringer thickness to be increased by 3 mm as compared to that required by 2.6.4.1;
- bulwark plate thickness to be increased by 2 mm as compared to that required by 2.14.4.1.

3.7.4.3 Requirements for member scantlings of holds and fish handling spaces.

.1 The section modulus of factory deck beams and longitudinal is to be determined as required by 2.6.4 with the design pressure according to 3.7.3.2 where it exceeds that required by 2.6.3.

.2 In holds and fish handling spaces in which non-packed salted catch or salt is stored or which are exposed to the detrimental effect of catch wastes and sea water, the plating thickness is to be increased by 1 mm as compared to that required by the relevant sections of the Rules. Where the structure is so influenced from both sides, relevant thickness is to be increased by 2 mm.

.3 The vertical web plate thickness of coamings not acting as deck girders is not to be less than the deck plating thickness, or 7 mm, whichever is greater.

3.7.4.4 Requirements for member scantlings of ships mooring at sea.

.1 The side plating and sheerstrake thickness of ships below 80 m in length shall be by 1 mm greater than required under 2.2.4.8.
.2 In strengthened regions, the side plating and sheerstrake thickness, in mm, is not to be less than:

\[ s = 21.7a \sqrt{\frac{F_p}{k_p R_{sh}}} - 0.242 + \Delta s \]  

where \( a \) = frame spacing, in mm. If panting frames are provided, 
\( a \) is the distance between main and panting frames;
\( p \) = as defined under 3.7.3.3;
\( k_p = 1.1; \)
\( \Delta s = 4.0 \text{ mm for region A in case trawling is effected from the vessel side;} \)
\( \Delta s = 1.2 \text{ mm for regions B and C;} \)
\( \Delta s = 3.0 \text{ mm elsewhere.} \)

.3 In region A, the section modulus of frames, in cm³, is not to be less than:

\[ W = \frac{pab(2l-b)a_k}{mk_aR_{sh}} \cdot 10^3 \]  

where \( p \) = as determined from Formula (3.7.3.3-1);
\( a \) = spacing, in m, of main frames;
\( b = 1.5 \text{ m; } \)
\( m = 20.4 k_2\left(1+k_4k_4\right); \)
\( k_1, k_2 \) and \( k_3 \) should be adopted from Table 3.7.4.4.3 proceeding from the number of load distributing side stringers fitted;
\( k_4 = 0 \text{ when no panting frames are fitted;} \)
\( k_4 = 0.69 \text{ if panting frame ends terminate at longitudinal intercostal members;} \)
\( k_4 = 1.0 \text{ if the end attachments of main and panting frames are similar; } \)
\( a = 1.1; \)
\( l = \text{ frame span, in m, as measured along the chord between the upper edge of inner bottom plating or floor face plate and the lower edge of deck at side (side stringer where web frames are fitted).} \)

.4 In regions B and C, the section modulus of frames, in cm³, is not to be less than determined from Formula (3.7.4.4.3). The value of \( p \) should be adopted from Formula (3.7.3.3-2). Where the actual shell plating thickness is greater than 8 mm, \( p \) may be reduced by the value

\[ \Delta p = \frac{2.9 + l^2}{al} R_{esh} \cdot 10^3 , \]

where \( s = \text{actual shell plating thickness, in mm, but not greater than 20 mm; } \)
\( l = \text{frame span, in m;} \)
\( R_{esh} = \text{yield stress, in MPa, of shell plating material;} \)
\( a = \text{main frame spacing, in m; } \)
\( b = 2.2 \text{ m;} \)

.5 If longitudinal framing system is applied for 'tween deck spaces, the section modulus, in cm³, of side longitudinals is not to be less than

<table>
<thead>
<tr>

\( \sigma = \frac{W}{W_{ss}} \) = section modulus ratio of load distributing side stringer and frame;
\( f = \text{distance, in m, between a section at the lower support of frame and a tangent to the frame contour in way of the section at the upper support, as measured normal to the tangent (see Fig. 3.7.4.4.3);} \)
\( f_1 = \text{maximum deflection of frame according to Fig. 3.7.4.4.3, in m.} \)
\[ W = 24 \frac{p a a_2}{R e H} \delta_c \]  
\[ (3.7.4.4.5) \]

where \( p \) = as determined from Formula (3.7.3.3-2);

\( a_2 \) = spacing, in m, of longitudinals;

\( \delta_c \) = web frame spacing, in m.

.6 Where superstructure sides of ships mooring at sea are inclined to the centre line at not less than \( \frac{1}{10} \) or fitted inboard at not less than \( \frac{1}{10} \) of their height, no additional strengthening as per 3.7.4.4 is required.

Where the inclination of superstructure sides to the vessel side or the distance between those and the vessel side is less than specified above, the strengthening of their frames and shell plating shall be determined by linear interpolation proceeding from the requirements of 3.7.4.4, 2.2.4.1 and 2.5.4.2.

3.7.4.5 The member scantlings in the ice strengthened regions of fishing vessels of the ice category J1Y3 which are intended for systematic operation in ice conditions are to be determined in accordance with 3.10.4 where the ice load parameters are as stipulated in 3.7.3.4, bearing the following specification in mind.

When determining shell plating thickness in the intermediate region of ice strengthening in accordance with 3.10.4.1, the annual average thickness reduction of shell plating as a result of corrosion wear and abrasion should be adopted as \( u = 0.25 \) mm/year.

3.7.5 Special requirements.

3.7.5.1 Stern ramp structure.

.1 Transom plating should be protected from excessive wear with half-round steel bars of at least 70 mm in diameter, which are to be fitted inclined and secured by welding.

.2 Half-round steel bars of at least 70 mm in diameter should be welded along the junction line of rounding and flat side, but not farther than 200 mm from the transom.

.3 In vessels engaged in pelagic fishing, stern ramp sides are to be stiffened with longitudinal half-round steel bars of at least 70 mm in diameter, welded to the sides and spaced not more than 200 mm apart. The edge of the upper bar is to be not less than 650 mm above the ramp deck plating.

.4 Suitable devices are recommended to prevent excessive wear of ramp plating with wire ropes when dragging the catch. Where the rated winch pull exceeds 30 kN on each wire rope, such devices are compulsory.

Devices preventing excessive wear of plating may be substituted by doubling plates in the thickened areas of top and bottom rounding over the full breadth of the ramp, and doubling strips at least 400 mm wide may be fitted at the sides over the rest of the ramp length.

3.7.5.2 Within the location of each gallow complying with 3.7.2.2.2, bulwark, shearstrake and shell plating above ballast waterline are to be protected with half-round steel bars fitted inclined and secured by welding.

3.7.5.3 In way of heavy items of machinery and equipment installed in fish handling spaces, extra strengthening of 'tween deck sides may be required by the Register where the 'tween deck height exceeds 3.5 m.

3.7.5.4 When determining the requirements for sternframe scantlings of ships having the length \( L \leq 60 \) m, the design length and width of a solid rectangular propeller post are to be those stipulated under 2.10.4.3, as increased by 10 per cent.

3.8 SUPPLY VESSELS

3.8.1 General.

3.8.1.1 The requirements of this Chapter apply to supply vessels. Structural items not covered by this Chapter are to comply with the requirements of Sections 1 and 2.

3.8.2 Construction.

3.8.2.1 Provision is to be made for longitudinal fenders. At the fore end sloped fenders are to be fitted between the longitudinal fenders.

3.8.2.2 Inner bulwarks (coamings) and other similar structures protecting deck cargoes are to be properly secured to deck framing members. The scantlings of the above structures are to be agreed with the Register.

3.8.2.3 Shell in way of stern rollers and in other high load areas is to be suitably reinforced.

3.8.2.4 In deck areas where concentrated loads are applied (e.g. drilling rig anchors), extra strengthening of decks is to be provided.

3.8.2.5 The sides of superstructures and the bulwark are to be inclined to the centre line of the vessel at not less than one-tenth or to be fitted inboard from the vessel's side at not less than one-tenth of their height.

3.8.2.6 The lower ends of stiffeners of the first tier front bulkheads are to be connected to the underdeck framing members by brackets. The lower ends of other stiffeners are to be welded to the decks. The upper ends of stiffeners are to be connected to the deck beams by means of brackets.

3.8.2.7 The stay of the bulwark welded to the shearstrake are to be so constructed as to prevent damage of deck plating is case of bumping.

3.8.2.8 Extra strengthening of a flat portion of the bottom in way of the stern may be required to take up loads induced by slamming.

3.8.3 Design loads.

3.8.3.1 Design loads on hull structures of supply vessels are to be taken in compliance with Sections 1 and 2.

3.8.4 Scantlings of structural members.

3.8.4.1 The thickness of the side shell plating is to be 1 mm greater than required by 2.2.4. In no case is the thickness of the side shell plating to be taken less than 9.0 mm.
3.8.4.2 The thickness of deck plating is to be determined from 2.6.4, but it is not to be less than 8.0 mm.

3.8.4.3 The scantlings of deck framing members are to be obtained as required by 2.6.4 with a design load corresponding to the specified value but not less than 35 MPa.

3.8.4.4 The scantlings of girders and pillars supporting these girders are to be suitable for the weight of the deck cargo, as well as for loads induced by towing winches, supports of separate cargo platforms and other concentrated loads. Account is to be also taken of a vertical and a horizontal components of inertia forces due to the vessel’s motions. As the first approximation, accelerations determined according to 1.3.3 may be used.

3.8.4.5 The section modulus of hold, ‘tween deck and forecastle frames is not to be less than that determined according to 3.7.4.4.4 using Formula (3.7.3.3-1) with \( p \) according to 3.7.3.3, \( x_1 = 1.16 \) and \( x_2 = 1.0 \). Factors \( x_2, \beta_1 \) and \( \beta_2 \) are taken from Table 3.7.3.3-3 as for the region A1.

3.8.4.6 The section modulus of stiffeners of the fronts, sides and after ends of the deckhouses situated on the forecastle deck is to be not less than that required by 2.12.4.5.2. The assumed head \( p \), in kPa, is not to be taken less than given in Table 3.8.4.6.

<table>

</table>

3.8.4.7 The plate thickness of the fronts, sides and after ends is to be taken not less than 6.5 mm for the first-tier front bulkhead and 6.0 mm for other bulkheads. These values are applicable in case of stiffener spacing 0.6 m. For stiffener spacings exceeding 0.6 m the thickness is to be increased in proportion to the increased spacings.

3.8.4.8 The plate thickness of the bulwark is to be at least 7 mm, and the width of the stiffener lower end measured along the weld is to be not less than 360 mm. The distance between stays is not to exceed two spacings or 1.3 m, whichever is the lesser.

3.8.5 Special requirements.

3.8.5.1 In vessels having a double skin construction, structures and scantlings of the inner skin framing are to comply with 2.5. Where the forces acting on the frames may be directly transmitted to the inner skin framing, the scantlings of these members are to be specially considered by the Register.

3.8.5.2 Scallops and one-sided welds are not to be used in connections with the side shell plating.

3.9 TUGS

3.9.1 General and symbols.

3.9.1.1 The requirements of this Chapter apply to all tugs irrespective of purpose or service area.

3.9.1.2 Structural items not covered by this Chapter are to comply with the requirements of Sections 1 and 2.

3.9.1.3 Symbols:

\[ b_s = \text{width of stem cross section, in mm}; \]

\[ l_s = \text{length of stem cross section, in mm}. \]

3.9.2 Construction.

3.9.2.1 Plate floors are to be fitted at each frame. Where the double bottom is omitted, the floors are to have a symmetrical face plate.

3.9.2.2 Where a main frame span exceeds 3.0 m, load distributing side stringers are to be fitted along the length of the ship except for the engine room.

3.9.2.3 In the engine room, web frames are to be fitted between the inner bottom (floor face plates) and the upper deck at a distance not exceeding four spacings. Web frames should be fitted at main engine ends.

3.9.2.4 A fender is to be fitted at upper deck and long forecastle deck level.

3.9.2.5 Areas to which concentrated loads are applied (e.g. due to towing winches) should be additionally strengthened.

3.9.2.6 The stems of harbour tugs should have rounded shape above the summer load waterline.

3.9.3 Design loads.

Design loads on hull structures of tugs should be assumed in compliance with the requirements of Sections 1 and 2.

3.9.4 Scantlings of structural members.

3.9.4.1 The minimum plating thickness of shell and upper deck as well as of watertight bulkheads is not to be less than 5 mm.

3.9.4.2 The thickness of shell plating adjacent to the stem is not to be less than stipulated under 2.2.4.6.

The shell plating thickness in way of the engine room, when located aft, is not to be less than required for the midship region.

3.9.4.3 When determining the section modulus of the web frames in accordance with 2.5.4.5, the distance measured from the inner bottom plating (floor upper edge) and the upper deck at side is to be taken as the design span.

3.9.4.4 The scantlings of load distributing side stringers should be determined in accordance with 2.8.2.7.

3.9.4.5 Within the region from the keel to the summer load waterline, the cross-section of a rectangular solid bar stem is not to be less than:

\[ l_s = 1.6L + 100; \]  \hspace{1cm} (3.9.4.5-1)

\[ b_s = 0.5L + 25. \]  \hspace{1cm} (3.9.4.5-2)
The scantlings and location of brackets for strengthening the stem should be determined proceeding from 2.10.4.1.3.  
The stem is to be extended abaft the fore peak bulkhead for not less than three spacings.  
Ship-handling tugs are not permitted to have reduced cross-section and scantlings of the stem (if constructed of steel plates) above the summer load waterline.  
The steel plates of the stem are to be strengthened over their length with horizontal brackets spaced not more than 0.6 m apart, the plate thickness of the stem determined in accordance with 2.10.4.1.2 being not reduced.  

3.9.4.6 Rectangular solid propeller posts are to have scantlings from the keel to the counter not less than:

\[ l_i = 1.5L + 100; \]
\[ b_i = 1.8L + 25. \]

The sternframe is to be attached according to 2.10.2.2.4 to two floors, whatever the length of the tug may be.  

3.9.4.7 The thickness of the bulwark plating is to be taken according to 2.14.4.1, but not less than 4 mm.  
The section modulus of bulwark stays should be determined in accordance with 2.14.4.2 where \( m = 1.5 \).  
Bulwark stays should be fitted not farther than at alternate frames. Bulwark stays welded to the sheerstrake plate may have a flexible element in their structure.  
The bulwark is to be inclined to the centre line of the vessel at not less than 7°.  

3.9.5 Special requirements.  
3.9.5.1 For unrestricted service tugs above 40 m in length, the number of watertight bulkheads is to be not less than four.

3.10 STRENGTHENING OF ICE SHIPS AND ICEBREAKERS

3.10.1 General provisions and requirements.
3.10.1.1 Application.  
.1 The requirements of this Chapter apply to self-propelled ice ships and icebreakers, as well as to ships which may be given the same status proceeding from the conditions of their ice navigation.  
.2 Self-propelled ice-strengthened ships which comply with the requirements of this Chapter are assigned an ice category mark in their class notation in accordance with 2.2.3, Part I "Classification".  
.3 Requirements of this Chapter are supplementary with regard to those of other chapters of the Rules which apply to a particular ship, and they establish the minimum strength level necessary to withstand ice loads, as well as hull structure, proceeding from the ice mark in the class notation.  
.4 The calculated dependences of this Chapter are directly applicable to those ice ships and ice-breakers only which have a standard hull form and which comply with the requirements of 3.10.1.2. The possibility of departing from the requirements of 3.10.1.2, as well as of using bow lines (spoon-like, multi-plane) other than standard ones, is subject to special consideration by the Register.  
.5 The service conditions for a ship are to be set down proceeding from its ice certificate compiled by a competent body with regard for hull form and structure, intended area, season and tactics of navigation of the particular ship.

3.10.1.2 Requirements for hull configuration.  
.1 The hull configuration parameters \( \alpha, \alpha_0, \beta, \varphi \), in deg., are to be measured in conformity with Figs 3.10.1.2-1 — 3.10.1.2-4.

Fig. 3.10.1.2-1:
\( \alpha \) - slope of summer load waterline at the section considered, deg

Fig. 3.10.1.2-2:
\( \beta \) - slope of frame on the level of summer load waterline at the section considered, deg

Fig. 3.10.1.2-3:
\( \alpha_0 \) - slope of summer load waterline at the forward perpendicular, deg.

1 - shell plating; 2 - stem
.2 The hull configuration parameters of ice class ships are to be within the limits stated in Table 3.10.1.2.2.

<table>
<thead>
<tr>
<th>Hull configuration parameter</th>
<th>Category of ice strengthening</th>

</tr>
<tr>
<td></td>
<td>( \varphi_5 )</td>
<td>50°</td>
<td>—</td>
</tr>
</tbody>
</table>

The construction water line projection upon a horizontal plane should cover the blade tips of side propellers.

The tip clearance is not to be less than stated in Table 3.10.1.2.3-2.

<table>
<thead>
<tr>
<th>Clearance, ( \text{mm} )</th>
<th>Category of icebreaker</th>

</tr>
<tr>
<td>750</td>
<td>( \varphi_6 )</td>
</tr>
<tr>
<td>500</td>
<td>( \varphi_7 )</td>
</tr>
</tbody>
</table>

.4 In the afterbody of icebreakers and \( \varphi_4, \varphi_5, \varphi_6, \varphi_7, \varphi_8, \varphi_9 \) category ships, provision should be made for an appendage (ice knife) aft of the rudder to protect the latter on the sternway.

.5 No transom stern (with the transom coming in the region of ice strengthening) is permitted for icebreakers and \( \varphi_6, \varphi_7, \varphi_8, \varphi_9 \) category ships. For \( \varphi_4 \) and \( \varphi_5 \) category ships having a transom stern, the value of ice loads upon the transom is subject to the special consideration of the Register.

.6 For icebreakers and \( \varphi_6, \varphi_7, \varphi_8, \varphi_9 \) category ships, provision should be made for a step in the lower part of the stem. The height of the step is to be 0.1\( \text{d} \) at least. The transition from the step to the lower part of the stem should be smooth.

3.10.1.3 Region of ice strengthening.

.1 The hull length is to be subdivided into regions of ice strengthening as follows:

- forward region — \( \text{A} \);
- intermediate region — \( \text{A}_1 \);
- midship region — \( \text{B} \);
- aft region — \( \text{C} \).

The hull depth and bottom are subdivided into regions of ice strengthening as follows:

- region of alternating draughts and similar regions — \( \text{I} \);
- region from the lower edge of region \( \text{I} \) to the upper edge of bilge strake — \( \text{II} \);
- bilge strake — \( \text{III} \);
- region from the lower edge of bilge strake to the centre line — \( \text{IV} \).

.2 The length of regions of ice strengthening in ice class ships is to be determined on the basis of Fig. 3.10.1.3.2 and Table 3.10.1.3.2.
**Region A for $\textbf{LY1, LY2, LY3}$ category ships**

- **I** — ice strake in the region of alternating draughts
- **II** — from the lower boundary of region I to the upper boundary of Region III
- **III** — bilge strake
- **IV** — flat bottom

$b$ — distance from the forward perpendicular to the section where the ice loadline is the widest, but not greater than $0.4L$.

**Notes**
1. For $\textbf{LY1}$ category ships, the lower boundary of the region A is by $h_3$ distant from the ballast waterline.
2. Point B is not to be further than the aft boundary of the region A.

Fig.3.10.1.3.2

</tr>
</tbody>
</table>

An ice loadline is to be determined as a loadline enveloping all the ship loadlines (heel disregarded) possible during ice navigation.

For $\textbf{LY1, LY2, LY3}$ category ships no intermediate region of ice strengthening will be established. In this case, it should be considered that the aft boundary of the forward region of ice strengthening coincides with the forward boundary of the midship region of ice strengthening.

3. The length of regions of ice strengthening in icebreakers is to be determined on the basis of Fig. 3.10.1.3.3 and Table 3.10.1.3.3.

4. Proceeding from the ice category, the requirements of the Chapter apply to the regions of ice strengthening marked with "$+$" in Table 3.10.1.3.4.
Fig. 3.10.1.3.3
Regions of ice strengthening of icebreakers

#### 3.10.2 Structure.

**3.10.2.1 Side grillage structure where transverse framing is used.**

1. A grillage may include vertical girders of main framing which are denoted as conventional frames, vertical web members which are denoted as deep frames, and longitudinals which are denoted as stringers.

   Conventional frames are subdivided into:
   - main frames lying on the same plane as floors or bilge brackets;
   - intermediate frames not lying on the same plane as floors or bilge brackets.

   The presence of intermediate frames within a grillage is not mandatory.

   Not more than one intermediate frame may be fitted between every two adjacent main frames.

   Stringers are subdivided into:
   - intercostal stringers by which joint taking-up of local ice loads by the frames is ensured. It is recommended that the stringers should be intercostal;
   - side stringers by which a transition of forces is ensured from conventional frames which directly take up the ice load to deep frames or to transverse bulkheads.

   Side grillage structures are permitted as follows:
   - grillage with transverse main frames which is formed by conventional frames of the same section and by intercostal stringers;
   - grillage with transverse web frames which is formed by conventional frames, side stringers and deep frames. Intercostal stringers may be fitted together with side stringers.

   With a double-bottom structure available, the functions of deep frames are taken over by vertical
diaphragms, and those of the side stringers, by horizontal diaphragms.

2 In icebreakers and \( \mathbf{L}_{0}^{5}, \mathbf{L}_{0}^{6}, \mathbf{L}_{0}^{7}, \mathbf{L}_{0}^{8}, \mathbf{L}_{0}^{9} \) category ships, frames are to be attached to decks and platforms with brackets; if a frame is intercostal in way of deck, platform or side stringer, brackets are to be fitted on both sides of it.

3 The end attachments of main frames are to comply with the requirements of 2.5.5. In icebreakers solid floors are to be fitted on each main frame. In \( \mathbf{L}_{0}^{8}, \mathbf{L}_{0}^{9} \) category ships, solid floors should be fitted on every other main frame.

The end attachments of intermediate frames are to comply with the following requirements.

In \( \mathbf{L}_{0}^{4}, \mathbf{L}_{0}^{5}, \mathbf{L}_{0}^{6}, \mathbf{L}_{0}^{7}, \mathbf{L}_{0}^{8}, \mathbf{L}_{0}^{9} \) category ships and icebreakers, the bottom ends of intermediate frames are to be secured at margin plate stiffened with a lightened margin bracket (or a system of stiffeners) reaching up to longitudinal stiffeners or intercostal members and welded thereto (Fig. 3.10.2.1.3-1).

Where there is no double bottom, the intermediate frames are to extend as far as longitudinal stiffeners or intercostal structure and welded thereto. The particular longitudinal stiffener or intercostal structure is to be fitted not higher than the floor face-plate level.

In \( \mathbf{L}_{0}^{1}, \mathbf{L}_{0}^{2}, \mathbf{L}_{0}^{3} \) category ships having transverse main framing, the bottom ends of intermediate frames may be secured at intercostal longitudinal fitted 1000 mm beneath the lower boundary of region I.

In \( \mathbf{L}_{0}^{1}, \mathbf{L}_{0}^{2}, \mathbf{L}_{0}^{3} \) category ships with deep framing, it is permitted to secure the bottom ends of intermediate frames, except for the region A of category \( \mathbf{L}_{0}^{3} \), at a longitudinal (which may be intercostal) fitted 1000 mm below the side stringer lying beneath the lower boundary of region I (Fig. 3.10.2.1.3-2). In this case, the web area and plastic modulus of the above side stringer are not to be less than required for a stringer fitted in region I.

In icebreakers and \( \mathbf{L}_{0}^{4}, \mathbf{L}_{0}^{5}, \mathbf{L}_{0}^{6}, \mathbf{L}_{0}^{7}, \mathbf{L}_{0}^{8}, \mathbf{L}_{0}^{9} \) category ships, the upper ends of intermediate frames are to be secured on a deck or platform lying above the upper boundary of region I. In \( \mathbf{L}_{0}^{1}, \mathbf{L}_{0}^{2}, \mathbf{L}_{0}^{3} \) category ships having transverse main framing, the upper ends of intermediate frames may be secured in way of an intercostal longitudinal fitted 500 mm above the upper boundary of region I.

In \( \mathbf{L}_{0}^{1}, \mathbf{L}_{0}^{2}, \mathbf{L}_{0}^{3} \) category ships with deep framing, the upper ends of intermediate frames may be secured in way of a longitudinal (which may be intercostal) fitted 500 mm higher than the side stringer lying above the upper boundary of region I (see Fig.3.10.2.1.3-2). In this case, the web area (and the ultimate section modulus of the above side stringer are not to be less than required for a stringer fitted in region I.

4 In regions I and II of icebreakers and \( \mathbf{L}_{0}^{4}, \mathbf{L}_{0}^{5}, \mathbf{L}_{0}^{6}, \mathbf{L}_{0}^{7}, \mathbf{L}_{0}^{8}, \mathbf{L}_{0}^{9} \) category ships, intercostal and/or side stringers should be fitted the distance between which or the stringer-to-deck or platform distance is not to exceed 2 m, as measured on a chord at side.

For region I of \( \mathbf{L}_{0}^{1}, \mathbf{L}_{0}^{2}, \mathbf{L}_{0}^{3} \) category ships, this distance is not to exceed 3 m.

Side stringers are to be fitted in the loadline and ballast water line regions. If there is a deck or platform lying on the same level, the side stringer may be omitted. Stringers are to be attached to bulkheads by means of brackets.
3.10.2.2 Determining the supporting sections of frames in grillages with transverse framing

1. The supporting sections of conventional and deep frames are to be found in supporting structures only.

For frames, horizontal grillages (decks, platforms, bottom) are considered to be supporting structures. A supporting structure consists of plating (decks, platforms, double bottom) and framing connected thereto (beams, half-beams, floors, tank-side brackets). Where there is no double bottom, the formulas to be found below should be used on the assumption that the plating lies level with floor face plates.

2. The supporting section of a conventional frame is considered to be fixed, if one of the following conditions is met at least:

   - the frame is connected to the framing of a supporting structure;
   - the frame crosses the plating of a supporting structure.

A supporting section is considered to be freely supported, if a conventional frame is not connected to supporting structure framing and is terminated on the structure plating.

Where a conventional frame terminates on an intercostal longitudinal (intercostal stringer), its end is considered to be free, i.e. no supporting section is available.

3. The position of a supporting section of a frame (conventional or deep frame) is determined in the following way.

   Where the frame is connected to the supporting structure plating only, the supporting section coincides with the plating surface.

   Where the frame is connected to the supporting structure framing, the supporting section:
   - coincides with the face plate surface of the supporting structure frame in case of bracketless joint;
   - lies at bracket end where brackets with a straight or rounded and stiffened edge are concerned;
   - lies in the middle of the bracket side where brackets with a rounded free edge are concerned.

4. When determining the conditions of fixation and the position of supporting sections in typical structures, one is to be guided by Table 3.10.2.2 (the position of a supporting section is indicated with an arrow in the sketches of the Table), as well as by the requirements of 3.10.2.2.2 and 3.10.2.2.3.

3.10.2.3 Side grillage structure where longitudinal framing is used.

1. A longitudinally framed side grillage structure is permitted which consists of longitudinals and web frames. Intercostal additional frames may be fitted between deep frames (see 3.10.2.3.3).

   In a double-side structure, the functions of deep frames are taken over by vertical diaphragms. Where a double-side structure includes horizontal diaphragms, they are considered to be platforms, and the requirements of 3.10.2.4 and 3.10.4.9 for platforms apply to them. Longitudinal framing system is not recommended for ice and LY5, LY6, LY7, LY8, LY9 category ships.

2. Longitudinals which are intercostal in way of plate structures (see 3.10.2.4) should be secured with brackets on both sides of the plate structure, and the webs of the longitudinals should be welded to the plate structure.

3. In icebreakers and LY4, LY5, LY6, LY7, LY8, LY9 category ships where the spacing of frames is greater than 2 m, additional frames should be fitted.
### Table 3.10.2.2

</tr>
</tbody>
</table>

The end fixation method is to be the same as in the case of intermediate frames of **LY1**, **LY2**, **LY3** category ships with transverse main framing in accordance with 3.10.2.1.3, irrespective of the ice category.

**3.10.2.4** Plate structures.

.1 By plate structures, the sections of deck, platform and double bottom plating, of transverse bulkhead plating, deep frame plates, stringers of side and bottom, centre-plane girder, solid and lightened plate floors and bilge brackets which adjoin the shell plating are meant.

.2 For hull members mentioned under 3.10.2.4.1, the areas to be covered by the requirements for plate structures will be established as follows:

- fore peak and after peak bulkheads of icebreakers and **LY5**, **LY6**, **LY7**, **LY8**, **LY9** category ships throughout their breadth; for ships of other categories, on a breadth of 1.2 m from the shell plating;
- other bulkheads in regions I and II of icebreakers and **LY4**, **LY5**, **LY6**, **LY7**, **LY8**, **LY9** category ships, decks and platforms of icebreakers and **LY4**, **LY5**, **LY6**, **LY7**, **LY8**, **LY9** category ships, on a breadth of 1.2 m from the shell plating;
- other hull members — on a breadth of 0.6 m from the shell plating.

.3 In the areas of plate structures mentioned under 3.10.2.4.2, corrugated structures with corrugations arranged along the shell plating (i.e. vertical corrugations on transverse bulkheads and longitudinal corrugations on decks or platforms) are not permitted.

.4 The plate structures of icebreakers, **LY5**, **LY6**, **LY7**, **LY8**, **LY9** category ships and region I of **LY4**...
category ships are to be provided with stiffeners fitted at right angles approximately to the shell plating. The stiffeners must be spaced not farther apart than stipulated in Table 3.10.2.4.4.

<table>
<thead>
<tr>
<th>Orientation of main framing fitted at shell plating</th>
<th>Maximum spacing of stiffeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icebreakers, (\mathbf{LV} 5) (region I), (\mathbf{LV} 6, \mathbf{LV} 7, \mathbf{LV} 8, \mathbf{LV} 9)</td>
<td>(a), but not greater than 0.5 m</td>
</tr>
<tr>
<td>(\mathbf{LV} 5) (except region I), (\mathbf{LV} 4) (region I)</td>
<td>(2a), but not greater than 1.0 m</td>
</tr>
<tr>
<td>Main framing lies across a plate structure</td>
<td>0.6 m</td>
</tr>
<tr>
<td>Main framing lies parallel to a plate structure</td>
<td>0.8 m</td>
</tr>
</tbody>
</table>

Note: \(a\) is the spacing of main framing girder, as measured on the shell plating.

The plate structures of \(\mathbf{LV} 1, \mathbf{LV} 2, \mathbf{LV} 3, \mathbf{LV} 4\) (except region I) category ships may be provided with stiffeners fitted in parallel approximately to the shell plating.

The intersections of plate structures with main framing should be executed in accordance with Table 3.10.2.4.5. The stiffeners by which the plate structure is strengthened and which lie on the same plane as the main framing girders are to be secured to the above girders. Other methods of attaching the webs of main framing girders to the plate structure may be applied, if found equivalent by the Register.

.6 Where main framing girders are intercostal in way of the plate structure, brackets are to be fitted on both sides of the structure on the same plane as each of the girders, and the girder webs are to be welded to the plate structure.

.7 The following requirements are put forward additionally for the intersections (connections) of the plate structures of decks and platforms with main framing.

Where transverse framing is used for sides, the frames should be attached to the beams with brackets. In \(\mathbf{LV} 5\) (region 1 only), \(\mathbf{LV} 6, \mathbf{LV} 7, \mathbf{LV} 8, \mathbf{LV} 9\) category ships, the girders are to be fitted on the same plane as each of the frames (see also Table 3.10.2.4.4).

In \(\mathbf{LV} 5\) (except region 1) and \(\mathbf{LV} 4\) (region 1) category ships, the frame on whose plane no girder is fitted should be secured to the plate structure with brackets which are to terminate on the intercostal stiffener.

Where longitudinal framing is used for sides, the girders should be attached to the shell plating with brackets reaching as far as the nearest longitudinal.

.8 The distance from the edge of opening or manhole to the shell plating is not to be less than 0.5 m in a plate structure. The distance from the edge of opening or manhole in a plate structure to the edge of opening for the passage of a girder through the plate structure is not to be less than the height of that girder.

3.10.2.5 Fore peak and after peak structure.

.1 A longitudinal bulkhead welded to the stem or sternframe is to be fitted on the centre line of the ship in the fore peak and after peak of icebreakers and

</table>

Note. Stiffeners of plate structure and brackets stipulated in 3.10.2.4 are not shown schematically in the sketches.
LY8, LY9 category ships, and the lower ends of all frames are to be connected to floors or brackets.

2 In the fore peak of icebreakers and LY5, LY6, LY7, LY8, LY9 category ships, platforms with lightening holes should be fitted instead of stringers and panting beams (see 2.8.2.3), the distance between platforms measured along a chord at side, is not to exceed 2.0 m. This structure is recommended for LY4 category ships as well.

3 In the after peak of icebreakers and LY5, LY6, LY7, LY8, LY9 category ships (see 2.8.2.10), side stringers and panting beams are to be fitted so that the distance between the stringers as measured along a chord at side, would not be greater than 2.0 m. The dimensions of stringer webs are not to be less than determined by the formulas:

- height \( h = 5L + 400 \text{ mm} \);
- thickness \( s = 0.05L + 7 \text{ mm} \).

Platforms with lightening holes are recommended instead of panting beams and stringers.

4 In icebreakers and LY6, LY7, LY8, LY9 category ships, the side stringers in the fore peak and after peak are generally to be a continuation of those fitted in the regions A and C (see 3.10.2.1.4).

5 In the case of LY4 category ships, the area and inertia moment of panting beams are to be increased by 25 per cent as compared to those required by 2.9.4. The dimensions of stringer webs should not be less than given by the formulas:

- height \( h = 3L + 400 \text{ mm} \);
- thickness \( s = 0.04L + 6.5 \text{ mm} \).

6 In the fore peak and after peak, the free edges of side stringers are to be stiffened with face plates having a thickness not less than the web thickness and a width not less than ten thicknesses. The interconnections of frames with side stringers are to be in accordance with Table 3.10.2.4.5, and brackets should be carried to the face plates of the stringers.

3.10.2.6 Stem and sternframe construction.

1 LY6, LY7, LY8, LY9 category ships are to have a solid section stem made of steel (cast steel is recommended). The stems and sternframes of icebreakers, as well as the sternframes of LY5, LY6, LY7, LY8, LY9 category ships, are to be made of forged or cast steel. Stems and sternframes welded of cast or forged parts are admissible.

2 In LY1, LY2, LY3, LY4, LY5 category ships, a stem of combined structure (a bar with thickened plates welded thereto) or plate structure may be used, and where the ship length is under 150 m with a sharp-lined bow, the stem design shown in Fig.3.10.2.6 may be used (the value of \( s \) is to be as determined by Formula (3.10.4.10.1-3).

In LY1, LY2, LY3, LY4 category ships, sternframes of combined structure may be used.

3 In LY1, LY2, LY3, LY4, LY5, LY6, LY7, LY8, LY9 category ships, the stem is, where practicable, to be strengthened by a centre line web having its section depth equal to \( h_b \) at least (see Table 3.10.4.10.1) with a face plate along its free edge or a longitudinal bulkhead fitted on the ship centre line, on the entire stem length from the keel plate to the nearest deck or platform situated above the level \( H_b \) referred to in 3.10.4.10 and in Table 3.10.4.10.1. The thickness of this plate should not be less than that of the brackets with which the stem is strengthened (see 3.10.2.6.4). In icebreakers and LY8, LY9 category ships, a longitudinal bulkhead may be substituted for the centre line web.

4 Within the vertical extent defined in 3.10.2.6.3, the stem is to be strengthened by horizontal webs at least 0.6 m in depth and spaced not more than 0.6 m apart. The webs are to be carried to the nearest frames and connected thereto. Where in line with side stringers, the webs are to be attached to them. In stems of combined or plate type, the webs are to be extended beyond the welded butts of the stem and shell plating. Above the deck or platform located, by the value of \( H_b \) at least, higher than the upper boundary of region I, the spacing of horizontal webs may gradually increase to 1.2 m in icebreakers and LY7, LY8, LY9 category ships, and to 1.5 m in ships of other categories.

The web thickness should be adopted not less than half the stem plate thickness. In icebreakers and LY4, LY5, LY6, LY7, LY8, LY9 category ships, the free edges of webs are to be strengthened with face plates welded to the frames at their ends. The side stringers of the fore peak are to be connected to the webs fitted in line with them.

In case of a full bow, vertical stiffeners may be required additionally to be fitted to the stem plates.

5 Where the stern frame has an appendage (ice knife), the clearance between the latter and the
rudder plate is not to exceed 100 mm. The appendage
should be reliably connected to the stern frame.
Securing the appendage to plate structures is not
permitted.

.6 In icebreakers, the lower edge of the solepiece is to
be constructed with a slope of 1:8 beginning from the
propeller post.

3.10.2.7 Bottom structure.

.1 In icebreakers and \( \text{LY5}, \text{LY6}, \text{LY7}, \text{LY8}, \)
\( \text{LY9} \) category ships, double bottom should be
provided between the fore peak bulkhead and the
after peak bulkhead.

.2 In icebreakers, provision should be made for
solid floors at each main frame, and in \( \text{LY8}, \text{LY9} \)
category ships, at each but one main frame.

.3 In regions of ice strengthening in way of
bottom, as established in accordance with
Table 3.10.1.3.4, bracket floors are not permitted.

.4 In icebreakers and \( \text{LY8}, \text{LY9} \) category ships
the centre-plane girder height is to be less than
given by the formula

\[ h = \varphi (9L + 800) \text{ mm}, \]  \hspace{1cm} (3.10.2.7.4)

where \( \varphi = 0.8 \) for \( \text{LY8} \) category ships;
\( \varphi = 0.9 \) for \( \text{LY9} \) category ships;
\( \varphi = 1 \) for icebreakers.

.5 In icebreakers and \( \text{LY8}, \text{LY9} \) category ships,
the spacing of bottom stringers is not to exceed 3.0 m.

3.10.2.8 Special requirements.

.1 In icebreakers, double side structure is
generally to be provided between the fore peak
bulkhead and the after peak bulkhead.

.2 In \( \text{LY7}, \text{LY8}, \text{LY9} \) category ships double side
structure is necessary for machinery room, and for
the region mentioned in 3.10.2.8.1 it is recommended.

.3 Where the web plate of a girder or a plate
structure is considerably inclined to the shell plating
(the angle between them being less than \( 50^\circ \)), the
framing normal to the shell plating or an inclined
plate structure is recommended (Fig. 3.10.2.8.3).
Otherwise, special measures must be taken to prevent
the collapsing of the girder or the bulging of the plate
structure.

3.10.3 Ice load.

3.10.3.1 Ice load is the approximate design
load upon the hull due to ice forces, by which the
level of requirements for scantlings is determined
proceeding from the ice category mark, hull shape
and ship displacement.

The ice load depends on three parameters:

- \( p \) — ice pressure being a characteristic of the
maximum pressure in the area of dynamic contact
between the hull and ice, in kPa;

- \( b \) — vertical distribution of ice pressure charac-
terizing the maximum transverse dimension of the
dynamic contact area between the hull and ice, in m;

\[ p = \frac{2500d_{1}v_{m}^{6} \varphi}{\rho_{AI}} \]  \hspace{1cm} (3.10.3.2.1)

where \( a_{1} \) — factor to be adopted from Table 3.10.3.2.1 proceeding
from the ice category;

\( \rho_{AI} \) — displacement to summer loadline, in t;
Table 3.10.3.2.1

<table>
<thead>
<tr>

<tr>
<td>a2</td>
<td>—</td>
</tr>
<tr>
<td>a3</td>
<td>—</td>
</tr>
<tr>
<td>a4</td>
<td>—</td>
</tr>
</tbody>
</table>

$v_m$— value of the shape factor $v$, which is the maximum one for the region, as determined at sections within $x=0$; 0.05$c$, 0.1$c$, etc., from the forward perpendicular on summer loadline level within the fore ran (as far as $L\leq L_1$, $L\geq L_2$, $L\leq L_3$ category ships are concerned, design sections where $x\leq 0.380$ should only be considered; for $b$, see Fig. 3.10.1.3). The value should be determined by the formulae below.

\[
v = 0.278 + \frac{0.18x}{L} \sqrt{\frac{L}{B}} \quad \text{for} \quad x \leq 0.25;
\]

\[
v = 0.334 - \frac{0.08x}{L} \sqrt{\frac{L}{B}} \quad \text{for} \quad x > 0.25;
\]

$x$—the distance between the considered section and the forward perpendicular, in m;

$\alpha$—angles of summer loadline inclination which are to be measured in accordance with Figs. 3.10.1.2-1 and 3.10.1.2-3 (where $x=0$), in deg.;

$\beta$—angles of frame inclination on summer loadline level which are to be measured in accordance with Fig. 3.10.1.2-2, in deg.; where the frame is concave in the design section, a minimal angle should be chosen for in the case of $L_4$, $L_5$, $L_6$, $L_7$, $L_8$, $L_9$ category ships which is measured on the level of contingent service waterlines.

If $\alpha > 0$ and $\beta > 0$ in the design section of $L_1$, $L_2$, $L_3$ category ships, it should be considered that $v = 0.72$ in this section.

If the angle of $\alpha$ is less than $3^\circ$ in the design section of $L_1$, $L_2$, $L_3$, $L_4$, $L_5$ category ships, such a section may be omitted when calculating $v_m$.

In any case, the ice pressure of $P_{ai}$ is not to be less than

\[
P_{ai} = \frac{2500a_2v_m^6}{\sqrt{1000}} \quad (3.10.3.2.1)
\]

where $a_2$—factor to be adopted from Table 3.10.3.2.1 proceeding from the ice category;

$v_m$ is to be determined by the method described in 3.10.3.2.1; for $\Delta$, see 3.10.3.2.1.

In any case, the ice pressure of $P_{ai}$ is not to be less than

\[
P_{ai} = \frac{p_{ai}}{b_i/\beta}, \quad (3.10.3.2.2)
\]

where $\beta_i$—factor to be adopted from 3.10.3.2.3.

For $\Delta$, see 3.10.3.2.1.

.4 In region $L_2$, $L_3$, $L_4$, $L_5$, $L_6$ category ships,

\[
P_{ci} = a_4\sqrt{\beta}, \quad (3.10.3.2.4-1)
\]

where $a_4$—factor to be adopted from Table 3.10.3.2.1 proceeding from the ice category;

For $\Delta$, see 3.10.3.2.3.

.5 In regions II, III and IV, the ice pressure is determined as a part of the ice pressure in region I at the appropriate section of the ship length:

\[
p_{ki} = a_{ki}p_{ai}, \quad (3.10.3.2.5)
\]

where $k = A, A_i, B, C$;

$l = II, III, IV$;

$a_{ki}$—factor to be adopted from Table 3.10.3.2.5.

---

$u_m$ — maximum value of the shape factor $u$ for the region, to be determined in sections within $x = 0; 0.05L; 0.1L$, etc., from forward perpendicular at summer loadline level within the fore run (as far as $LY1, LY2, LY3$ category ships are concerned, design sections where $x < 0.58b$ should only be considered; for $b$, see Fig. 3.10.1.3.2). The value should be determined by the formulae below.

\[
\begin{align*}
\frac{u}{k_\beta} &= \left(0.635 + 0.61x \frac{1}{\beta} \right) \frac{\sqrt{\beta}}{\beta} \quad \text{for } \frac{x}{L} \leq 0.25; \\
\frac{u}{k_\beta} &= \left(0.862 - 0.50x \frac{1}{\beta} \right) \frac{\sqrt{\beta}}{\beta} \quad \text{for } \frac{x}{L} > 0.25; \\
k_\beta &= \begin{cases} 1 & \text{where } \beta \geq 7^\circ \\ 1.15 - 0.15x & \text{where } \beta < 7^\circ \end{cases}
\end{align*}
\]

for $x$, $\beta$, see 3.10.3.2.1.

If $x > 0$ and $\beta = 0$ in the design section of $LY1, LY2, LY3$ category ships, it should be considered that $u = 0.92$ for this section.

If the angle of is less than $3^\circ$ in the design section of $LY1, LY2, LY3, LY4, LY5$ category ships, such a section may be omitted when calculating $u_m$.

#### 2 In regions A1I, A1II, A1III, A1IV

$b_{AI} = C_3k_Au_m$, but not greater than $1.25b_3p_{AI}/p_{AI}$, (3.10.3.3.2)

$C_3$ — factor to be adopted from Table 3.10.3.3.1 proceeding from the ice category;

$C_4$ — factor to be adopted from Table 3.10.3.3.1 proceeding from the minimal side inclination angle with regard to normal in the midship region of ice strengthening on summer loadline level;

$k_A$, see 3.10.3.3.1.

#### 3 Regions BI, BII, BIII, BIV

$b_B = C_3C_4k_A$, (3.10.3.3.3)

$C_3$ — factor to be adopted from Table 3.10.3.3.1 proceeding from the ice category;

$C_4$ — factor to be adopted from Table 3.10.3.3.3 proceeding from the minimal side inclination angle with regard to normal in the midship region of ice strengthening on summer loadline level;

$k_A$, see 3.10.3.3.1.

---

#### 3.10.3.4 Horizontal distribution of ice pressure, in $m$, should be determined by the following formulae.

##### 1 In regions AI, AII, AIII, AIV

\[
l_p^A = 11.3 \sqrt{b_A \sin \beta_A^m}, \quad \text{but not less than } 3.5 \sqrt{k_A}, \quad (3.10.3.4.1)
\]

where for $b_A$, see 3.10.3.3.1;

$\beta_A^m$ — angle $\beta$ in the design section of region A for which the value of the $u$ parameter is maximum (see 3.10.3.3.1).

##### 2 Regions A1I, A1II, A1III, A1IV

\[
l_p^A = 11.3 \sqrt{b_A \sin \beta_A^m}, \quad \text{but not less than } 3.5 \sqrt{k_A}, \quad (3.10.3.4.2)
\]

where for $b_A$, see 3.10.3.3.2;

$\beta_A^m$ — angle $\beta$ in the design section of region A1 for which the value of the $u$ parameter is maximum (see 3.10.3.3.1); for $k_A$, see 3.10.3.3.1.

##### 3 In regions BI, BII, BIII, BIV

\[
l_p^B = 6b_B, \quad \text{but not less than } 3.5 \sqrt{k_A}, \quad (3.10.3.4.3)
\]

where for $b_B$, see 3.10.3.3.3; for $k_A$, see 3.10.3.3.1.

##### 4 In regions CI, CII, CIII, CIV

\[
l_p^C = 6b_C, \quad \text{but not less than } 3.5 \sqrt{k_A}, \quad (3.10.3.4.4)
\]

where for $b_C$, see 3.10.3.3.4; for $k_A$, see 3.10.3.3.1.

#### 3.10.3.5 For icebreakers, the ice pressure is to be determined by the formulas given below.

##### 1 In region AI

\[
p_{AI} = k_p \rho_{AI}, \quad (3.10.3.5.1)
\]

where $\rho_{AI}$ — ice pressure in region AI, to be determined in accordance with 3.10.3.2.1 as in the case of a ship whose ice category number coincides with the category number of the icebreaker;

\[
k_p = \begin{cases} 1 & \text{where } N_2 < N_0 \\ \left(\frac{N_2}{N_0}\right)^{0.4} & \text{where } N_2 > N_0 \end{cases}
\]

$N_2$ — propeller shaft output, in MW; $N_0$ is to be adopted from Table 3.10.3.5.1.

---

<td>0.7</td>
</tr>
</tbody>
</table>

Table 3.10.3.5.3

310.3.6 As far as icebreakers are concerned, the vertical distribution of ice pressure is to be adopted equal for all regions and should be determined in accordance with 3.10.3.5.1, i.e. as for the forward region of the ship whose ice category number coincides with the category number of the icebreaker. When determining \( u_{\text{op}} \), the values of \( u \) should be calculated for those sections only which are included in the forward region of ice strengthening of the icebreaker.

3.10.3.7 As far as icebreakers are concerned, the horizontal distribution of ice pressure is to be adopted equal for all regions and should be determined in accordance with 3.10.3.4.1, i.e. as for the forward region of the ship whose ice category number coincides with the category number of the icebreaker. When determining \( p_{\text{min}} \), only those sections should be considered which are included in the forward region of ice strengthening of the icebreaker.

3.10.4 scantlings of ice-strengthening structures.

3.10.4.1 Shell plating.

In regions of ice strengthening, the shell plating thickness \( s_{\text{op}} \), in mm, should not be less than given by the formula

\[ s_{\text{op}} = s_{\text{op}0} + \Delta s_{\text{op}0} \]  

(3.10.4.1)

where

\[ s_{\text{op}0} = 15.8d_0 \sqrt{\frac{F}{P_{\text{pp}}}} \];

\[ \Delta s_{\text{op}0} = 0.75Tu; \]

\[ d_0 = \frac{d}{1 + 0.5 \frac{b}{T}}; \]

\( p \) — ice pressure in the region under consideration according to 3.10.3.2 or 3.10.3.5, in kPa;

\( c = b \) where the grillage is transversely framed in the region under consideration. In this case, \( c \) is not to be greater than the spacing of intercostal stringers or the distance between plate structures;

\( c = b \) where the grillage is longitudinally framed in the region under consideration;

\( h \) — vertical distribution of ice pressure in the region under consideration according to 3.10.3.3 or 3.10.3.6, in m;

\( l \) — distance between adjacent transverse members, in m;

\( a \) — spacing of main direction girders, in m;

\( T \) — planned ship life, in years;

\( a \) — annual reduction of shell plating thickness as a result of corrosion wear and abrasion, in mm per year, to be adopted from Table 3.10.4.1. When taking measures to protect the shell plating from corrosion wear and abrasion (by applying special coats, clad steels, etc.), the magnitude of the value \( u \) is subject to the special consideration by the Register.

3.10.4.2 Procedure for determining the required and actual geometrical characteristics of girder structures.

.1 The dependences, as given in 3.10.4.3 — 3.10.4.8, for determining the required geometrical characteristics of girder structure cross sections, such as the ultimate section modulus \( W \) and the web area \( A \), are based on the ultimate strength criterion. The following recommendations should preferably be considered when determining the values of \( W \) and \( A \).

.2 The required value of the ultimate section modulus \( W \) is proportionate to the factor \( k \) which
varies on the basis of the dependence between the required web area \( A \) and the actual web area \( A \) (adopted when choosing the section).

\[
W = W_0 k; \quad k = k(\gamma) = A/A_a, \quad (3.10.4.2.2-1)
\]

where \( W_0 \) — required value of \( W \), web area margin disregarded, to be determined in accordance with 3.10.4.3.1, 3.10.4.4.1, 3.10.4.5.1, 3.10.4.6.1, 3.10.4.7.1.

In the absence of a web area margin \( (A = A_a, \quad \gamma = 1) \), the value of \( W \) is maximum \( (k = 1) \). The increase of the actual web area as compared with the required one \( (\gamma < 1) \) makes it possible to reduce the value of \( W \) (assuming \( \gamma = 0.9 \quad 0.8; \quad k = 0.7 \pm 0.63 \)).

Thus, the application of a flexible procedure for choosing the section is ensured which makes it possible to do without redundant margins of material, but provides for several approximations during the calculation. By way of the first approximation, the following assumptions should be made in dependences (3.10.4.3-1), (3.10.4.4-1), (3.10.4.5-1), (3.10.4.6-1), (3.10.4.7-1):

\[
\begin{align*}
\gamma &= 0.9, \text{ i.e. the actual girder web area should be at least by 10 per cent greater than the required one;} \\
k_f &= \frac{1}{F + 0.11f} \quad \text{for conventional frames;} \\
k_j &= 0.7 \quad \text{for other girder types,}
\end{align*}
\]

\[
(3.10.4.2.2-2)
\]

where \( i \) — girder type index (\( f \) for frame, \( s \) for stringer, \( w_f \) for web frame, \( l \) for longitudinal);

for \( F \), \( f \), see 3.10.4.3-1.

.3 For grillages comprising deep frames, provision is made for a procedure to take account of the redundant margins of material which emerge when choosing girder sections as a result of the actual section modulus \( W_a \) and the actual web area \( A_a \) exceeding the required values of \( W \) and \( A \). Redundant margins are accounted for by applying the factors

\[
\begin{align*}
\gamma_i &\leq 1; \quad \psi_f = \frac{W_{ai}}{W_{ai}} < k_f, \\
\gamma_j &\leq 1; \quad \psi_j = \frac{W_{aj}}{W_{aj}} < k_j,
\end{align*}
\]

\[
(3.10.4.2.3)
\]

where for \( k, \gamma, W_0 \), see 3.10.4.2.1-1;

for \( i, \) see 3.10.4.2.2-2.

If the actual geometrical characteristics of a conventional frame exceed the required ones \( (\gamma_i < 1, \quad \psi_f > k_f) \) in a transversely framed grillage, the required geometrical characteristics of the bearing stringer and deep frame (in the case of the latter, redundant margins, if any, of the bearing stringer \( (\gamma_i < 1, \quad \psi_j > k_j) \) are also considered) are lowered due to this. In a similar way, provision is made in the case of a longitudinally framed grillage for lowering the requirements for the deep frame where longitudinals have redundant margins \( (\gamma_j < 1, \quad \psi_j > k_j) \).

.4 Where the section choosing procedures in accordance with 3.10.4.2.2 and the procedures for considering the redundant margins of materials in accordance with 3.10.4.2.3 appear too complicated, a simplified calculation can be carried out, assuming

\[
\gamma_i = 0.9; \quad k_f = \frac{1}{F + 0.11f} \quad \text{for conventional frames;} \\
k_j = 0.7 \quad \text{for other types of girders;}
\]

\[
(3.10.4.2.4)
\]

Precise instructions concerning the simplified calculation procedure are to be found directly in 3.10.4.3 — 3.10.4.7.

It should be borne in mind that the simplified calculation would bring about an increase of girder structural dimensions. Therefore, the simplified calculation is not recommended for icebreakers and \( \textbf{LY}4 \), \( \textbf{LY}5 \), \( \textbf{LY}6 \), \( \textbf{LY}7 \), \( \textbf{LY}8 \), \( \textbf{LY}9 \) category ships.

.5 When choosing girder sections, the face plate and effective flange sections whose breadth is equal to the web thickness (Fig. 3.10.4.2.5) are to be included in the actual web area \( A_w \), in \( \text{cm}^2 \).

Fig. 3.10.4.2.5
If there are openings in girder webs, they may be ignored in the case of side stringers only provided the openings are not made in the vicinity of supporting sections. The requirements for the area of frame webs (both conventional and deep frames) are to be verified on the basis of net sections.

6 To determine the actual value of the ultimate section modulus of the girders of ice strengthening structures it is recommended to use the formula

\[ W_a = \frac{w_{sec} - 0.5w_a - C}{}, \] cm³, \hspace{1cm} (3.10.4.2.6-1)

where \( C = 0 \) with \( f_{cf} < f_{sec} \);

\[ C = \left( \frac{f_{sec} - f_{cf}}{4} \right) \text{ with } f_{cf} < f_{sec}, \]

\( f_{sec} \) — girder sectional area minus effective flange of shell plating, in cm²;

\( f_{cf} = 0.1(f - 0.05(t_1 + t_2)) \), cm²;

\( h \) — section height measured from the mid-thickness of effective flange to the mid-thickness of face plate (Eq. 3.10.4.2.5.1), cm;

\( s \) — section web thickness, in mm;

\( f_{cf} = 0.1h/t_{cf} \) — effective flange area of shell plating, in cm²;

\( t_{cf} \) — effective flange thickness, in mm, of shell plating, to be adopted equal to the average shell plating thickness in way of effective flange breadth;

\( t_{fp} \) — face plate thickness, in mm, \( t_{fp} = 1.5s \) to be adopted for bulb steel sections;

\( b_{cf} \) — effective flange breadth, in cm, to be adopted equal to:

- conventional frame spacing, for conventional and deep frames where transverse framing is used;
- longitudinals spacing, for longitudinals where longitudinal framing is used;
- 1/6 of deep frame span between decks or platforms, or of frame spacing, whichever is less, for deep frames where longitudinal framing is used;
- 1/6 of frame spacing, for stringers where web framing is used;
- half the sum of spacings of two adjacent girders of the same direction or 1/6 of girder span, whichever is less, in all other cases.

For rolled sections where \( f_{cf} < f_{sec} \), it may be assumed that

\[ W_a = f_{sec}(y_o + 0.05t_{cf}), \] cm³, \hspace{1cm} (3.10.4.2.6-2)

where \( y_o \) — distance between the gravity centre of the profile cross section, minus effective flange, and the shell plating, in cm (Fig. 3.10.4.2.5.2).

3.10.4.3 Conventional frames where transverse framing is used.

The requirements of this paragraph apply to conventional frames in grillages with transverse main framing and in grillages with deep frames where transverse framing is used.

In the case of grillages with transverse main framing, the requirements are to be applied to a single span of a conventional frame which lies between the supporting sections of the frame on the upper and lower supporting structures.

In the case of grillages with deep frames, the requirements are to be applied to all the spans of a conventional frame, i.e. between the supporting sections of the upper supporting structure and the upper side stringer, between side stringers \((m = 1)\) section where \( m \) is the number of side stringers), between the lower side stringer and the supporting section of the lower supporting structure.

6.1 The ultimate section modulus \( W_e \), in cm³, of a conventional frame is not to be less than given by the formula

\[ W_e = k_eW_{e0}, \] \hspace{1cm} (3.10.4.3.1)

where \( k_e = \frac{1}{2 + 0.15E_0} \), \( k_e = \frac{1}{2 + 0.11J} \) — for the case

of the simplified calculation in accordance with 3.10.4.2.4;

\( F = 1 \) with \( k = 4 \);

\( F = 0.5 \) with \( k < 4 \);

\( k \) — factor equal to:

as far as grillages with transverse main framing are concerned, see Table 3.10.4.3.1-1;

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>both ends have supporting sections</td>
</tr>
<tr>
<td>one end has a supporting section, the other is free (attached to an intercostal member)</td>
</tr>
<tr>
<td>both ends are free (attached to an intercostal member)</td>
</tr>
<tr>
<td>( k )</td>
</tr>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

\( l \) — Half the sum of distances between the supporting sections of two adjacent frames;

\( j \) — distance between the supporting sections of main frame.

\( k = 4 \) for grillages with deep frames;

\( j \) — factor equal to:

the number of fixed supporting sections of two adjacent frames \( j < 4 \) as far as grillages with transverse main framing are concerned, in the case of grillages with web framing, see Table 3.10.4.3.1-2;

\( j_e + 2 \) where \( j_e \leq 2 \) is the number of fixed supporting sections on the supporting structure for two adjacent frames.

\[ \gamma_e = \frac{A_f}{A_e}; \]

\[ A_f \] — see. 3.10.4.3.2;

\[ A_e \] — see. 3.10.4.3.3;

\[ W_{e0} = \frac{250}{R_{bl}} phalY E0\gamma_e \]
\[ p = \text{ice pressure in the region under consideration in accordance with 3.10.3.2 or 3.10.3.5, in kPa; where the lower boundary of region I is included in the grillage and the requirements of the Chapter cover region of ice strengthening I and II (see 3.10.1.3.4), the following values of } p \text{ should be adopted:} \]
\[ p = p_{\text{H}} \times \text{if the distance from the plating of the upper supporting structure of the grillage to the lower boundary of region I is greater than 1.2b, otherwise } p = p_{\text{AB}} \times \text{P} \times \text{B} \]

\[\text{for } W_{df} \text{ see 3.10.4.4.7;}
\]
\[k_{df} = \left(\frac{1}{\gamma_{df}}\right) \text{ with } l > 2 \psi_{1,1} ;
\]
\[k_{df} = \left(\frac{1}{k_{df}}\right) \text{ with } l < 2 \psi_{1,1} ;
\]
\[l_{df} \text{ see 3.10.3.4;}
\]
\[a_{df} \text{ see 3.10.4.4.1;}
\]
\[A_{df} \text{ see 3.10.4.5.2;}
\]
\[A_{df} \text{ see 3.10.4.5.3;}
\]
\[s_{df} = \text{actual thickness, in mm, of a deep frame web;}
\]
\[\Delta_{df} \text{ see 3.1.5.1.}
\]

.2 The web area $A_{df}$, in cm$^2$, of a deep frame is not to be less than given by the formula
\[
A_{df} = \frac{8.7pabk_{df}^2}{R_{ef}} \left(1 + mG\right) + 0.1h_{df}\Delta_s ,
\]  \quad (3.10.4.5.2)

where for $p, a, b$, see 3.10.4.3.1;

for $m$, see 3.10.4.4.1;

for $k_{df}$, $G$, see 3.10.4.5.1;

$h_{df}$ — deep frame web depth, in cm;

for $\Delta_s$, see 3.1.5.1.

.3 The actual web area $A_{df}$, in cm$^2$, of a deep frame is to be determined in accordance with 3.10.4.3.3.

.4 The web thickness $s_{df}$, in mm, is to be adopted not less than the greater one of the following values:
\[
s_{df} = k_s R_{ef} \left(\frac{pa + \Delta_s}{5.34 + 4\left(l_{df}/l\right)^2}\right) ,
\]  \quad (3.10.4.5.4-1)
\[
s_{df} = 0.63c_1 \sqrt{\frac{R_{ef}}{5.34 + 4\left(l_{df}/l\right)^2}} + \Delta_s ,
\]  \quad (3.10.4.5.4-2)

where $k_s = \frac{1}{1.25 \frac{W_{df}}{W_{df}^*} - 0.75}$, but not less than $k_s = 1.0$;

for $W_{df}$, see 3.10.4.5.1;

$W_{df}$ — actual ultimate section modulus, in cm$^3$, of a deep frame, to be determined in accordance with 3.10.4.2.6 (in the first approximation or for the purpose of the simplified calculation in accordance with 3.10.4.2.4, $W_{df} = W_{df}$ is to be adopted);

for $p, a, b$, see 3.10.4.3.1;

$c_1, c_2$ — the shorter and the longer side, in m, of panels into which the web of a deep frame is divided by its stiffeners;

for $\Delta_s$, see 3.1.5.1.

.5 The face plate thickness of a deep frame is not to be less than the thickness of its web.

.6 The face plate breadth $c_{df}$, in mm, of a deep frame is not to be less than the greater one of the following values:
\[
c_{df} = A_1 R_{ef} \left(\frac{W_{df}}{W_{df}^*}\right) \sqrt{\frac{h_{df} - A_2}{c_{df}}} ,
\]  \quad (3.10.4.5.6-1)
\[
c_{df} = A_2 l_{df} ,
\]  \quad (3.10.4.5.6-2)

where for $W_{df}$, see 3.10.4.5.1;

for $W_{df}^*$, see 3.10.4.5.4;

$l_{df}$ — face plate thickness, in mm, of a deep frame;

for $h_{df}$, see 3.10.4.5.1;

for $h_{df}$, see 3.10.4.5.2;

$A_1 = 0.0039; A_2 = 1.4; A_1 = 5$, if the deep frame web is provided with stiffeners fitted approximately normal to the shell plating;

$A_1 = 0.0182; A_2 = 2.6; A_1 = 10$, if the deep frame web is provided with stiffeners fitted approximately normal to the shell plating or if it is unstiffened.

Deep frame design providing for no face plate (plate section) is not permitted.

#### 3.10.4.6 Side and bottom longitudinals as part of longitudinal framing.

.1 The ultimate section modulus $W_i$, in cm$^3$, of a longitudinal is not to be less than given by the formula
\[
W_{i} = \frac{125}{R_{ef}} \frac{p b_{1} k_i c_i}{\psi} \sqrt{c_i},
\]  \quad (3.10.4.6.1)

where $W_{i} = \frac{125}{R_{ef}} \frac{p b_{1} k_i c_i}{\psi} \sqrt{c_i}$.

$k_i = \frac{1}{1 + \sqrt{1 - l_i^2}}$, $k_i = 0.7$; for the purpose of simplified calculation in accordance with 3.10.4.2.4;

$c = 1$ — for bottom longitudinals and for side longitudinals where no panting frames are fitted;

$c = \frac{1}{1 + 0.25 \frac{h_{df}}{c_{df}}}$ for side longitudinals where panting frames are fitted;

$h_{df} = k_1 b_{df}$;

$h_{2} = b_{1}(1-0.25b_{2})$ with $\psi < 2$.
Part II. Hull

\[ b_2 = a \text{ with } b_2 \geq 2; \]
\[ e = \frac{b}{2} + 1; \]
\[ \beta = \frac{b_2}{a}; \]
\[ k_0 = 1 + \frac{0.3}{\beta}; \]
\[ \gamma = 1 + k \frac{e}{a} ; \]
\[ \gamma_0 = 1 + k \frac{e}{a} ; \gamma_0 = 1.15; \text{ may be adopted for the purpose of} \]
\[ \text{the simplified calculation in accordance with 3.10.4.2.4; for } p, \beta, \text{ see } 3.10.4.3.1; \]
\[ a \text{ --- spacing, in } m, \text{ of longitudinals;} \]
\[ l \text{ --- spacing, in } m, \text{ of deep frames or floors;} \]
\[ \gamma = \frac{A_t}{A_0} \]
\[ \text{for } A_t, \text{ see } 3.10.4.6.2; \]
\[ \text{for } A_0, \text{ see } 3.10.4.6.3; \]
\[ s_{\text{act}} \text{ --- actual web thickness, in } mm, \text{ of a longitudinal; for } A_t, \text{ see 1.1.5.1; for } k_e, \text{ see 3.10.4.3.1.} \]

.2 The web area \( A_t \), in \( cm^2 \), of a longitudinal is not to be less than given by the formula

\[ A_t = \frac{8.7}{R_{c/H}} pb_1lekk + 0.1h_jds, \tag{3.10.4.6.2} \]

where for \( p, \) see 3.10.4.3.1; for \( h_j, l, e, \) see 3.10.4.6.1;
\[ k_1 \text{ --- factor to be adopted as the greater of the following:} \]
\[ k_1 = \frac{1}{1 + 0.76 \frac{h_j}{7}}; \]
\[ k_1 = 0.8; \]
\[ \text{for } A_0, \text{ see 3.10.4.6.1;} \]
\[ h_j \text{ --- web height, in } cm, \text{ of a longitudinal; for } A_t, \text{ see 1.1.5.1.} \]

.3 The actual web area \( A_{\text{act}} \), in \( cm^2 \), of a longitudinal is to be determined in accordance with 3.10.4.3.3.

.4 The web area \( s_t \), in \( mm \), of a longitudinal should be adopted not less than the greater of the following values:

\[ s_t = \frac{k_1}{k_2} \frac{pb_1}{R_{c/H}} \frac{\Delta S}{s_t}, \tag{3.10.4.6.4-1} \]
\[ s_t = 0.013h_j\sqrt{R_{c/H}} + \Delta S, \tag{3.10.4.6.4-2} \]

where \( k_1 = 1.4 \frac{W_{\text{act}}}{b_2} \), but not less than \( k_1 = 1.0; \)
\[ \text{for } W, \text{ see 3.10.4.6.1;} \]
\[ W_{\text{act}} \text{ --- actual ultimate section modulus, in } cm^3, \text{ of a longitudinal, to be determined in accordance with 3.10.4.2.6 (in the first approximation or for the purpose of the simplified calculation in accordance with 3.10.4.2.4, } W_{\text{act}} = W_j \text{ should be adopted); for } p, \text{ see 3.10.4.3.1; for } b_2, \text{ see 3.10.4.6.1; for } h_j, \text{ see 3.10.4.6.2; for } A_t, \text{ see 1.1.5.1.} \]

.5 The face plate thickness \( c_t \), in \( mm \), of a longitudinal having a bulb-plate or T section is not to be less than the greater of one of the following values:

\[ c_t = 0.0145R_{c/H} \frac{W_j}{W_{\text{act}}} \sqrt{T_{b_2}} \left( \frac{h_j}{s_{\text{act}}} - 0.98 \right), \tag{3.10.4.6.5-1} \]
\[ c_t = 2.5l_j, \tag{3.10.4.6.5-2} \]

\[ c_t = 69.6s_{\text{act}} \sqrt{\frac{h_j}{l_j}} \left( \beta^2 - 0.0029 \right), \tag{3.10.4.6.5-3} \]

where \( \beta = \frac{(2 - 2h_j)}{2b_2} \), but not less than \( \beta = 0.055; \)
\[ \gamma = \sqrt{\frac{(2h_j)}{s_{\text{act}}}} \] \( \beta \leq 0.055; \)
\[ \text{for } W, \text{ see 3.10.4.6.1; for } W_{\text{act}}, \text{ see 3.10.4.6.4; for } s_{\text{act}}, \text{ see 3.10.4.6.5; for } s_{\text{act}}, \text{ see 3.10.4.6.6;} \]
\[ s_{\text{act}} \text{ --- actual web thickness, in } mm, \text{ of a longitudinal; } \]
\[ t_j \text{ --- face plate thickness, in } mm, \text{ of a longitudinal (for longitudinals having a bulb-plate section, } t_j = 1.5s_{\text{act}} \text{ should be adopted); for } h_j, \text{ see 3.10.4.6.2; for } \]
\[ s_{\text{act}} \text{ --- actual shell plating thickness, in } mm; \]
\[ l_j \text{ --- maximum spacing, in } m, \text{ of adjacent transverse members crossing the span of a longitudinal.} \]

As far as longitudinals made of standard sections are concerned, conformance with the requirements for the face plate breadth may not be verified in case of carrying out a simplified calculation in accordance with 3.10.4.2.4.

.6 Where a longitudinal is made of plate sections, the plate height \( h_j \), in \( cm \), and the spacing \( l_j \), in \( m \), are not to be greater than given by the formulas:

\[ h_j = \frac{8.98s_{\text{act}}}{[R_{c/H}W_{\text{act}}(1 + 75s_{\text{act}}/s_{\text{act}}^3)]^{1/2}}, \tag{3.10.4.6.6-1} \]
\[ l_j = \frac{0.0541s_{\text{act}}h_j}{2 - s_{\text{act}}}, \tag{3.10.4.6.6-2} \]

where \( s_{\text{act}} = \frac{s_{\text{act}}^2}{s_{\text{act}} + 0.02h_j s_{\text{act}}}, \) with \( 1 \leq s_{\text{act}} \leq 1.9; \)
\[ \text{for } l_j, s_{\text{act}}, s_{\text{act}}, W, W_{\text{act}}, a, \text{ see 3.10.4.6.5.} \]

3.10.4.7 Deep frames as part of longitudinal framing.

.1 The ultimate section modulus \( W, \text{ in } cm^3, \text{ of a deep frame is not to be less than given by the formula} \]

\[ W = W_{\text{act}}k_x, \tag{3.10.4.7.1} \]

where \( W_{\text{act}} = \frac{500}{R_{c/H}} pb_2k_x^2 (1 + k_x)(Q - k_x R) \theta_{a_n}; \)
\[ k_x = \frac{1}{1 + \sqrt{1 - 2N}}; \]
\[ Q = 2 - N; \]
\[ N = \sum 2\psi \theta \psi \theta; \psi = \frac{R}{\gamma}; \]
\[ N = \frac{R}{\gamma}; \]
\[ R = \theta_{a_n} \]

For the purpose of a simplified calculation in accordance with 3.10.4.2.4, \( k_x = 0.7; N = 1.0; R = 0.33 \) should be adopted;
\[ \beta = \frac{b_2}{b}; \]
\[ \text{for } p, b, \text{ see 3.10.4.3.1; for } a, b_2, e, \gamma, \text{ see 3.10.4.6.1; for } k_x^2, \theta_{a_n}, \text{ see 3.10.4.5.1; for } \]
\[ k_x \text{ --- factor to be adopted as the lesser of the following:} \]
\[ k_x = 0.5(\frac{Q}{R} - 1); \]
\[ k_x = 0.5(\frac{Q}{R} - 0.25(\theta + 1)); \]
3.10.4.9 Plate structures.

.1 The thickness of plate structures forming part of web framing of side grillages (deep frames, side stringers) is to be determined in accordance with 3.10.4.4.4, 3.10.4.5.4, 4.10.4.7.4.

.2 The plate structure thickness of decks and platforms, as well as of double bottom, bottom stringers and centre girder is not to be less than \( s_{p1} \), in mm, to be determined from the formula

\[
 s_{p1} = s_{p0} + \Delta s, \tag{3.10.4.9.2}
\]

where \( s_{p0} = s_{p01} \), if the plate structure is provided with stiffeners fitted approximately normal to the shell plating;

\[
s_{p0} = s_{p02}, \quad \text{if the plate structure is not provided with stiffeners fitted approximately normal to the shell plating (permitted for \( \text{LV1, LV2, LV3 category ships);} \}
\]

\[
s_{p01} = \frac{b}{k_{s01}} \left( \frac{R_{H}}{h_{sf}} \right) \frac{0.0045b}{\sqrt{1 + 4 \left( \frac{h_{sf}}{b} \right)^{2} \left( \frac{h_{f}}{R_{H}} \right)^{3}}} ;
\]

\[
s_{p02} = \frac{0.95b_{h}}{R_{H}} ;
\]

for \( k_{s} \), see Table 3.10.4.9.2;

\[
\begin{array}{|c|c|}
\hline
\text{Ice category} & k_{1} \\
\hline
\text{LV1, LV2, LV3, LV4, LV5} & 1.3 \\
\text{LV6, LV6} & 1.2 \\
\text{LV7, LV7} & 1.1 \\
\text{LV8, LV8, LV9, LV9} & 1.0 \\
\hline
\end{array}
\]

\[
k_{2} = k_{s} \frac{k_{s}}{k_{f}} ;
\]

\[
k_{f} = 0.17d^{0.8} , \quad \text{but not less than 1.0;}
\]

\[
k_{f} = \frac{L_{w}}{L_{f}} ;
\]

\[
k_{p} = 1 \quad \text{for ice ships};
\]

\[
\text{for } d, \text{ see 3.10.3.2.2;}
\]

\[
\text{for } h, \text{ see 3.10.4.3.1;}
\]

\[
c_{sp} = \text{spacing, in m, of stiffeners in a plate structure or distance, in m, between other framing members fitted approximately normal to the shell plating;}
\]

\[
\text{for } s_{p0}, \text{ see 3.10.4.1;}
\]

\[
\text{for } \Delta s, \text{ see 1.1.5.1.}
\]

.3 In addition to the requirements of 3.10.4.9.2, the thickness of plate structures in decks and platforms, where the side is transversely framed, should not be less than \( s_{p2} \), in mm, to be determined from the formula

\[
 s_{p2} = s_{p0} + \Delta s, \tag{3.10.4.9.3}
\]

where \( s_{p0} = \frac{0.065}{2} \frac{b_{h}}{R_{H}} \left( 1 - \frac{b}{h} \right) - 0.5 \frac{W_{f} d^{10^{-7}} (h_{f})^{3.5}}{c_{sp} h_{f} l_{2}} - \frac{0.5 L_{w}}{a_{1}} \]

for \( p_{11} \), see 3.10.4.9.2.

\[
l = \frac{1}{2} (l_{1} + l_{2}) ;
\]

\[
x = 1 - \frac{a_{2}}{a_{1}} ;
\]

\[ l_{1}, l_{2} \quad \text{— distance, in m, from the plate structure under consideration to the nearest plate structures (decks, platforms, side stringers, inner bottom plating) on both sides;}
\]

\[ a_{1}, a_{2} \quad \text{— spacing, in m, of plate structure stiffeners fitted approximately normal to shell plating and welded thereto;}
\]
\( f_s \) — cross-sectional area of stiffener, in \( \text{cm}^2 \), without effective flange; where stiffeners are fitted parallel to the shell plating or snipped. \( f_s \) = 0 should be adopted;
for \( h, a, \alpha_0 \), see 3.10.4.3.1;
for \( W_{eq} \), see 3.10.4.3.4;
for \( h_0 \), see 3.10.4.3.2;
\( a_s \) — length, in m, of unstiffened section of opening in plate structure for the passage of a conventional frame, as measured on the shell plating;
for \( A_s \), see 1.1.5.1.

4 The plate structure thickness in transverse bulkheads where the side is transversely framed and the floor and bilge bracket thickness where the bottom is longitudinally framed are not to be less than \( s_{p33} \) in mm, to be determined from the formula

\[
s_{p33} = s_{p00} + A_s, \quad (3.10.4.9.4)
\]

where
\[
s_{p00} = a \left[ 1.8 \frac{p_2}{R_{EI}} - 0.009 \left[ 1 + \left( \frac{a}{k_3} \right)^2 \left( \frac{s_{p00}}{10a} \right)^{5/3} \right] \right],
\]
\[
p_2 = \frac{f_s}{k_3}, \quad k_s = 0.4a, \quad k_s = 0.4a, \quad \text{for } k_2, \alpha_0, \text{see 3.10.4.9.2};
\]
\( a \) — spacing, in m, of side (bottom) longitudinals;
for \( h \), see 3.10.4.3.1;
for \( A_s \), see 3.10.4.1;
for \( A_s \), see 1.1.5.1.

5 The plate structure thickness of transverse bulkheads in a transversely framed side, and of floors in a transversely framed bottom is not to be less than \( s_{p44} \) in mm, to be determined from the formula

\[
s_{p44} = s_{p00} + A_s, \quad (3.10.4.9.5)
\]

where
\[
s_{p00} = a \left[ 1.8 \frac{p_2}{R_{EI}} - 0.009 \left[ 1 + \left( \frac{a}{k_3} \right)^2 \left( \frac{s_{p00}}{10a} \right)^{5/3} \right] \right],
\]
\[
p_2 = \frac{f_s}{k_3}, \quad k_s = 0.4a, \quad k_s = 0.4a, \quad \text{for } k_2, \alpha_0, \text{see 3.10.4.9.2};
\]
\( a \) — spacing, in m, of conventional frames (for plate structures of bulkheads) or floors (for plate structures of floors);
for \( A_s \), see 3.10.4.1;
for \( A_s \), see 1.1.5.1.

6 In any case, the plate structure thickness of decks and platforms, transverse bulkheads, inner bottom, floors and bilge brackets, bottom stringers and centre girder is not to be less than \( s_{p55} \) in mm, to be determined from the formula

\[
s_{p55} = s_{p00} + A_s, \quad (3.10.4.9.6)
\]

where
\[
s_{p00} = 3 \sqrt{\frac{4q_1}{n}} \text{ with } q < q_1;
\]
\[
s_{p00} = 0.455 \left[ \frac{q_1}{R_{EI}} + \sqrt{\frac{q_1}{R_{EI}} + \frac{1.04 q_1}{n}} \right] \text{ with } q_1 < q < q_2;
\]
\[
s_{p00} = 1.73 \sqrt{\frac{4q_1}{n}} \text{ with } q \geq q_2;
\]
\[
q = 0.69p_2h \left( \frac{1}{1+0.16a} \right) \quad \text{for plate structures of decks and platforms, inner bottom, bottom stringers and centre girder in a longitudinally framed side or bottom;}
\]
\[
q = 0.89p_2a \quad \text{for other types of plate structures mentioned in 3.10.4.9.2 — 3.10.4.9.5;}
\]
for \( p_2, k_2, \alpha_0 \), see 3.10.4.9.2;
for \( p_2 \), see 3.10.4.9.4;

\[
q_1 = 0.353 \sqrt{\frac{R_{EI}}{n}} ;
\]
\[
q_2 = 4.9q_1 ;
\]
\[
u = \frac{0.294n_1}{c_1} ;
\]
\[
n_1 = \left[ 1 + \left( \frac{a}{c_1} \right)^2 \right] \quad \text{— the longer side of plate structure panel adjoins the shell plating;}
\]
\[
n_1 = 4 \quad \text{where the shorter side of plate structure panel adjoins the shell plating;}
\]
\( c_1, c_2 \) — the shorter and longer sides, in m, of panels into which a plate structure is divided by its stiffeners;
for \( h \), see 3.10.4.3.1;
\( a \) — spacing, in m, of main framing girders of shell plating; for \( A_s \), see 1.1.5.1.

.7 The inertia moment \( i \), in \( \text{cm}^4 \), of stiffeners by which the plate structures are strengthened and which are fitted approximately normal to the shell plating is not to be less than determined from the formula

\[
i = 0.01 R_{EI} i^2 \left( \frac{10s_{p44} + f_s}{p} \right), \quad (3.10.4.9.7)
\]

where \( l \) — span length, in m, of stiffener, not greater than \( l = 2a; \)
\( s_{p44} \) — thickness, in mm, of plate structure being strengthened;
\( a \) — spacing, in m, of stiffeners;
\( f_s \) — sectional area of stiffener, in \( \text{cm}^2 \), without effective flange.

.8 A horizontal grillage adjoining the shell plating in an region of ice strengthening, but not reaching from side to side (deck or platform in way of large openings, horizontal diaphragm of double side, etc.) may be considered a platform if the sectional area of its plating (on one side) is not less than \( F \), in \( \text{cm}^2 \), to be determined from the formula

\[
F = \frac{6p_b l^2}{R_{EI}} \left( 1 - \frac{b}{47l} \right), \quad (3.10.4.9.8)
\]

where for \( p_b \), see 3.10.3.2;
for \( h \), see 3.10.3.3;
\( l^2 \) — design distribution length, in m, for the load taken up by the transverse main framing of side, to be adopted equal to \( l^0 \), or to \( l^0 \) or \( 2a \), whichever is less, in the case of framing (transverse or longitudinal) including deep frames;
for \( l^0 \), see 3.10.3.4;
for \( a_0 \), see 3.10.4.4.1;
for \( l \), see 3.10.4.9.3.

Otherwise, such a structure should be considered a bearing side stringer.

A structure considered to be a platform is to comply with the requirements of 3.10.4.9 for the plate structures of platforms, and one considered to be a stringer, with the requirements of 3.10.4.4.

3.10.4.10 Stems and sternframes.

.1 The requirements of this paragraph for the area, section modulus and plate thickness of stem are to be complied with on the stem section from the keel to a level extending above the upper boundary of the ice strake by a value of \( H_1 \) (see Table 3.10.4.10.1). In the case of icebreakers, this stem section is to extend as far as the nearest deck or platform lying higher than this level. Outside the borders of the area considered, the stem scantlings may gradually reduce and the cross-sectional area of the bar is not to be less
than required in 2.10.4 while the plate thickness of a combined or plate stem is not to be less than $k_s$ (where $s$ is the shell plating thickness in way of ice strake in region AI, for $k_s$ see Table 3.10.4.10.1).

The cross-sectional area $S$, in cm$^2$, of stem irrespective of design is not to be less than determined from the formula

$$S = k_{s} f(A), \quad \text{(3.10.4.10.1-1)}$$

where $k_{s}$ — factor whose values are to be found in Table 3.10.4.10.1;

$$f(A) = \begin{cases} 0.0314 A + 137 & \text{with } A < 5000 \text{ t;} \\ A^{0.3} & \text{with } A \geq 5000 \text{ t;} \\ \end{cases}$$

$A$ — displacement, in t.

The section modulus $W$, in cm$^3$, of the stem cross-sectional area with regard to an axis perpendicular to the centreline is not to be less than given by the formula

$$W = 1.16 pb, \quad \text{(3.10.4.10.1-2)}$$

where $p$, $b$, see 3.10.4.3.1 as far as region of ice strengthening AI is concerned.

To be included in the design cross-sectional area of a combined or plate stem are areas of shell plates and centreline girder or of longitudinal bulkhead on the centre plane on a breadth not exceeding ten times the thickness of relevant plates.

The plate thickness $s$, in mm, of combined and plate stems, as well as of the structure shown in Fig. 3.10.2.6, is not to be less than determined from the formula

$$s = 1.25 s_{sp} \frac{d_{sp}}{a_{sp}} \sqrt{\frac{R_{ut}}{R_{el}}}, \quad \text{(3.10.4.10.1-3)}$$

where $s_{sp}$ see 3.10.4.1 as far as the region of ice strengthening AI is concerned;

$d_{sp}$ — spacing, in m, of transverse brackets of stem;

$a_{sp}$ — main framing spacing, in m, in way of shell plating in the region of ice strengthening AI, which was adopted when determining $s_{sp}$;

$R_{ut}$ — tensile strength, in MPa, of shell plating material, which was adopted when determining $s_{sp}$;

$R_{el}$ — tensile strength, in MPa, of stem plate material.

For the sternframes of single-screw ships of categories $	ext{LY1}$, $	ext{LY2}$, $	ext{LY3}$ having no rudder post or fitted up with a rudder axle for Simplex rudders, the greatest value out of those stipulated by 2.10.4.2.5 (account being taken of 2.2.2.2, Part III "Equipment, Arrangements and Outfit") should be adopted for the scantlings of the solpiece cross section, or they should be determined from Formula (3.10.4.10.2), whichever is greater.

Where the sternframe has a horn for a semi-spade rudder, the scantlings of the rudder horn are to be determined according to 2.10.4.14 with due regard for the requirements of 2.2.2.2, Part III "Equipment, Arrangements and Outfit".

The sternframe sectional area of twin-screw ice ships or icebreakers is not to be less than the rudder post area stipulated in 3.10.4.10.2.

### 3.11 ICEBREAKERS

The Chapter has been annulled. The appropriate requirements are stipulated by Chapter 3.10.
3.12 ICE STRENGTHENING OF TUGS

3.12.1 General provisions and requirements.

3.12.1.1 Tugs provided with ice strengthening in compliance with the requirements stated below are provided with one of the following ice-category marks in their class notation: LY2, LY3, LY4, LY5.

The ultimate and permissible thickness of ice in which ice-strengthened tugs may operate is to be determined on the basis of 2.2.3.4 and 2.2.3.5, Part I "Classification" as in the case of ice transport ships of categories LY2, LY3, LY4, LY5.

3.12.1.2 The hull form of ice-strengthened tugs is to be in accordance with the requirements of 3.10.1.2 for the hull form of ice ships of the respective category.

3.12.1.3 Regions of ice strengthening.

3.12.1.3.1 For tugs, the boundaries of regions of ice strengthening are to be established in accordance with 3.10.1.3 as in the case of ice ships, unless specifically provided otherwise below.

3.12.1.3.2 In tugs with a small length of loadline fore run \((b + L_2 < 0.35L, \text{ see 3.10.1.3})\), the intermediate region of ice strengthening (or the forward region where no intermediate region is established) is to be extended aft so that the forward boundary of the midship region would be at least 0.35L away from the forward perpendicular.

3.12.1.3.3 The parameters \(h_1; h_2; L_2\) (see Fig. 3.10.1.3.2) are to be adopted from Table 3.12.1.3.3.

<table>

<td>0.10L</td>
<td>0.15L</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3.12.1.3.4 In tugs of LY2 and LY3 categories, an intermediate region of ice strengthening may also be established, and its boundaries are to be determined on the basis of the same regulations as for tugs of higher categories.

3.12.1.3.5 The regions of ice strengthening of tugs to which the requirements of this Chapter apply are to be determined proceeding from Table 3.10.1.3.4 as in the case of a transport ship of the respective ice category, with due regard for 3.12.1.3.4.

3.12.2 Construction.

3.12.2.1 The ice-strengthening construction of tugs is to comply with the requirements of para 3.10.2 for the construction of ice ships of respective categories.

3.12.2.2 The hull attachments of ice-protection components of the screw-rudder system are to ensure their reliable connection to main and web framing and, as far as practicable, to the sternframe and to longitudinal and transverse bulkheads so as to rule out the possibility of crack formation as a result of ice impacts on the stern.

3.12.3 Ice load.

3.12.3.1 The ice pressure is to be as given by the formulas below:

\[
p_{\text{AI}} = k_p \rho \Delta ,
\]

where \(\rho \Delta\) — ice pressure in region AI, as determined in accordance with 3.10.3.2.1 as in the case of a transport ship whose ice category number coincides with the ice category number of the tug;

\[
k_p = \begin{cases} 
1 & N_L \leq N_0; \\
(N_L/N_0)^{0.4} & N_L > N_0; 
\end{cases} 
\]

\(N_L\) — total shaft power of tug, in kW;

\(N_0 = C_N \Delta^{0.3}\);

\(C_N\) — factor to be adopted from Table 3.12.3.1.1;

\(\Delta\) — displacement to summer loadline, in t.

<table>
<thead>
<tr>
<th>Factor</th>
<th>Ice category of tug</th>
</tr>
</thead>
<tbody>
<tr>
<td>(C_N)</td>
<td>14</td>
</tr>
</tbody>
</table>

3.12.3.2 In regions A11, BI and CI

\[
p_{\text{BI}} = a_k \rho \Delta \]

where for pAI, see 3.12.3.1.1;

\(a_k\) — factor to be adopted from Table 3.12.3.1.2 proceeding from the region of ice strengthening and the ice category of tug:

\(k = \text{A1, B, C.}\)

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

3.12.3.3 In regions II, III and IV, an ice pressure is to be taken as required by 3.10.3.2.5 as in the case of transport ships with respective ice categories.

3.12.3.2 For tugs the vertical extension of ice load is to be adopted equal in all regions and should be determined in accordance with 3.10.3.3.1 as in the case of the forward region of a transport ship whose ice category number coincides with that of the tug. When determining \(u_{\text{up}}\), the values of \(u\) should be found for those sections only which are included in the forward region of ice strengthening of the tug.
3.12.3.3 For tugs the horizontal extension of ice load is to be adopted equal in all regions and should be determined in accordance with 3.10.3.4.1 as in the case of the forward region of a transport ship whose ice category number coincides with that of the tug. When determining $p_{a}$, only those sections should be considered which are included in the forward region of ice strengthening of the tug.

3.12.4 Scantlings of ice-strengthening structures.

.1 The scantlings of ice-strengthening structures in tugs should be determined in accordance with 3.10.4 as in the case of transport ships of the corresponding category, unless expressly provided otherwise below.

.2 When establishing the shell plating thickness in regions of ice strengthening in accordance with 3.10.4.1, the wear allowance $\Delta S_{HO}$ may be reduced on agreement with the Register, if special measures are taken to protect the shell plating from corrosion wear and abrasion, but in any case, $\Delta S_{HO}$ should be adopted not less than 2 mm.

.3 In addition to the requirements of 3.10.4.10, the stem and sternframe are to have a sectional area not less than given by the formula

$$S = kS_0,$$

(3.12.4.3)

where $k$ — factor whose values are to be found in Table 3.12.4.3; $S_0$ — area of the tug stem or sternframe without ice strengthening, to be determined in accordance with 3.9.4.5 or 3.9.4.6.

Table 3.12.4.3

3.13 FLOATING DOCKS

3.13.1 General.

3.13.1.1 Application.

The requirements of this Chapter apply to hull structures of wing-walled (caisson, pontoon, sectional) docks.

Caisson dock is a structure fitted with a solid pontoon and two wings continuous along the entire length and structurally inseparable (including caisson docks with end pontoons for docking a centre pontoon).

Pontoon dock is a structure fitted with two wings continuous along the entire length and several pontoons connected to the wings by bolts, rivets, welding.

Sectional dock is a structure consisting of several sections, each section being a caisson or a pontoon dock, connected by bolts, welded plates, hinges.

The requirements apply to the docks having a ratio of the length over the pontoon deck to the breadth more than 3,5.

Other structural configurations of docks and their proportions require individual consideration.

3.13.1.2 Definitions.

Length of dock at the pontoon deck $L_{p,d}$ is the distance measured along the pontoon deck parallel to the base line between moulded surfaces of the pontoon end bulkheads.

Breadth of the dock $B$ is the distance measured normal to the centre line between the moulded surfaces of the outer wall sides.

Depth of the dock $D$ is the vertical distance measured at the midship section from the base line to the moulded surface of the top deck at the outer wall side.

Design water line is a waterline of a floating dock corresponding to its draught with full stores, a ship of a design weight and a required quantity of ballast.

Design draught $d$ is a vertical distance measured from the base line to the design waterline.

Light draught $d_l$ is a vertical distance measured at the midship section from the base line to the waterline corresponding to the dock displacement with no stores, docked ship and ballast.

Maximum submersion depth $d_{m,s}$ is a vertical distance measured at the midship section from the base line to the waterline to which the dock may theoretically be lowered.

Lifting capacity of the dock $A$, in tons, is mass of the heaviest ship or ships that the dock shall lift in normal service.

Ship weight for docking $A_s$, in tons, is weight of the light ship to be docked with necessary stores and ballast to provide the ship’s draught and trim as required for docking.

Ballast water is sea water pumped into ballast compartments in order to change dock’s draught and trim.

Rest water ballast is ballast water which pumps cannot discharge.

Compensating ballast water is ballast water pumped into ballast tanks in order to reduce transverse and/or longitudinal bending moments and deflections of pontoon and/or wing wall structures.

Dock wing wall is a part of floating dock hull structurally connected to a pontoon or pontoons and intended to provide stability when the dock is lowered and lifted; a wing wall is divided by decks, platforms, bulkheads into spaces and compartments for arranging dock equipment and ballast.

Wall breadth at top deck $b_{w,d}$ is a distance measured normal to the centre line between
the moulded surfaces of the inner and outer wall sides at the level of the moulded surface of the top deck.

**Wall breadth at pontoon deck** \( b_{p,d} \) is the distance measured normal to the centre line between the moulded surfaces of the inner and outer wall sides at the level of the moulded surface of the pontoon deck.

**Pontoon deck** is the deck on which keel blocks or bilge blocks are fitted.

**Pontoon deck breadth** \( B_{p,d} \) is the distance measured normal to the centre line between the lines of intersection of moulded surfaces of the inner wall sides and the pontoon deck.

**Safety deck** is the watertight deck in wing walls of the dock, forming a boundary of the ballast compartments from above.

**Top deck** is the uppermost deck of dock wing walls.

**Pontoon** is a part of the dock hull intended to maintain buoyancy of the dock which is defined by volumes of its compartments.

**Pontoon depth** \( D_p \) is the distance measured at the centre line from the base line to the moulded surface of the pontoon deck.

**Ballast compartment** is a compartment in a pontoon or wing wall of the dock, bounded by watertight structures and intended for pumping ballast water.

**Dry compartment** is a compartment below the safety deck (or below the margin line where safety deck is omitted) not intended for pumping ballast water.

**Air cushion** is an area of a higher air pressure between the top of compartment and a level of ballast water therein.

**Crinolines** are cantilever structures of the dock, fitted at the end bulkheads of the dock pontoon at the pontoon deck level, aiming to increase an area available for docking operations at the ship’s ends projecting beyond the pontoon deck.

**Length of keel blocks track** \( L_s \) is the distance measured at the centre line parallel to the base line between outer ends of keel blocks.

### 3.13.1.3 Materials:

1. When selecting steel for hull structures of floating docks, provisions of 1.2 are to be applied, having regard to subdivision of structural members into groups according to Table 3.13.1.3.1.

2. Plate and beam items of crinolines, walkways and other secondary structures of a floating dock may be fabricated from steel having lower strength characteristics than specified in 1.2.2.1, provided their welding is guaranteed at the shipyard.

1. The effect of wear on the scantlings of structures is estimated on the basis of specification of strength to the end of the dock service life. Corrosion allowances are to permit operation of the dock during the full specified service life with average corrosion rates of structural items.

2. Scantlings and strength characteristics of structures with due regard for wear and corrosion are to be determined in compliance with 1.1.5, with a corrosion allowance \( \Delta s \), in mm, being obtained from the formula

\[
\Delta s = kuT
\]

(3.13.1.4.2)

where \( k \) = factor taking into account zone conditions of floating dock service and equal to: 1.0 for Baltic basin; 1.1 for Northern, Black-and-Azov and Caspian-and-Volga basins; 1.2 for Pacific basin; \( u \) = average annual reduction in thickness of structural members according to Table 3.13.1.4.2, in mm/year;

\( T \) = design service life of dock; where service life is not specified, it is to be taken as \( T = 50 \) years.

3. Average annual thickness reduction of dock structures plates and beams, given in Table 3.13.1.4.2, is to be used when dock structures have appropriate protective paint coatings.

\(^1\) In way of compartments heated in winter by live steam, \( u \) is to be increased by 10 per cent.
\(^2\) For bottom plating in way of ballast system suction and discharges \( u \) is to be increased by 15 per cent.

Specified corrosion rates may be reduced if special protective arrangements are made on agreement with the Register.

.4 Thickness of primary members (including corrosion allowance) are not to be less than given in Table 3.13.1.4.4 and determined depending on the assumed spacing \( a \).

3.13.1.5 Guidelines on design of floating dock structures.

When designing floating dock structures, the following sequence is recommended:

.1 Execution of structural layout of pontoon (pontoon) and wing walls (see 3.13.2).
.2 Determination of design loads resulting in local and longitudinal deflection of dock hull structures (see 3.13.3).
.3 Design of plate items and framing members of dock structures on the basis of local strength and buckling, having regard to minimum thickness restrictions.
.4 Design of structures which provide both transverse and longitudinal strength of dock pontoon. Values of structural parameters obtained in implementation of 3.13.1.5.3 are used here as initial data.
.5 Design of dock hull structures which provide dock longitudinal strength under design operating

</tbody>
</table>
conditions (docking operations). Values of structural parameters obtained in implementation of 3.13.1.5.3 and 3.13.1.5.4 are used here as initial data.

.6 Design of structures, having regard to the requirements for strengthening (e.g. wing wall decks and sides in way of openings, engine room, etc.).

.7 Check calculations of both longitudinal and transverse, as well as local strength of hull structures under conditions of real ship docking.

.8 Check calculations of both longitudinal and transverse, as well as local strength of dock structures during passage from a place of build to a place of operation. Development of recommendations on dock structure strengthening.

3.13.2 Construction.

3.13.2.1 Framing systems of pontoon (pontoons) and wing walls.

For pontoon (pontoons) of caisson, pontoon and sectional docks transverse framing is preferable.

Wing wall sides and decks of pontoon docks with lifting capacities of 10000 t and above are to be longitudinally framed; docks having lifting capacities below 10000 t may be framed transversely.

Wing wall sides and decks of caisson docks above the safety deck are to be longitudinally framed, wing wall sides below the safety deck may be transversely framed.

For pontoon bottom plating portions of caisson docks in way of wing walls a longitudinal framing may be adopted.

For transverse and longitudinal bulkheads of the pontoon and wing walls structures with horizontal and vertical stiffeners are permitted.

Truss arrangements may be used in the pontoon (pontoons) and wing walls.

3.13.2.2 Structural layout of pontoons.

Plate and beam structures of the pontoon are to maintain local strength of the appropriate pontoon structures (pontoon deck, bottom, longitudinal and transverse bulkheads, etc.), as well as transverse strength of the pontoon.

Spacing of primary longitudinal and transverse framing members of the pontoon is to be determined according to 1.1.3 with \( L = L_{p,t} \).

Primary transverse structures of the pontoon (pontoons), i.e. non-tight bulkheads, are to be fitted in 3 to 7 spacings, but they are not to be spaced more than \( (B - b_{p,t})/6 \) apart.

A centre line bulkhead is to be fitted under the keel blocks. A box structure formed by two longitudinal bulkheads arranged symmetrically on each side of the centre line may be used in lieu of the centre line bulkhead.

Bulkheads or girders are to be aligned with inner wall sides.

Where transverse framing is adopted for a pontoon (pontoons), additional primary longitudinal supporting members may be fitted to limit a span of transverse members of the bottom and pontoon deck. They are to be spaced not more than 3 — 5 spacings apart.

3.13.2.3 Structural layout of wing walls.

Spacing of primary longitudinal and transverse framing members of wing walls is to be determined as required by 1.1.3.

Where wall sides and decks are longitudinally framed, deck transverses and web frames are to be aligned with primary transverse structures of the pontoon (pontoons) (see 3.13.2.2).

Where wall sides are transversely framed, side stringers are to be fitted. Spacing of stringers and distance between stringers and deck are, in general, not to exceed 3.5 m.

Where transverse framing is adopted for wing walls below the safety deck it is advisable to provide web frames on wall sides in line with primary transverse structures of the pontoon, and deck transverses on the safety deck plating.

Primary supporting members of outer and inner wall sides below the safety deck (web frames with longitudinal framing and side stringers with transverse framing) are to be connected by cross ties which are to be fitted in line with each primary transverse of the pontoon (see 3.13.2.2).

3.13.2.4 Additional provisions.

Use of butt-lap connections for girders and transverses of pontoon (pontoons) and wing walls is permitted.

Where proper quality control of welding joints is provided, assembling joints aligned on plate structures and framing members are permitted.

Hollow square and tubular cross ties and struts are not to be used in ballast compartments and other tanks.

3.13.3 Design loads.

3.13.3.1 Loads for structure design based on local strength:

.1 Design pressure \( p \), in kPa, for plate and beam bottom structures is to be determined by the formulae:

\[
p = 10d_{m,b},
\]

in way of dry compartments

\[
p = 10(d_{m,b} - D_p),
\]

in way of ballast compartments not communicated with wing walls

\[
p = 10(d_{m,b} - z_{s,d} + \Delta z)
\]

and communicated with wing walls

where \( z_{s,d} \) = distance of the safety deck from the base line, in m;

\( \Delta z \) = thickness of air cushion, in m.
Design pressure \( p \), in kPa, for plate and beam structures of the pontoon deck in way of dry and ballast compartments is to be determined by Formula (3.13.3.1.1-2).

Design pressure \( p \), in kPa, for plate and beam structures of pontoon sides and end bulkheads is to be obtained using the following formulae:

\[
p = 10(d_{m,s} - z) \quad (3.13.3.1.3-1)
\]

where \( z \) = distance of the lower edge of the plate or mid-span of the framing member from the base line, in m;

in way of ballast compartments

\[
p = 10(d_0 - D_p) \quad (3.13.3.1.3-2)
\]

where \( d_0 \) = depth of the dock corresponding to filling of a side ballast compartment up to the safety deck, in m.

\( d_0 \) is not to be taken more than \( d_{m,c} \).

As the first approximation, where no special information is available, it may be assumed that

\[
d_0 = D_0 + G/2l_{p,d}^2 \rho_p.
\]

\( G \) = mass of dock without rest water and compensating ballast;

\( \rho \) = sea water density (see 1.1.3).

Design pressure \( p \), in kPa, for plate and beam structures of wall sides and end bulkheads are to be determined from the following formulae:

in way of dry compartments, using formula (3.13.3.1.3-1);

in way of ballast compartments

\[
p = 10(d_0 - z) \quad (3.13.3.1.4)
\]

where \( z \), \( d_0 \) = as defined above.

Design pressure \( p \), in kPa, for plate and beam structures of the safety deck in way of dry compartments is to be taken equal to 5 kPa; in way of ballast compartments \( p \) is to be determined by the formula

\[
p = 10(d_{m,6} - z_{s,d} + \Delta z) \quad (3.13.3.1.5)
\]

where \( z_{s,d} \), \( \Delta z \) = as defined in 3.13.3.1.1.

Design pressure \( p \), in kPa, for plate and beam structures of main watertight bulkheads of ballast compartments is to be determined by the formula

\[
p = 10(d_{m,s} - z_s + \Delta z) \quad (3.13.3.1.6)
\]

where \( z_s \) = distance of ballast compartment top from the base line, in m.

\( \Delta z \) = as defined in 3.13.3.1.1.

Design pressure \( p \), in kPa, for plate and beam structures of main watertight bulkheads is to be obtained from Formula (3.13.3.1.3-1).

Design pressure \( p \), in kPa, for plate and beam structures of the top deck is to be equal to 5 kPa.

Design pressure \( p \), in kPa, for plate and beam structures of oil fuel, lubricating oil, water and other tanks is derived from the following formulae:

when internal pressure is calculated:

\[
p = 10\rho(z_{s,p} - z) \quad (3.13.3.1.9)
\]

where \( \rho \) = density of liquid contained in the tank, in \( \text{t/m}^3 \);

\( z_{s,p} \) = distance of the upper edge of the air pipe from the base line, in m;

when external pressure is calculated, Formula (3.13.3.1.3-1) is to be used.

For plate structures arranged parallel to the base line, \( z \) is the distance of the plate structure from the base line.

Design pressure on crinoline structures is assumed to be equal to 5 kPa.

Design pressure on walkway structures is assumed to be equal to 3.5 kPa.

Design pressure on structures of safety deck, intermediate deck and platforms where equipment of the electric generating plant is arranged are assumed equal to 18 kPa; in way of accommodation and service spaces, 5 kPa.

Loads for structure design based on both transverse and longitudinal strength of pontoon (pontoons):

Design loads to be used in design of pontoon structures of caisson, pontoon and sectional docks are to be calculated for the condition when the ship of length \( L_c \) and weight equal to the maximum lifting capacity of the dock is supported on the keel blocks symmetrically about the midship section of the dock. The draught of the dock is to correspond to the design one (see 3.13.1.2); ballast water is considered evenly distributed over the length and breadth of the dock.

For pontoon and sectional docks an additional condition is to be considered for pontoons loaded by buoyancy forces the value of which corresponds to the condition specified in 3.13.3.2.1 corrected for rest-water counterpressure and gravitational forces of light-dock weight components, opposite in direction.

Where no initial data are available, buoyancy force \( p \), in kPa, may be obtained from the formula

\[
p = gA[B\ell_{p,d} - (n - 1)B_0] \quad (3.13.3.2.2)
\]

where \( n \) = number of pontoons of pontoon docks or sections of sectional docks;

\( B_0 \) = distance between pontoons or sections, in m.

Design length of the ship \( L_c \) is to be assumed equal to the length of the shortest ship whose docking weight is equal to the maximum lifting capacity of the dock, but not more than 0.9\( L_{p,d} \). For docks having lifting capacity more than 40,000 t, the design length of the ship is not to be taken less than 0.9\( L_{p,d} \).

The weight curve of the ship is to be taken as a rectangle with a superimposed parabola of half the area of the rectangle. Linear docking load \( q_c \), in kN/m,
at the section distant at \( x \) forward and aft from the midship section is to be determined by the formula

\[
q_x = \frac{gA}{L_x\phi} [1 - 3(1 - \phi)(2x/L_x)^2]
\]

where \( \phi \) = block coefficient of ship weight curve.

For docks of 40 000 t lifting capacity and less block coefficient of the ship weight curve is to be assumed depending on a design ship type according to Table 3.13.3.2.4.

<table>
<thead>
<tr>
<th>Type of ship</th>

<td>0.75 — 0.8</td>
</tr>
<tr>
<td>Ships with machinery space aft or semi-aft</td>
<td>1.0</td>
</tr>
</tbody>
</table>

Table 3.13.3.2.4

For docks above 40 000 t lifting capacity, \( \phi = 0.8 \) is to be assumed.

Where it is intended to lift ships simultaneously on keel and side blocks, as well as where different cases of simultaneous docking of several ships are expected, they are to be taken into account in design of structures which provide both longitudinal and transverse strength of the pontoon. Design loads are to be determined using the procedures approved by the Register.

Design loads on end pontoons of pontoon and sectional docks or on the end portions of caisson docks and when ships with overhung ends are docked are to be specially considered by the Register.

3.13.3.3 Loads for design of structures based on longitudinal strength:

1. Design loads are to be determined for the following conditions:

   - dock's sagging when a ship having the shortest length \( L_s \) expected and a weight equal to the maximum lifting capacity of the dock \( A \) is lifted;
   - dock's hogging when a ship having the largest length \( L_r \) expected and a weight equal to the maximum lifting capacity of the dock \( A \) is lifted, or two or more ships installed in line and having a total weight equal to \( A \) are docked.

Ballast water is considered to be evenly distributed over the entire length of the dock.

2. The form of ship weight curve is determined by relationship (3.13.3.2.4).

3. The design length of the shortest ship is to be as required by 3.13.3.2.3.

The design length of the largest ship or a total length of several ships installed in line over the length of the dock is not to be less than \( 1.3L_{p,d} \).

The design block coefficient of the ship weight curve is to be assigned according to 3.13.3.2.4; for hogging, \( \phi = 1.0 \) is to be taken, unless expressly provided otherwise.

3.13.4 Scantlings of structural members.

3.13.4.1 The thickness requirements for plate structures based on local strength.

The plating thicknesses of pontoon (pontoons), wall sides, interior and outer watertight bulkheads, decks and platforms are to be determined using Formula (1.6.4.4) with \( m = 22.4 \) and \( k_x = 1.8 \). A corrosion allowance is to be obtained according to the recommendations given in 3.13.1.4. The design transverse pressure \( p \) is specified in 3.13.3.1.

3.13.4.2 Scantling requirements for framing members based on local strength:

1. The section modulus of primary members is to be determined as required by 1.6.4.1.

2. The net sectional area of girders and transverses, as well as sectional area of beams and longitudinals having a relationship \( l/h \leq 10 \) (where \( l = \) design span, in m; \( h = \) web depth of a beam or longitudinal, in cm) are to be obtained from 1.6.4.3.

3. The design pressure \( p \) is to be determined at a mid-span of framing members as required by 3.13.3.1.

4. The design span \( l \) of framing members is to be selected in accordance with 1.6.3.1.

5. Coefficients of permissible normal and shear stresses specified in 1.6.4.1 and 1.6.4.3 are to be assumed equal to \( k_x = 0.8 \) and \( k_s = 0.8 \).

6. The factor \( \omega_x \) which takes account of framing member wear as given in 1.1.5.3 is to be taken with \( A_x \) according to 3.13.1.4.

7. Factors of design bending moments \( m \) and shear forces \( n \) are to be assumed as follows:

\[
m = 12 \quad \text{and} \quad n = 0.5 \text{ for bottom transverse and longitudinal members, beams and longitudinals of the pontoon deck; for stiffeners of watertight transverse bulkheads with longitudinally framed bottom and pontoon deck; for stiffeners of interior watertight longitudinal bulkheads with transversely framed bottom and pontoon deck; for longitudinal framing members of wall sides and decks; for safety deck beams with transversely framed wall sides below the safety deck; for girders and transverses of bottom and pontoon deck and side stringers of outer and inner wall sides;}
\]

\[
m = 8 \quad \text{and} \quad n = 0.5 \text{ for stiffeners of watertight transverse bulkheads with transversely framed bottom and pontoon deck; for stiffeners of interior longitudinal bulkheads with longitudinally framed bottom and pontoon deck; for horizontal stiffeners of watertight transverse bulkheads of wing walls with}
\]
transversely framed wall sides; for safety deck beams with longitudinally framed wall sides;

\[ m = 13 \quad \text{and} \quad n = 0.5 \] for wall deck and platform beams with transversely framed wall sides below the considered deck or platform; top deck or safety deck transverses;

\[ m = 11 \quad \text{and} \quad n = 0.6 \] for frames and web frames of the pontoon (pontoons), outer and inner wall sides.

.8 The scantlings and structures of girders and transverses of the pontoon and wing walls are to satisfy the requirements of 1.7.3.3. For girders and transverses of the wing walls above the safety deck the requirements for similar structures of dry cargo ships may be applied.

3.13.4.3 Requirements for cross ties, struts and braces:

.1 The sectional area of cross ties and struts \( S \), in \( \text{cm}^2 \), is not to be less than determined by a successive approximation method using Formula (2.9.4.1) with a design load \( P = 0.5(P_1 + P_2) \), in \( \text{kN} \), and factor \( k = 1.15 \) (where \( P_1 = p_{\text{dc}} \), \( P_2 = p_{\text{dc}} \) are maximum compressive forces acting at the ends of struts and cross ties; \( p_1 \) and \( p_2 \) are design pressures (see 3.13.3.1), in kPa; \( a = \) distance between members supported by struts or cross ties, in m; \( c \) is half-sum of span lengths on each side of the strut or cross tie under consideration, in m).

As a first approximation, \( S \) may be taken as:

\[ S = 0.11 P \]

and the radius of gyration \( i = \sqrt{IT/S} \), in cm, may be estimated for a suitable section having this area (where \( I = \) minimum central moment of inertia, \( \text{cm}^4 \)). If the area determined from Formula (2.9.4.1-1) using this radius of gyration differs by more than 10 per cent from the first approximation, a second approximation calculation is to be made. The radius of gyration is to correspond to the mean area of the first and second approximation.

.2 The web plates of cross ties and struts of channel or I sections are to be so selected that the ratio of the breadth to the thickness is not to exceed 42/\( i \) or 40, whichever is the greater (where \( i \) is length of a cross tie or strut, in m).

For ordinary angle or channel sections, the ratio of the breadth to the thickness of the flanges is not to exceed 14/\( i \) or 13, whichever is the greater.

For cross ties of fabricated sections or I sections cross ties, the ratio of the breadth to the thickness of face plates is not to exceed 28/\( i \) or 25, whichever is the greater.

The thickness of cross tie or stay items is not to be less than 7.5 mm.

.3 The scantlings of trusses are to be determined according to a procedure approved by the Register.

3.13.4.4 Additional local strength requirements for plates and beams.

If hull structures of the dock are subjected to the loads not covered by 3.13.3.1, the scantlings of plates and beams are to be determined using the procedures approved by the Register.

3.13.4.5 Scantling requirements for primary transverse and longitudinal members of pontoon (pontoons):

.1 The section modulus \( W \), in \( \text{cm}^3 \), of the primary transverse and longitudinal members of the pontoon (pontoons) is to be determined by the formula

\[ W = W_i + \Delta W \]

(3.13.4.5.1-1)

where \( W_i \) = specified section modulus of the end of the dock service life to be determined from the formula

\[ W_i = M_{100}^i/k_{\text{s}} \]

(3.13.4.5.1-2)

\[ M \] = design bending moment, in \( \text{kN} \cdot \text{m} \) (see also 3.13.4.5.6); \( \Delta W \) = corrosion allowance to the section modulus to be determined by the formula

\[ \Delta W = 100h (\Delta f_o + \frac{\Delta f_i}{\beta}) \]

(3.13.4.5.1-3)

\( h \) = web depth of members of the section under consideration, in m; \( \Delta f_o \), \( \Delta f_i \) = additions to the upper flange and web area of members, respectively, including corrosion allowances as based on the entire service life of the dock, in \( \text{cm}^2 \), derived from the formulas:

\[ \Delta f_o = 10.14a_{d_{\text{fl}}} + \Delta f_p; \]

\[ \Delta f_i = 10.14a_{d_{\text{fl}}} + \Delta f_p; \]

\[ A_{\text{fl}} - \text{reduction, in mm, of the plating thickness of the pontoon deck (member web) due to wear during service life of the dock (T years) with corrosion rate} \]

\[ u_{d_{\text{fl}}} \text{ in mm/year, according to Table 3.13.4.4.2;} \]

\( h_{f_i} \) = width of the effective flange (see 3.13.4.5.5), in m; \( \Delta f_p \) = addition to the flange area of the member allowing for corrosion wear of framing members, to be taken as:

for framing members of tee sections or flat

\[ \Delta f_p = 0.1mn(h_o + h_{f_i}) h_{f_i} T; \]

(3.13.4.5.1-4)

for framing members of bulb flat

\[ \Delta f_p = 0.86mn(h_o + h_{f_i} + f_o) h_{f_i} T; \]

(3.13.4.5.1-5)

When addition \( \Delta f_p \) is determined, results obtained in design of framing members based on local strength (see 3.13.4.2) are used. Where the sectional area of members does not include primary members, \( \Delta f_p = 0; \)

\( n \) = number of primary members over the breadth \( h_{f_o}; \)

\( h_o \) and \( h_{f_i} \) = face plate width and web depth of T-beam, respectively (for members of flat, \( h_{f_i} = 0 \), in cm; \( f_o \) = area of isolated section; \( t_o \) = web thickness of bulb flat; \( u_{d_{\text{fl}}} \) = specified corrosion rate for framing members of ballast compartments (see Table 3.13.1.4.2), in mm/year; \( \beta \) = factor dependent on web area \( f_{u_i} \) of the upper \( f_{u_i} \) and lower \( f_{u_i} \) face plates, having regard to wear to the end of the service life, to be determined by the formula

\[ \beta = (2f_{u_i} + f_{u_i}^2)/2f_{u_i} + f_{u_i} \]

(3.13.4.5.1-6)

as a first approximation, it may be assumed that \( \beta = 1.0. \)

.2 The sectional area of the web \( f_w \), in \( \text{cm}^2 \), of primary transverse members of the pontoon (pontoons) is to be obtained from the formula

\[ f_w = f_{w_0} + \Delta f_w \]

(3.13.4.5.2-1)
where $f_{w}^{*}$ = specified sectional area, in $cm^{2}$, of the web to the end of the service life of the dock, to be derived from the formula

$$f_{w}^{*} = 10N_{c}/k_{s}t_{w}$$  \((3.13.4.5.2-2)\)

$N_{c}$ = designed shear force (see 3.13.4.5.7), in kN; for $f_{w}^{*}$, see 3.13.4.5.1.

3.3 The scantlings of the truss (struts and braces) of the pontoon (pontoons) are to be adequate to take shear forces arising in longitudinal bending of the pontoon.

3.4 To be included in the design section of primary transverse members of the pontoon (pontoons) are all structural items which are continuous between the pontoon sides; design section of primary longitudinal members is to include all structural items which are continuous between the end bulkheads of the pontoon.

3.5 The width of the effective flanges of the primary transverse members $b_{c, f}$ in $m$, of the bottom and pontoon deck plating is to be taken as:

$$b_{c, f} = \min\{(B - b_{c, f})/6; c\}$$

where $c$ = average distance between the member under consideration and members on the right and on the left thereof, in $m$.

3.6 The design bending moments $M_{y}$ and $M_{x}$, in kN·m, acting in transverse and longitudinal members at the middle of a continuous pontoon of a caisson dock (Fig. 3.13.4.5.6-1) for the cases referred to in 3.13.3.2, are to be determined by the formulae:

$$M_{x} = q(B - b_{p, d})c_{x}\delta_{1}$$  \((3.13.4.5.6-1)\)

$$M_{y} = q(B - b_{p, d})c_{y}\delta_{2}$$  \((3.13.4.5.6-2)\)

where $q = q_{s}L_{w} = \text{average value of the linear load of the dock, in kN·m (}L_{w} = \text{as defined in 3.13.3.2);}$

$B$, $b_{p, d}$ = breadth of the dock and wing wall at the pontoon deck level;

$c_{x}$, $c_{y}$ = distance between primary transverse and longitudinal members of the pontoon, respectively, as shown in Fig. 3.13.4.5.6-1, in $m$;

$\delta_{1}$, $\delta_{2}$ = factors to be obtained from the diagrams given in Fig. 3.13.4.5.6-2 and 3.13.4.5.6-3 as dependent on parameters $L_{w}/L_{p, d}$, $n = L_{p, d}/(B - b_{p, d})$ and $\varphi$. 

---

**Fig. 3.13.4.5.6-1**

**Fig. 3.13.4.5.6-2**

**Fig. 3.13.4.5.6-3**
For pontoon and sectional docks, the design bending moment in design of primary transverse members $M_\text{x}$, in kN·m, is to be equal to the greater of the two values:

$$M_\text{x} = 0.25q \frac{c_x}{\varphi} (B-b_{d,p})(1-0.5\varphi) \frac{L_x}{L_{p,d}} \frac{B-b_{p,d}}{B};$$

or

$$M_\text{x} = 0.125pc_y(B-b_{p,d})^2,$$

whichever is the greater

where $p$ = as defined in 3.13.3.2.2.

.7 The design shear force $N_\text{x}$, in kN, taken by a transverse member of the dock (primary transverse member, or struts and braces of the pontoon truss) is to be determined by the formula

$$N_\text{x} = 0.75 \frac{gA}{L_x} (1-1.33 \frac{L_x}{L_{p,d}} \frac{y}{c})$$

where $y$ = distance of the section under consideration from the centre line of the dock, in m;

c = distance between the members under consideration, in m.

In design of the primary transverse members or struts and braces of the pontoon trusses of pontoon and sectional docks, the design shear force $N_\text{x}$, in kN, is not to be taken less than:

$$N_\text{x} = pc_y$$

where $p$ = as defined in 3.13.3.2.2.

.8 The coefficients of permissible stresses in Formulae (3.13.4.5.1-2) and (3.13.4.5.2-2) in design of primary transverse members of the pontoon (pontoons) are to be taken as follows: $k_\sigma = 0.85$, $k_c = 0.8$.

Guidelines on the selection of permissible normal stresses in primary longitudinal members of the pontoon (pontoons) are given in 3.13.4.6.5.

.9 The web thickness of primary transverse members are to meet the buckling strength requirements under the action of shear and normal stresses arising in transverse bending of the pontoon (pontoons).

The plating thickness of the pontoon deck and bottom is to meet the requirements for buckling strength under the action of compressive stresses arising in transverse bending of the pontoon (pontoons).

.10 Buckling strength conditions are to comply with 1.6.5.2 and 1.6.5.3. Factor $k$ in Formula (1.6.5.2) is taken equal to 0.75.

When Euler’s stresses are determined according to the formulæ given in 1.6.5.5 it is to be taken that $s = s - \Delta s$, where $\Delta s$ is obtained in compliance with 3.13.1.4.

3.13.4.6 The scantling requirements for structures based on strength and buckling conditions in longitudinal bending:

1. The assumed scantlings of dock longitudinal structures (with regard to the provisions of 3.13.4.6.2) are to provide the required hull section modulus of the floating dock.

The hull section modulus $W$, in cm³, of a floating dock is not to be less than:

$$W = W'\omega_c$$

where $W'$ = specified section modulus to the end of the service life of the dock, in cm³, determined by the formula

$$W' = M'10^3/k_\sigma\sigma_c;$$

$M$ = maximum bending moment determined by Formula (3.13.4.6.3), in kN·m;

$\omega_c$ = factor which takes account of corrosion allowance to the section modulus for wear determined by the formula

$$\omega_c = (1-F^{-1}+\sum\Delta f_s) \cdot 1,$$

$F$ = sectional area of the floating dock hull, in cm², corresponding to the Rule section modulus $W';$

$\Delta f_s$ = addition to the sectional area of the $i$-th plate strake, which takes account of corrosion allowance to be determined by the formula

$$\Delta f_s = 10.0s_n b_i;$$

$s_n$ — thickness reduction of the $i$-th plate member due to wear during service life $T$ (years), with a corrosion rate $n_c$, in mm/year, taken according to Table 3.13.1.4.2, in mm;

$b_i$ = width of the $i$-th member, in m.

Additions to the sectional area of the floating dock hull which take account of corrosive wear of framing members are to be not less than those obtained from the following formulae:

for framing members of tee sections or flat

$$D_f = 0.1n_l (b_{w_0} + b_{h_0})t_{f_0},$$

where $n_l$ = number of framing members of the $i$-th group;

$b_{w_0}$ = face plate width and web depth of T-beam, respectively, in cm (for members of flat, $b_{w_0} = 0$);

for framing members of bulb flat

$$D_f = 0.86n_l b_{w_0} t_{f_0},$$

where $b_{w_0}$ = sectional area of bulb flat section proper, in cm²;

$u_{f_0}$ = corrosion rate of framing members of the $i$-th group, in mm/year;

$t_{f_0}$ = web thickness of bulb flat;

$\varphi_l$ = multiplier taking account of the effect of changing sectional area of the $i$-th member on the section modulus $W$, to be obtained from the formula

$$\varphi_l = \frac{c_i^2}{(1+F)D} + c_i^{2}z_0$$

where $I$ = hull inertia moment, in cm⁴·m², of the dock, corresponding to the specified section modulus $W$;

$z_0, c_i$ = distance of the point at the level of which section modulus is determined and centre of gravity of sectional area of the $i$-th member ($i$-th group of longitudinal members) from the neutral axis, the position of which corresponds to $W$ and $I$; in determination of $z_0$ and $c_i$ their sign is to be taken into account: positive downwards and negative upwards from the neutral axis.
.2 Wing wall and pontoon longitudinals continuous in the middle region of the dock are to be included in the design cross-section of a caisson-type floating dock.

To be included in the design section of a pontoon dock are wing wall longitudinals continuous in the middle region of the dock.

.3 The design bending moment $M$, in kN.m, is to be determined for the cases referred to in 3.13.3.3, using the formula

$$ M = -0.125gAL_{p,d} \left(1 - \frac{3\varphi - 1}{2\varphi} \frac{L_{p}}{L_{p,d}} \right), \quad (3.13.4.6.3) $$

Recommends on the choice of design values of $\varphi$ and $L_{p}$ are given in 3.13.3.3.2.

.4 The coefficient of permissible stresses due to longitudinal bending referred to in Formula (3.13.4.6.1-2) is to be taken as $k_{a} = 1.0$.

.5 For caisson-type decks the following condition is to be fulfilled:

$$ \sigma_{1} + \sigma_{2} \leq k_{a}\sigma_{a} $$

where $\sigma_{1}$ = stresses in primary longitudinal members of the pontoon due to longitudinal bending of the dock; $\sigma_{2}$ = stresses in primary longitudinal members of the pontoon due to longitudinal bending of the pontoon.

Stresses $\sigma_{1}$, in MPa, are to be determined by the formula

$$ \sigma_{1} = 10^{3}Mz/I' \quad (3.13.4.6.5-1) $$

where $M$ = as defined in 3.13.4.6.3; $z$ = distance of the point under consideration from the neutral axis of the deck, in m; $I'$ = inertia moment of the dock to the end of the service life, in cm$^4$.

Stresses $\sigma_{2}$, in MPa, are to be derived from the formula

$$ \sigma_{2} = 10^{3}Mz'/I' \quad (3.13.4.6.5-2) $$

where $M_{p}$ = as defined in 3.13.4.5.6; $z'$ = distance of the point under consideration from the neutral axis of the section of the primary longitudinal, in m; $I_{y}$ = inertia moment of primary longitudinal, determined with regard to the wear of the members to the end of the service life of the dock and provisions of 3.13.4.5.4, in cm$^4$.

.6 In design of the dock hull, the requirements for buckling strength under the action of longitudinal bending of plate structures, girders and longitudinals, such as wall sides and deck plating, shell plating, longitudinal bulkhead plating of the pontoon and pontoon deck plating of caisson-type docks, bottom shell of pontoon dock wings are to be met in the middle region within $0.4L_{p,d}$.

The scantlings of top deck beams where transverse framing is adopted, top deck transverses in case of longitudinal framing are to be adequate to provide buckling strength of deck structure portions between deck girders, deck girders and wall sides or between wall sides where deck girders are omitted.

.7 The design compressive stresses $\sigma_{c}$, in MPa, obtained in estimation of the buckling strength are to be not less than:

$$ \sigma_{c} = \frac{M}{I'} z' \cdot 10^{5} \quad (3.13.4.6.7-1) $$

where $M$ = design bending moment causing the compression of the $i$-th member under consideration (see 3.13.4.6.3), in kN.m; $I'$ = actual central inertia moment of the hull girder with regard to wear to the end of the service life, in cm$^4$.

As a first approximation, $I'$ value, in cm$^4$, may be determined by the formula

$$ I' = W_{d}(D_{b} - e) \cdot 10^{2} \quad (3.13.4.6.7-2) $$

$W_{d}$ = required section modulus of the hull girder at a level of the lower edge of the top deck plating determined according to the requirements of 3.13.4.6.1, in cm$^3$; $D_{b}$ = depth of wall (for pontoon docks), in m; $D$ = $D_{b}$ for caisson-type docks; $e$ = distance of the neutral axis from the base line for caisson-type docks; distance of the neutral axis from the abutment line of the pontoon deck to the inner wall sides for pontoon docks, in m.

As a first approximation, it may be assumed that $e = 0.32D_{b}$ for caisson-type docks; $e = 0.5D_{b}$ for pontoon docks.

$z'$ = distance of the member under consideration from the neutral axis, in m ($z'$ is measured from the edge most distant from the neutral axis for a plate structure; from the middle of the thickness of the effective flange for a beam member of the deck and bottom; from the middle of the thickness of the beam web for a beam of the wall side, side plating and longitudinal bulkhead of the pontoon).

.8 The buckling strength conditions are to comply with 1.6.5.2 and 1.6.5.3. Factor $k$ in Formula (1.6.5.2) is to be taken equal to 0.8 for the top deck plating and wall sides; for the bottom and side plating of the pontoon and pontoon deck plating of caisson-type docks, girders and longitudinals.

.9 Euler stresses for plate structures are to be determined according to 1.6.5.5, and for girders and longitudinals as required by 1.6.5.4 taking $s' = s - \Delta s$ where $\Delta s$ is obtained as given in 3.13.1.4.

.10 The inertia moment of beams of the transversely framed top deck is to meet the requirements of 2.6.4.3.

The inertia moment of top deck transverses is to be as required by 2.6.4.9.

.11 The assumed scantlings of wing wall structures are to provide buckling strength in simple bending of the wing wall in design cases of dock sagging. The procedure of supporting buckling strength in simple bending is to be agreed with the Register.

3.13.4.7 Deflection control system.

Deflection of the dock hull is to be controlled according to the procedure approved by the Register.

In docks over 80 m in length at least two meters of different types to monitor the deflection of the dock are to be provided.
The maximum deflection stated in the Working Instructions supplied to the Dockmaster is to be agreed with the Register. The deflections are not to exceed the values obtained from the formula

$$\sigma(T) = (0.6 + 0.003T) \sigma_n$$

where \( T \) = service life of the dock to the date of monitoring, years;

\( \sigma_n \) = as defined in 1.1.4.3.

### 3.13.4.8 Requirements for dock towing

.1 The minimum section modulus \( W_{\text{min}} \), in cm\(^3\), required to ensure the strength of the dock during towing is to be determined by the formula

$$W_{\text{min}} = \frac{M}{\sigma_{\text{perm}}} \cdot 10^3$$  \hspace{1cm} (3.13.4.8.1-1)

where \( M \) = design bending moment, in kN.m, obtained from the formula

$$M = 5.03k_{w}B_{d}I_{p,d}$$  \hspace{1cm} (3.13.4.8.1-2)

\( k_w \) = factor of wave bending moment determined by the formula

$$k_w = 7.93 \cdot 10^{-3} + 4.13 \cdot 10^{-5} (L_{p,d} B) - 0.125 (d_{m} / L_{p,d});$$  \hspace{1cm} (3.13.4.8.1-3)

\( d_{m} \) = dock draught amidships during voyage in tow, in m;

\( h_d \) = design wave height, in m, determined depending on the length of the dock:

$$h_d = 10.9 - \left( 300 - \frac{L_{p,d}}{100} \right) \text{ for } L_{p,d} < 300 \text{ m},$$  \hspace{1cm} (3.13.4.8.1-4)

$$h_d = 10.9 \text{ for } L_{p,d} \geq 300 \text{ m};$$

\( \sigma_{\text{perm}} \) = permissible normal stresses in longitudinal bending of the dock, in MPa, taken equal to:

150 for docks under 100 m in length;

150 + 0.75(L_{p,d} − 100) for docks between 100 and 200 m in length;

225 for docks over 200 m in length.

.2 The still water bending moment \( M \), in kN.m, in the midship section of the dock during the voyage in tow is to be reduced to the minimum possible level by suitable ballasting.

.3 Sea state considered permissible for voyage in tow is that corresponding to the height of wave of 3% probability of exceeding level, in m, determined by the formula

$$h_{3%} = h_{0} + m(\lambda_{1}^{2} / \lambda_{2}^{2} - 1)$$  \hspace{1cm} (3.13.4.8.3-1)

where \( h_{0} \) = rated wave height, in m, permissible for voyage of a floating dock, with a relationship \( L_{p,d} / B = 4.25 \), obtained from the formula:

$$h_{0} = 0.313 + 0.0438L_{p,d} \text{ for } L_{p,d} < 130 \text{ m};$$

$$h_{0} = 3.30 + 0.0233L_{p,d} \text{ for } 130 \leq L_{p,d} \leq 260 \text{ m};$$

$$h_{0} = 0.422 + 0.0026L_{p,d} \text{ for } L_{p,d} > 260 \text{ m}.$$

\( m \) = factor determined from the formula:

$$m = 0.483 + 0.0218L_{p,d} \text{ for } L_{p,d} < 130 \text{ m};$$

$$m = 2.42 + 0.00685L_{p,d} \text{ for } 130 \leq L_{p,d} \leq 260 \text{ m};$$

$$m = 0.356 + 0.0148L_{p,d} \text{ for } L_{p,d} > 260 \text{ m}.$$  \hspace{1cm} (3.13.4.8.3-2)

Factors \( \lambda_1 \) and \( \lambda_2 \) are derived from the formulae:

$$\lambda_1 = M / M^0;$$

$$\lambda_2 = 1.276 - 0.065(L_{p,d} B);$$  \hspace{1cm} (3.13.4.8.3-3)

\( M^0 \) = basic bending moment, in kN.m, determined by the formula

$$M^0 = 0.77 \cdot 10^{-2} L_{p,d}^{1.65} \eta$$  \hspace{1cm} (3.13.4.8.3-4)

for \( \eta \), see 1.1.4.3;

\( M \) = bending moment, in kN.m, corresponding to the actual section modulus of the floating dock hull, obtained from the formula

$$M = k_{a}\sigma_{n}W^{0.3}$$  \hspace{1cm} (3.13.4.8.3-5)

where \( W \) = actual minimum section modulus of the dock hull to the moment of voyage;

\( k_{a} \) = 0.8 — factor of permissible normal stresses;

\( \sigma_{n} \) = as defined in 1.1.4.3.

.4 Correspondence between permissible sea state during voyage and heights of waves of 3% probability of exceeding level is to be determined according to Table 3.13.4.8.4.

<table>

.5 A possibility of voyage of a dock in tow whose architecture and relationships of the dimensions differ from those referred to in 3.13.1.1 is to be supported using the procedure approved by the Register.

.6 Voyage of a dock in tow within the limits of one and the same sea is permitted when the environmental conditions (sea state) corresponding to the requirements of 3.13.4.8.3 — 3.13.4.8.5 are expected.
TIGHTNESS TEST OF SHIP’S HULL

APPENDIX

1 GENERAL

1.1 Definitions.
Shop primer is a thin coating applied after surface preparation and prior to fabrication as a protection against corrosion during fabrication.
Protective coating is a final coating protecting the structure from corrosion.
Structural testing is a hydrostatic test carried out to demonstrate the tightness, as well as the structural adequacy of the design. Where practical limitations prevail and hydrostatic testing is not feasible (for example when it is difficult, in practice, to apply the required head at the top of the tank), hydropneumatic testing may be carried out instead. When hydropneumatic testing is performed, its conditions should simulate, as far as practicable, the actual loading of the tank.
Hydropneumatic testing is a combination of hydrostatic and air testing, consisting in filling the tank with water up to its top and applying an additional air pressure. The value of the additional air pressure is at the discretion of the Register, but is to be at least as defined in 2.2.
Leak testing is an air or other medium test carried out to demonstrate the tightness of the structure.
Hose testing is carried out to demonstrate the tightness of structural items not subjected to hydrostatic or leak testing and of other components which contribute to the watertight and weathertight integrity of the hull.

1.2 Application.
The following requirements determine the testing conditions for:
tanks including independent tanks;
watertight or weathertight structures.
The purpose of these tests is to check the tightness and/or strength of structural elements at the time of the ship construction and on the occasion of major repairs.
The tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to completion so that any subsequent work could not impair the strength and tightness of the structure.
For general testing requirements, see para 3.

2 TESTING METHODS

2.1 Structural testing.
Structural testing may be carried out after the application of shop primer.

Structural testing may be carried out after the protective coating has been applied, provided that one of the two following conditions is satisfied:
all the welds are completed and carefully inspected visually to the satisfaction of the Surveyor prior to the application of the protective coating,
leak testing is carried out prior to the application of the protective coating.

In the absence of leak testing, protective coating should be applied after the structural testing of:
all erection welds, both manual and automatic,
all manual fillet weld connections on tank boundaries and manual penetration welds.

2.2 Leak testing.
Where leak testing is carried out, in accordance with the table, air pressure of 15 kPa is to be applied during the test.

Prior to inspection, it is recommended that the air pressure in the tank is raised to 20 kPa and kept at this level for about 1 hour to reach a stabilized state, with a minimum number of personnel in the vicinity of the tank, and then lowered to the test pressure.

After the pressure has reached a stabilized state at 20 kPa, the test may be conducted without lowering the pressure, provided the safety of the personnel involved in the test is guaranteed.

Welds are to be coated with an efficient indicating liquid.

A U-tube filled with water up to a height corresponding to the test pressure is to be fitted to avoid overpressure in the compartment tested and verify the test pressure. The U-tube should have a cross section larger than that of the pipe supplying air. In addition, the test pressure is also to be verified by means of one master pressure gauge.

Alternative means may be accepted which are considered to be equally reliable. Thus, two pressure gauges and a safety valve may be fitted in the compartment being tested. The connections for the pressure gauges and the safety valve should be positioned on manhole covers, blank flanges and at other locations convenient for maintenance. The pressure gauges are to have an accuracy rating of 1.5 to 2.5 and a range by one third greater than the test pressure. The scale factor of the pressure gauges should not exceed 2 kPa.

Leak testing is to be carried out, prior to the application of a protective coating, on all fillet weld connections on tank boundaries, penetrations and erection welds on tank boundaries excepting welds made by automatic processes. Selected locations of automatic erection welds and pre-erection manual or
automatic welds may be required to be similarly tested at the discretion of the Surveyor taking account of the quality control procedures operating in the shipyard. For other welds, leak testing may be carried out, after the protective coating has been applied, provided that these welds were carefully inspected visually.

Any other recognized method may be accepted on agreement with the Register.

2.3 Hose testing.

When hose testing is required to verify the tightness of the structures, as defined in the table, the minimum pressure in the hose, at least equal to 200 kPa, is to be applied at a maximum distance of 1.5 m. The nozzle diameter is not to be less than 12 mm.

2.4 Hydro pneumatic testing.

When hydro pneumatic testing is performed, the same safety precautions as for leak testing are to be adopted.

2.5 Other testing methods.

Other testing methods may be accepted, at the discretion of the Register, based upon equivalency considerations.

</table>

1. Leak or hydropneumatic testing may be accepted under the conditions specified in 2.2, provided that at least one compartment or tank of each type is structurally tested, to be selected in connection with the design approval. Structural testing of compartments or tanks need not be repeated for subsequent vessels of a series of identical newbuildings. This relaxation does not apply to cargo space boundaries in tankers and combination carriers and tanks for segregated cargoes or pollutants. If structural test reveals weakness or severe faults not detected by the leak test, all compartments or tanks are to be structurally tested.

2. Where applicable, the highest point of the tank is to be measured to the deck and excluding hatches. In holds for liquid cargo or ballast with large hatch covers, the highest point of the tank is to be taken at the top of the hatch.

3. Leak or hydropneumatic testing may be accepted under the conditions specified in 2.2 at the discretion of the Register.

4. Where hose test cannot be performed without damaging the equipment (machinery, cables, switchboards, insulation, etc.) already installed, it may be replaced, at the Register discretion, by a thorough visual inspection of all the crossings and welded joints; where necessary, dye penetrant test or ultrasonic leak test may be required.

**Note 1**

**Regulation 14, Chapter II-1 of SOLAS 74 Convention**

**Construction and initial testing of watertight bulkheads, etc. in passenger ships and cargo ships**

1. Each watertight subdivision bulkhead, whether transverse or longitudinal, shall be constructed in such a manner that it shall be capable of supporting, with a proper margin of resistance, the pressure due to the maximum head of water which it might have to sustain in the event of damage to the ship but at least the pressure due to a head of water up to the margin line. The construction of these bulkheads shall be to the satisfaction of the Administration.

2.1 Steps and recesses in bulkheads shall be watertight and as strong as the bulkhead at the place where each occurs.

2.2 Where frames or beams pass through a watertight deck or bulkhead, such deck or bulkhead shall be made structurally watertight without the use of wood or cement.

3. Testing main compartments by filling them with water is not compulsory. When testing by filling with water is not carried out, a hose test is compulsory; this test shall be carried out in the most advanced stage of the fitting out of the ship. In any case, a thorough inspection of the watertight bulkheads shall be carried out.

4. The forepeak, double bottoms (including duct keels) and inner skins shall be tested with water to a head corresponding to the requirements of paragraph 1.

5. Tanks which are intended to hold liquids, and which form part of the subdivision of the ship, shall be tested for tightness with water to a head up to the deepest subdivision load line or to a head corresponding to two-thirds of the depth from the top of keel to the margin line in way of the tanks, whichever is the greater; provided that in no case shall the test head be less than 0.9 m above the top of the tank.

6. The tests referred to in paragraphs 4 and 5 are for the purpose of ensuring that the subdivision structural arrangements are watertight and are not to be regarded as a test of the fitness of any compartment for the storage of oil fuel or for other special purposes for which a test of a superior character may be required depending on the height to which the liquid has access in the tank or its connections.

**Note 2**

**Regulation 18, Chapter II-1 of SOLAS 74 Convention**

**Construction and initial tests of watertight doors, sidescuttles, etc. in passenger ships and cargo ships**

1. In passenger ships:

.1 the design, materials and construction of all watertight doors, sidescuttles, gangway, cargo and coaling ports, valves, pipes, ash-shoots and rubbish-shoots referred to in these regulations shall be to the satisfaction of the Administration;

.2 the frames of vertical watertight doors shall have no groove at the bottom in which dirt might lodge and prevent the door closing properly.

2. In passenger ships and cargo ships each watertight door shall be tested by water pressure to a head up to the bulkhead deck or freeboard deck respectively. The test shall be made before the ship is put into service, either before or after the door is fitted.
PART III. EQUIPMENT, ARRANGEMENTS AND OUTFIT

1 GENERAL

1.1 APPLICATION

1.1.1 The present Part of the Rules applies to equipment, arrangements and outfit of sea-going ships navigating in a displacement condition. To hydrofoil boats, air cushion vehicles, hydrogliders and other similar ships, unless expressly provided otherwise below, the requirements of this Part are applicable to the extent that is practicable and reasonable, and the equipment, arrangements and outfit of these ships are subject to special consideration by the Register in each case.

1.1.2 Ship's equipment, arrangements and outfit designed for special purposes (such as special anchor arrangements of dredgers, a deep-sea anchor arrangement for special purpose ships and similar arrangements) are not subject to supervision of the Register.

1.1.3 The present Part of the Rules applies, as far as practicable and reasonable, to floating metallic wing-walled docks, unless expressly provided otherwise. These Rules do not specify conditions for mooring of floating docks in a particular place of operation and selection of types and characteristics of the equipment, arrangements and outfit (anchor, mooring, etc.) used for this purpose.

1.2 DEFINITIONS AND EXPLANATIONS

The definitions and explanations relating to the general terminology of the Rules are given in General Regulations for the Supervision and in Part I "Classification".

For the purpose of the present Part of the Rules the following definitions have been adopted:

1.2.1 Waterlines.

Damage waterlines are the waterlines of a damaged ship after flooding of corresponding separate compartments or their combinations as provided in Part V "Subdivision".

Summer load waterline is the waterline indicated by the upper edge of the line which passes through the centre of the ring of the load line mark for a ship in upright position.

Summer timber load waterline is the waterline indicated by the upper edge of the assigned summer timber load line.

Deepest load waterline is the waterline indicated by the upper edge of the assigned uppermost regional or seasonal load line, including fresh water load lines.

Deepest subdivision load waterline is the uppermost waterline at which the requirements of Part V "Subdivision" are still fulfilled.

Margin line at docking is the envelope of the waterlines corresponding to the maximum permitted trims of the floating docks and docklift ships when carrying out the docking operations.

1.2.2 Dimensions and draught of the ship.

Length of ship \( L \) is taken as 96 per cent of the total length on a waterline at 85 per cent of the least moulded depth or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that be greater.

Where the stem contour is concave above that waterline, the length of the ship shall be measured from the vertical projection to that waterline of the aftermost point of the stem contour (above that waterline).

In ships designed with a rake of keel the waterline on which this length is measured shall be parallel to the design waterline.

Length of floating dock \( L \) is the distance measured along the pontoon deck and parallel to the base line, between the inner sides of the pontoon end bulkheads.

Moulded draught \( d \) is the vertical distance measured amidships from the top of the plate keel or from the point where the inner surface of the shell (outer surface in a ship with a non-metal shell) abuts upon the bar keel, to the summer load waterline.

Moulded depth \( D \) is the vertical distance measured amidships from the top of the plate keel, or from the point where the inner surface of the shell abuts upon the bar keel, to the top of the freeboard deck beam at side.

In ships having rounded gunwales, the moulded depth shall be measured to the point of intersection of the moulded lines of the freeboard deck and side, the lines extending as though the gunwale were of angular design.

Where the freeboard deck is stepped in the longitudinal direction and the raised part of the deck extends over the point at which the moulded depth is to be determined, the moulded depth shall be measured to a line of reference extending from the lower part of the deck along a line parallel with the raised part.

Moulded breadth \( B \) is the maximum breadth measured amidships from outside of frame to outside of frame in a ship with a metal shell and to the outer surface of the hull in a ship with a shell of any other material.

1.2.3 Superstructures, deckhouses.

Superstructure is a decked structure on the freeboard deck, extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 4 per cent of the breadth \( B \).
The superstructure may be either complete, i.e. extending over the entire ship’s length $L$, or detached, i.e. extending only over a definite part of this length. Both complete and detached superstructures may be arranged either in a single or several tiers.

Deckhouse is a decked structure on the freeboard or superstructure deck which is set in from the sides of the ship for more than 4 per cent of the breadth $B$ and has doors, windows or other similar openings in the outer bulkheads. The deckhouses may be arranged in a single or several tiers.

Trunk is a decked structure on the freeboard deck which is set in from the sides of the ship for more than 4 per cent of the breadth $B$ and has no doors, windows or other similar openings in the outer bulkheads.

1.2.4 Tightness.

Tight under pressure head up to... is the term pertaining to closing appliances of openings, which means that under specified pressure the liquid will not penetrate through the openings inside the ship.

Weathertight is the term pertaining to closing appliances of openings in the above-water hull, which means that in any sea conditions water will not penetrate through the openings inside the ship. Such closing appliances shall withstand a hose test on condition that the outlet of the nozzle is at least 16 mm in diameter and the head in the hose provides for water jet ejected upwards of not less than 10 m in height, the hose test is to be carried out perpendicularly to the tested surface and the distance from the nozzle to the tested portion being not more than 3 m.

1.2.5 Decks.

Upper deck is the uppermost continuous deck extending for the full length of the ship.

The upper deck may be stepped.

Raised quarter deck is the after upper part of a stepped deck, the forward lower part of which is taken as a portion of the freeboard deck.

Freeboard deck is the deck from which the freeboard is measured.

In a ship having a discontinuous deck the lowest line of this deck and the continuation of that line parallel to upper part of the deck is taken as a freeboard deck.

Superstructure deck, deckhouse top or trunk deck is the deck forming the top of a superstructure, deckhouse or trunk, respectively.

Superstructure deck or deckhouse top of the first, second, etc. tiers is the deck forming the top of the superstructure or deckhouse of the first, second, etc. tiers, counting from the freeboard deck.

Bulkhead deck is the deck up to which the main transverse watertight subdivision bulkheads are carried.

The bulkhead deck may be discontinuous, i.e. with a step or steps formed both by main transverse watertight bulkheads reaching the keel and transverse watertight bulkheads not reaching the keel.

Lower decks are the decks below the upper deck.

Weather deck is the deck which is completely exposed to the weather from above and from at least two sides.

Pontoone deck of the dock is the deck on which the ship to be docked is fitted.

Top deck of the dock is the uppermost deck of the dock (the uppermost deck of the wing walls).

1.2.6 Perpendiculars and amidships.

Amidships is at the middle of the ship’s length $L$.

Forward and after perpendiculars are the vertical lines passing in the centre line at the fore and after ends of the ship’s length $L$, respectively.

1.2.7 Ships.

Type "A" ship is a ship designed to carry only liquid cargoes in bulk, and in which cargo tanks have only small access openings closed by gasketed covers tight under an appropriate inner pressure of liquid which is carried in the tanks. Furthermore, a type "A" ship is to have some other features, as defined in the Load Line Rules for Sea-Going Ships which permit this ship to be assigned a freeboard based on Tables 4.1.2, 6.4.2.2 or 6.4.3.2 of the above Rules.

Type "B" ship is a ship which does not comply with the requirements regarding type "A" ships and which is assigned a freeboard based on Table 4.1.3.2, 6.4.2.3 or 6.4.3.3 of the Load Line Rules for Sea-Going Ships.

A type "B" ship may not be classified as a type "A" ship even though, as a result of her features detailed in the Load Line Rules, a reduction in tabular freeboard is permitted up to the total difference between the values given in Tables 4.1.2.3, 6.4.2.2, 6.4.3.2 and those in Tables 4.1.3.2, 6.4.2.3, 6.4.3.3, respectively, of the above Rules.

Docklift ship is a dry cargo ship adapted to carry cargo handling operations using the docking principle in ports and protected water areas.

1.2.8 Active means of the ship’s steering (AMSS) are special propulsion and steering units and any combination of them or with the main propulsion devices, capable of producing thrust or traction force both at a fixed angle to the centre line plane of the ship and at a variable angle, either under all running conditions or part thereof including small and zero speed.

The active means of the ship’s steering comprise steerable propellers including retractable units of all types, active rudders, vertical-axis propellers, waterjets, propellers in transverse tunnel (athwartship
thusters), separate nozzle rudders and other devices of similar purpose.

Requirements for AMSS construction and design, exclusive of the separate nozzle rudders and rudder section of the active rudders are outlined in Part VII "Machinery Installations". Requirements for AMSS used in the dynamic positioning systems of Mobil Offshore Drilling Units shall be fulfilled with consideration for Rules for the Classification and Construction of Mobil Offshore Drilling Units.

1.2.9 Steering gear.

Main steering gear is the machinery, rudder actuators, steering gear power units, if any, ancillary equipment and the means of applying torque to the rudder stock (e.g. tiller or quadrant) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.

Auxiliary steering gear is the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear, but not including the tiller, quadrant or components serving the same purpose.

Steering gear power unit is:
- in the case of electric steering gear an electric motor and its associated electrical equipment;
- in the case of electrohydraulic steering gear an electric motor and its associated equipment and connected pump;
- in the case of other hydraulic steering gear a driving engine and connected pump.

Power actuating system is the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a steering gear power unit or units, together with the associated pipes and fittings, and a rudder actuator. The power actuating systems may share common mechanical components, i.e. tiller, quadrant and rudder stock, or components serving the same purpose.

Steering gear control system is the equipment by which orders are transmitted from the navigating bridge to the steering gear power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.

1.2.1 Rudder and steering gear:

- .1 rudder stocks;
- .2 rudders;
- .3 nozzle rudders;
- .4 rudder axles;
- .5 pintles of rudders and nozzle rudders;
- .6 bushes of pintles;
- .7 fastenings of rudder stocks, rudder stock with rudder or nozzle rudder, and also of rudder axle with sternframe (muff couplings, keys, bolts, nuts, etc.);
- .8 parts of the system of rudder stops;
- .9 active means of the ship's steering (only in the case specified in 2.1.3.2).

1.3.2.2 Anchor arrangement:

- .1 anchors;
- .2 chain cables or ropes;
- .3 anchor stoppers;
- .4 devices for securing and releasing the inboard end of chain cable or rope;
- .5 anchor hawse pipes.

1.3.2.3 Mooring arrangement:

- .1 mooring ropes;
- .2 mooring bollards, belaying cleats, fairleaders, chocks, rollers and stoppers.

1.3.2.4 Towing arrangement:

- .1 tow lines;
- .2 towing bollards, bits, fairleaders, chocks and stoppers;
- .3 tow hooks and towing rails with fastenings for their securing to ship's hull;
- .4 towing snatch-blocks.

1.3.2.5 Masts and rigging:

- .1 metal, wooden and glass-reinforced plastic spars;
- .2 standing ropes;
- .3 permanent attachments to masts and decks (eyeplates, hoops, etc.);
- .4 loose gear of masts and rigging (shackles, turnbuckles, etc.).

1.3.2.6 Closing appliances of openings in hull, superstructures and deckhouses:

- .1 side and deck scuttles;
- .2 doors of cargo ports and other similar openings;
- .3 doors in superstructures and deckhouses;
- .4 companion hatches, skylights and ventilating trunks;
- .5 ventilators;
- .6 manholes to deep and other tanks;
- .7 hatchway covers in dry cargo ships and tankers;
- .8 cargo tank hatchway covers in tankers;
- .9 doors in subdivision bulkheads.

1.3.2.7 Equipment of ship's spaces:

- .1 ceiling and battens in cargo holds;
- .2 exit doors from ship's spaces in escape routes;
- .3 stairways and vertical ladders;
- .4 guard rails, bulwark and gangways;

1.3.1 General provisions on supervision of ship's equipment, arrangements and outfit are given in General Regulations for the Supervision and in Part I "Classification".

1.3.2 The following items included into ship's equipment, arrangements and outfit are subject to the supervision by the Register during their manufacture:

1.3.2.1 Rudder and steering gear:
.5 cellular guide members in the holds of container ships.

1.3.2.8 Emergency outfit:
.1 collision mats;
.2 tools;
.3 materials.

1.3.2.9 Miscellaneous equipment:
.1 chains of cargo handling appliances and of other gear;
.2 ropes of cargo handling appliances and of other gear.

1.3.3 The Register’s supervision of the manufacture of items specified in 1.3.2.1.6—1.3.2.1.9, 1.3.2.2.5, 1.3.2.3.2, 1.3.2.4.2, 1.3.2.5, 1.3.2.6.5, 1.3.2.6.6, 1.3.2.7 and 1.3.2.8 is confined to consideration of the relevant technical documentation.

1.3.4 For items specified in 1.3.2 the following documents shall be submitted to the Register:
.1 assembly drawing;
.2 calculations (no approval stamps are needed);
.3 detail drawings if parts or assemblies are not manufactured in accordance with standards and specifications approved by the Register.

1.3.5 Materials used for items specified in 1.3.2.1.1—1.3.2.1.5, 1.3.2.2.1, 1.3.2.2.2, 1.3.2.4.3, 1.3.2.6.2, 1.3.2.6.7 and 1.3.2.6.9 are subject to supervision of the Register during manufacture.

1.3.6 The following equipment, arrangements and outfit are subject to supervision of the Register when the ship is under construction:
.1 rudder and steering gear;
.2 anchor arrangement;
.3 mooring arrangement;
.4 towing arrangement;
.5 masts and rigging;
.6 openings in hull, superstructures and deckhouses and their closing appliances;
.7 arrangement and equipment of ship’s spaces;
.8 emergency outfit;
.9 cellular guide members in the holds of container ships;
.10 active means of the ship’s steering (see 2.1.3).

1.4 GENERAL PROVISIONS

1.4.1 In ships intended to carry in bulk flammable liquids with the flash point 60 °C and below no deck machinery is to be fitted directly on the decks being the top of cargo tanks and bunkers. In this case, the deck machinery is to be fitted on special foundations, the construction of which provides for free circulation of air underneath the machinery.

1.5 WORKING AND ALLOWABLE STRESSES

1.5.1 Wherever the working stresses are mentioned in the text of the present Part of the Rules, they mean combined stresses $\sigma_{\text{com}}$, in MPa, calculated from the formula

$$\sigma_{\text{com}} = \sqrt{\sigma^2 + 3\tau^2}$$  \hspace{1cm} (1.5.1)

where $\sigma$ = normal stresses in the section under consideration, MPa; $\tau$ = shear stresses in the section under consideration, MPa.

The strength conditions shall be checked against these stresses.

1.5.2 Allowable stresses with which the combined stresses are to be compared when verifying the strength conditions are specified in the present Part in fractions of the upper yield stress of the material used; the upper yield stress shall not be taken as more than 0.7 times the tensile strength of this material, unless expressly provided otherwise.

1.6 MATERIALS AND WELDING

1.6.1 Steel forgings and castings, steel plates, sections and bars and also chain steel used for items specified in 1.3.2.1.1—1.3.2.1.5, 1.3.2.1.7, 1.3.2.2.1, 1.3.2.2.2, 1.3.2.4.3, 1.3.2.6.2, 1.3.2.6.7 and 1.3.2.6.9 shall meet the relevant requirements of Part XIII "Materials". Materials for other items of equipment, arrangements and outfit shall meet the requirements specified in the design documentation approved by the Register, unless expressly provided otherwise in these Rules.

1.6.2 The grades of steel plates and sections (see Tables 3.2.2.1 and 3.2.2.2, Part XIII "Materials") for items specified in 1.3.2.1.2 and 1.3.2.1.3 shall be selected according to 1.2.3.1, Part II "Hull" in the same manner as for hull structural members of category II; in this case, for ships of ice categories J4 and higher and for icebreakers steel not lower than Grade B shall be adopted, and for rudder blades of icebreakers, not lower than Grade D. For items specified in 1.3.2.6.2 the grades of steel plates and sections of the main carrying framing members and plating of cover structures ensuring fixing of items when stowed for sea, as well as essential parts of drivers intended for opening at sea shall be selected according to 1.2.3.1, Part II "Hull" as for hull structural members of category II.

1.6.3 Welding of structural elements of ship’s equipment, arrangements and outfit shall be performed in accordance with the requirements of Part XIV "Welding"; besides, welded structures and joints of items specified in 1.3.2.6.2, 1.3.2.6.7 and
1.3.2.6.9 shall comply with the applicable requirements of Chapter 1.7 of Part II "Hull".

1.7 DESIGN ACCELERATIONS DUE TO HEAVE OF THE SEA

1.7.1 The dimensionless, gravity related, design accelerations due to heave of the sea as described in this Chapter are to be applied when determining the loads upon equipment, arrangements and batches of cargo items carried by ships of unrestricted service and those of restricted area of navigation I.

With regard to ships of other areas of navigation, accelerations may be applied different from those required herein which are to be substantiated by calculations approved by the Register.

1.7.2 The dimensionless acceleration \( a_x \) due to heave, pitch and roll normal to the water planes of the ship is to be determined from the formula

\[
a_x = \pm a_0 \sqrt{1 + \left( 3.5 - \frac{45}{L} \right) \left( \frac{x}{L} - 0.45 \right) \left( \frac{0.55}{C_B} \right)^2}
\]

(1.7.2-1)

where \( a_0 = 0.2 \sqrt{\frac{V}{L}} + \frac{34 - 600/L}{L} \); \( V \) = maximum ahead speed, in knots, with the ship on summer load waterline on still water; \( L \) = ship’s length, in m; \( x \) = longitudinal distance from the centre of gravity of equipment, arrangement or batch of cargo items in question to the aft perpendicular; \( C_B \) = block coefficient; \( a_x \) does not include the component of the static weight.

1.7.3 The dimensionless acceleration \( a_y \) due to transverse displacement, yaw and roll normal to the centre line of the ship is to be determined from the formula

\[
a_y = \pm a_0 \sqrt{0.6 + 2.5 \left( \frac{X}{L} - 0.45 \right)^2 + k_1 \left( 1 + 0.6k_2 \frac{z}{B} \right)^2}
\]

(1.7.3-1)

where \( k_1 = \) coefficient of stability to be determined from the formula

\[
k_1 = \frac{12GM}{B}
\]

(1.7.3-2)

where \( k_1 \) as determined from Formula (1.7.3-2), is below 1.0, \( k_1 = 1.0 \) should be assumed for calculating \( a_y \). \( GM \) = transverse metacentric height of loaded ship when the volume and distribution of stores are such as to yield maximum \( GM \), in m; \( B \) = ship’s breadth, in m; \( z \) = vertical distance, in m, from the summer load waterline to the centre of gravity of equipment, arrangement or batch of cargo items in question; \( z \) is positive above and negative below the summer load waterline.

\( a_y \) includes the component of the static weight in the transverse direction due to rolling.

1.7.4 The dimensionless acceleration \( a_z \) due to longitudinal displacement and pitch normal to the midship section plane is to be determined from the formula

\[
a_z = \pm a_0 \sqrt{0.06 + k_2^2 - 0.25k_2}
\]

(1.7.4-1)

where \( k_2 = \) factor determined from the formula

\[
k_2 = (0.7 - \frac{L}{1200}) \left( \frac{z}{L} \right) \left( \frac{0.6}{C_B} \right)
\]

(1.7.4-2)

\( a_z \) includes the component of the static weight in the longitudinal direction due to pitching.

1.7.5 When determining loads it should be considered that the accelerations calculated using \( a_x \), \( a_y \) and \( a_z \) act independently of each other.

2 RUDDER AND STEERING GEAR

2.1 GENERAL PROVISIONS

2.1.1 Every ship, except for shipborne barges, is to be provided with a reliable device ensuring her steering and course-keeping facilities (see 2.10). Such devices may be rudder, nozzle rudder, etc., approved by the Register.

In the case of non-propelled vessels of the dredging fleet with regard to the area of navigation and service conditions the Register may allow to omit such device or provide only stabilizers. The area of navigation and service conditions taken into account when it is allowed to omit such device or to provide only stabilizers are subject to special consideration by the Register in each case.

2.1.2 The present Section applies only to ordinary streamlined rudders or nozzle rudders with streamlined profiles and rigidly fixed stabilizers.

Unordinary rudders, nozzle rudders with steerable stabilizers, Voith-Schneider propellers, etc. are subject to special consideration by the Register in each case.
2.1.3 Active means of the ship’s steering.

2.1.3.1 The active means of the ship’s steering may be both the means supplementary to the regulated minimum (see 2.1.1) and the main means of the ship’s steering.

2.1.3.2 Taking into account the ship’s purpose, design features and intended service conditions it may be permitted, on agreement with the Register, that the regulated steerability of the ship should be provided at the low speed by simultaneous operation of the devices specified in 2.1.1 and the active means of the ship’s steering.

In case where the AMSS are the main means of the ship’s steering the regulated steerability shall be ensured under those running conditions of the ship for which the means are intended.

In any case, it shall be demonstrated by the method recognized by the Register that the steerability will not then be at least worse than that ensured in case of fulfilment of the requirements of 2.10.

2.1.4 The number of rudder pintles supporting the rudder is not regulated by the Register, except for icebreakers and ships of ice categories JY4 and higher for which this number is to be not less than that given in Table 2.1.4.

<table>
<thead>
<tr>
<th>Categories of icebreakers and ice strengthening in ships</th>
<th>Number of rudder pintles</th>
</tr>
</thead>
<tbody>
<tr>
<td>JY9, JY8</td>
<td>4</td>
</tr>
<tr>
<td>JY7, JY6, JY7, JY8, JY9</td>
<td>3</td>
</tr>
<tr>
<td>JY6, JY5</td>
<td>2</td>
</tr>
<tr>
<td>JY4</td>
<td>1</td>
</tr>
</tbody>
</table>

In exceptional cases, in icebreakers and ships of ice category JY7, JY8, JY9 the number of rudder pintles indicated in Table 2.1.4, may be reduced to 2 on agreement with the Register; the conditions under which this reduction may be permitted are subject to special consideration by the Register.

In icebreakers and ships of ice category JY7, JY8, JY9 the nozzle rudders are not to be fitted.

In ships of ice categories JY4, JY5, JY6 the arrangement of the nozzle rudder without the lower pintle in the solenoid is not permitted.

2.1.5 Wherever the upper yield stress $R_{eq}$ of the material used enters into the formulae of this Section, the provisions of 1.5.2 shall be taken into account, but in all cases the upper yield stress $R_{eq}$ of the material is not to be taken more than 390 MPa.

2.1.6 When checking the rudder pintles and rudder stock bearings for surface pressure, the latter is not to exceed the values indicated in Table 2.1.6.

2.1.7 In ships of ice category JY5, JY6 the arrangement of two nozzle rudders (in case of twin-screw ships) is subject to special consideration by the Register in each case.

2.1.8 In ships of ice categories JY4 and higher the structural measures for ice protection of nozzle rudders are subject to special consideration by the Register in each case.

2.2 INITIAL DESIGN DATA

2.2.1 The initial design data specified in this Chapter are valid only for the choice of scantlings of ordinary rudders and nozzle rudders with rigidly fixed stabilizers and cannot be used for determination of steering gear output characteristics. Methods of determination of these characteristics are not regulated by the Register, and the relevant calculations are not subject to approval by the Register. The steering gear is checked by the Register during sea trials of the ship to make sure that the steering gear output characteristics comply with the requirements of 2.9.2, 2.9.3 and 2.9.8.

2.2.2 Rudder force and rudder torque.

2.2.2.1 The rudder force $F$, in kN, for the ahead condition is to be determined from the formula

$$F = F_1 + F_2.$$  \hfill (2.2.2.1-1)

$F_1$ and $F_2$, in kN, are determined from the formulae:

$$F_1 = 5.59 \cdot 10^{-3} k_1 k_2 (6.5 + \lambda)(b_1 - C_b)^2 \frac{AV^2}{T},$$  \hfill (2.2.2.1-2)

$$F_2 = 0.177 k_1 (6.5 + \lambda) \frac{T}{D_p} A_p.$$  \hfill (2.2.2.1-3)

where $k_1$ = factor equal to:

1.0 for rectangular and trapezoidal rudders, except for rudders behind the rudder post;

0.95 for semispace rudders (rudders of types I, II, VII and VIII in Fig. 2.2.4.1);

0.89 for rudders behind the rudder post (rudders of types IV, X and XIII in Fig. 2.2.4.1);

$k_2$ = factor equal to:

1.0 for rudders operating directly behind the propeller;

1.25 for rudders not operating directly behind the propeller;
\[ \lambda = \text{value determined from the formula} \]

\[ \lambda = \frac{h_r}{A_1} \]  

(2.2.2.1-4)

where \( h_r \) = mean height of the rudder part abaft the centre line of the rudder stock, m;  

\( A_1 \) = sum of the rudder area and lateral area of the rudder horn or rudder post, if any, within the height \( H \), in m². In case of no rudder horn or rudder post, the value of \( A_1 \) is taken as \( A \) in the calculations;  

\( A \) = rudder area, in m²;  

\( A_r \) = portion of the rudder area in the wake of the propeller when the rudder is in the non-reversed position, m²;  

\( b_r \) = value equal to:  

2.2 for rudders situated at the centre plane of the ship;  

2.33 for side rudders;  

\( C_B \) = block coefficient with the ship on the summer load waterline;  

\( V \) = maximum ahead speed with the ship on the summer load waterline, in knots;  

\( T = \) propeller thrust at the speed \( V \), kN, (see 2.2.2.6);  

\( D_r \) = propeller diameter, m.

### 2.2.2.2

The value of the force \( F \) specified in 2.2.2.1 is not to be taken less than \( F_3 \), in kN, determined from the formula

\[ F_3 = k_3 A \]  

(2.2.2.2)

where \( k_3 \) = factor equal to:

- 171 — for icebreakers of category \( \text{LI}^{9} \);
- 150 — for icebreakers of category \( \text{LI}^{8} \);
- 130 — for icebreakers of category \( \text{LI}^{7} \);
- 110 — for icebreakers of category \( \text{LI}^{6} \) and for ships of ice category \( \text{LI}^{9} \);
- 95 — for ships of ice category \( \text{LI}^{8} \);
- 81 — for ships of ice category \( \text{LI}^{7} \);
- 75 — for ships of ice category \( \text{LI}^{6} \);
- 66 — for ships of ice category \( \text{LI}^{5} \);
- 53 — for ships of ice category \( \text{LI}^{4} \);
- 18 — for other ships.

When the value of the force \( F_3 \) is greater than that of the force \( F \) specified in 2.2.2.1, in subsequent calculations the value of \( F_3 \) is taken instead of \( F \), and the value \( F_2 \) is taken equal to zero.

### 2.2.2.3

For the ahead condition the rudder torque \( M_r \), in kN·m, is not to be taken less than determined from the formula

\[ M_r = F \frac{A_1}{h_r} \left( 0.35 - \frac{A_1}{A} \right) \]  

(2.2.2.3-1)

where \( A_1 \) = portion of the rudder area forward of the centre line of the rudder stock, in m².

For single-plate solid-cast rudders with the leading edge aft of the rudder stock centre line \( A_1 \) is taken as the negative value of the area formed by the leading edge of the rudder and the rudder stock centre line.

For icebreakers and ships of ice categories \( \text{LI}^{4} \), \( \text{LI}^{5} \), \( \text{LI}^{6} \), \( \text{LI}^{7} \), \( \text{LI}^{8} \) and \( \text{LI}^{9} \) the rudder torque \( M_r \), in kN·m, due to the force \( F_3 \) specified in 2.2.2.2, is not to be taken less than determined from the formula

\[ M_r = 0.35 F_3 b_r \]  

(2.2.2.3-2)

where \( b_r \) = distance from the centre line to the rear edge of the rudder at the level of the midheight of the rudder, m.

### 2.2.2.4

For the astern condition the rudder torque \( M_{as} \), in kN·m, is not to be taken less than determined from the formula

\[ M_{as} = k_4 \frac{A^2}{h_r} \left( 0.7 - \frac{A_1}{A} \right) v_{as}^2 \]  

(2.2.2.4)

where \( k_4 \) = factor equal to:  

- 0.185 — for rudders operating directly behind the propeller;  
- 0.139 — for rudders not operating directly behind the propeller;  

\( v_{as} \) = maximum specification speed of the ship for the astern condition, but not less than 0.5\( V \), knots.

### 2.2.2.5

For the astern condition the rudder force \( F_{as} \), in kN, is to be determined from the formula

\[ F_{as} = M_{as} \frac{h_r}{A \left( 0.7 - \frac{A_1}{A} \right)} \]  

(2.2.2.5)

When determining the bending moments and reactions of the supports according to the provisions of 2.2.4 to 2.2.7 for the astern condition, the force \( F_{as} \) should be considered as the force \( F_1 \), and the value of \( F_2 \) is then taken equal to zero.

### 2.2.2.6

In case reliable data are not available on the value of the propeller thrust mentioned in 2.2.2.1, the value of \( T \), in kN, may be determined from the formulæ:

- for fixed-pitch propellers

\[ T = 0.0441 \left( \frac{30.6 N_e}{\rho H_1^{3/2}} - n^2 D_r^4 \right) \]  

(2.2.2.6-1)

- for controllable-pitch propellers

\[ T = 0.0441 \left( \frac{110 N_e}{\rho (b_r - C_B)^{3/2}} - n^2 D_r^4 \right) \]  

(2.2.2.6-2)

where \( N_e \) = nominal total output of the propulsion plant of the ship divided by the number of the propellers, kW;  

\( n \) = number of propeller revolutions per second, s⁻¹;  

\( H_1 \) = propeller pitch at the zero thrust, in m, determined from the formula

\[ H_1 = H = \frac{0.055 D_r}{\theta + 0.3} \]  

(2.2.2.6-3)

\( H \) = design propeller pitch, m;  

\( \theta \) = blade area ratio;  

\( z \) = number of propeller blades.

### 2.2.3 Nozzle rudder force and torque.

#### 2.2.3.1

The total force \( F \), in kN, acting on the nozzle rudder and stabilizer is not to be taken less than determined from the formula

\[ F = F_n + F_{st} \]  

(2.2.3.1-1)

where \( F_n \) = force acting on the nozzle, in kN;  

\( F_{st} \) = force acting on the stabilizer, in kN.
\[ F_n = 9.81 \times 10^{-3} p D_n l_n^2 \]  
\[ F_{st} = 9.81 \times 10^{-3} q m A_{st} v_1^2 \]  
where \( D_n \) = inner minimum nozzle rudder bore, m; 
\( l_n \) = nozzle rudder length, m; 
\( A_{st} \) = area of nozzle rudder stabilizer, m²; 
\( v_1 \) = speed, in knots, determined from the formula 
\[ v_1 = \frac{r(1 - W)}{R} \] 
where \( W \) = average wake factor. In case reliable experimental data are not available, the wake factor may be determined from the formula 
\[ W = 0.165 C_b \sqrt{\frac{1}{A}} \]  
where \( C_b \) = block coefficient of the ship; 
\( A \) = displacement, m³, with the ship on summer load waterline; 
\( n \) = number of propellers; 
\( D_p \) = propeller diameter, m; 
\( v \) = maximum ahead speed, in knots, with the ship on summer load waterline; this speed is not to be taken less than: 
17 knots for ships of ice category \( \text{LY5} \), 
14 knots for ships of ice category \( \text{LY4} \), 
11 knots for other ships; 
p, q = coefficients determined from the formulae: 
\[ p = 78.4 - 55.6 \sqrt{\frac{v}{T}} + (44.0 - 33.4 \sqrt{\frac{v}{T}}) C_{HB} \]  
\[ q = 7.43 - 5.72 \sqrt{\frac{v}{T}} + (2.82 - 2.2 \sqrt{\frac{v}{T}}) C_{HB} \]  
\[ C_{HB} = \frac{9.387 T}{D_p^2 v_1^2} \]  
where \( T \) = propeller thrust at speed \( v \), kN; 
\( D_p \) = propeller diameter, in m; 
\( \lambda_\alpha \) is determined from the formula 
\[ \lambda_\alpha = l_n / \lambda \]  
\( m \) = coefficient determined from the formula 
\[ m = 4.5 - 0.12 (\lambda_\alpha - 5.43) \]  
\( \lambda_\alpha \) is determined from the formula 
\[ \lambda_\alpha = h_{st} / l_{st} \]  
\( h_{st} \) = height of nozzle rudder stabilizer, in m; 
\( l_{st} \) = length of nozzle rudder stabilizer, in m.

### 2.2.3.2 A point situated at the level of the longitudinal axis of the nozzle rudder at the distance \( r_n \) from the nozzle rudder leading edge should be considered as a point of application of force \( F_n \). The distance \( r_n \), in m, is not to be less than determined from the formula 
\[ r_n = l_{st} (bk + c) \]  
where \( k \) = coefficient determined from the formula 
\[ k = \frac{h_{st}}{l_{st}} \] 
\( l_{st} \) = distance between the centre line of the rudder stock and the leading edge of the nozzle rudder, in m; 
\( c \) = coefficients determined from the formula 
\[ c = 0.1585 - 0.0916 \sqrt{\frac{C_{HB}}{C_b}} \] 
A point situated at the level of the nozzle rudder longitudinal axis at the distance \( r_n \) from the stabilizer leading edge should be considered as a point of application of force \( F_{st} \). The distance \( r_{st} \), in m, is not to be less than determined from the formula 
\[ r_{st} = 0.25 l_{st} \] 

#### 2.2.3.3 The total torque \( M \), in kN·m, for the nozzle rudder is to be determined from the formula 
\[ M = M_n - M_{st} \]  
where \( M \) = total torque of force \( F_n \), in kN·m; 
\( M_n \) = total torque of force \( F_{st} \), in kN·m; 
\( M_n \) and \( M_{st} \) are determined from the formulae 
\[ M_n = \frac{28.1 F_n}{p} (0.72 l_n - l_{st}) + \frac{7.8 F_{st}}{q m} (l_n - l_{st} + 0.5 l_{st}) \] 

#### 2.2.4 Bending moments and reactions of supports for rudders of types I — IV, VI — XII and nozzle rudders of type V (Fig. 2.2.4.1)

### 2.2.4.1 The design values of the bending moments and reactions of supports are to be determined from the formulae of this Chapter depending on the types of the rudders shown in Fig.2.2.4.1 having regard to the provisions of Table 2.2.4.1 as well as the type and location of the steering gear as specified in 2.2.4.2.

<table>
<thead>
<tr>
<th>Type of rudder (see Fig.2.2.4.1)</th>
<th>Design value of load ( Q_2 )</th>
<th>Design value of load ( Q_1 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>I, II, VII, VIII</td>
<td>( Q_2 = \left( \frac{F_1}{A_1} + \frac{F_2}{A_2} \right) A_1 )</td>
<td>( Q_1 = F - Q_2 )</td>
</tr>
<tr>
<td>III — VI and IX — XII</td>
<td>( Q_2 = 0 )</td>
<td></td>
</tr>
</tbody>
</table>

Notes: 1. The value of \( A_1 \) is the portion the semispade rudder area below the lower pintle (below section 4 in Fig. 2.2.4.1), m².  
2. For nozzle rudders of type V the design value of the ratio \( l_{st} / l_\alpha \) is taken equal to zero.  
3. The force \( F \) is taken in accordance with the provisions of 2.2.2 for rudders and of 2.2.3 for nozzle rudders.

### 2.2.4.2 The transverse force \( P \), in kN, created on the rudder stock by steering gear (quadrant steering gears, steering gears with single-arm tillers and similar steering gears) is determined from the formula
Fig. 2.2.4.1

$G =$ gravity centre of the semispade rudder area lying below section 4;
$G_1 =$ gravity centre of the total rudder area;
$G_2 =$ gravity centre of the part of the rudder area coming under the propeller wash.

For rudder types VII — XII, the design value of the $l$ dimension is adopted equal to zero;
for rudder types III — XII, the design value of the $h$ dimension is adopted $h = l_2 - e$. 

Type I  Type II  Type III  Type IV  Type V  Type VI  
Type VII  Type VIII  Type IX  Type X  Type XI  Type XII  
Type XIII  Type XIV  Type XV
\[ P = M_1/r_1 \]  
(2.2.4.2)

where \( M_1 \) = rudder torque, kN.m, specified in 2.2.4.3 and 2.2.4.3.

For Case I of the quadrant steering gear or tiller location (see Fig. 2.2.4.2) the design value of bending moment \( M_1 \), in kN.m, in section 1 of the rudder stock (at the upper bearing) is to be determined from the formula

\[ M_1 = P_1 l_1 \]  
(2.2.4.6)

where \( P_1 \) and \( l_1 \) — see 2.2.4.2 and 2.2.4.4.

For Case II of the steering gear quadrant or tiller location \( M_1 \) is taken equal to zero.

2.2.4.7 The design value of the bending moment \( M_2 \), in kN.m, acting in section 2 of the rudder stock (at the lower bearing for rudders of types I-VI; in the rudder stock and rudder body coupling for rudders of types VII-XII) is to be determined from the formula

\[ M_2 = \frac{1}{8} Q_0 h \frac{k_5}{k_7} - \frac{1}{2} Q_0 c \frac{k_6}{k_7} - \frac{1}{2} P_1 l_1 \frac{k_8}{k_7} + \frac{1}{2} P_1 l_2 \frac{k_9}{k_7} \]  
(2.2.4.7-1)

where \( Q_0 \), \( Q_0 \) = loads determined in accordance with Table 2.2.4.1;

\( P_1 \), \( P_1 \) = forces determined in accordance with 2.2.4.2;

\( h \), \( c \), \( l_1 \), \( l_2 \) = linear dimensions (see 2.2.4.4);

\( k_5 \), \( k_6 \), \( k_7 \), \( k_8 \), \( k_9 \) = factors determined from the formulae:

\[ k_5 = 2 \left( \frac{c}{h} \right)^2 \left( 3 + \frac{c}{h} \right) + \left( 1 + 5 \frac{c}{h} \right) \frac{L_1}{L} + 12 \left( 1 + \frac{c}{h} \right) \frac{L_2}{L} \]  
(2.2.4.7-2)

\[ k_6 = \left( \frac{c}{h} \right)^2 \left( 3 + \frac{c}{h} \right) + \left( 1 + 3 \frac{c}{h} \right) \frac{L_1}{L} - 6 \left( \frac{c}{h} \right) \frac{L_2}{L} \]  
(2.2.4.7-3)

\[ k_7 = \left( 1 + \frac{c}{h} \right) \left( 1 + \frac{e}{h} + \frac{l_1}{h} \right) - 1 \frac{L_1}{L} + 3 \frac{L_2}{L} \]  
(2.2.4.7-4)

\[ k_8 = l_1 l_2 \frac{c}{h^2} \]  
(2.2.4.7-5)

\[ k_9 = l_1 l_2 \frac{c}{h^2} \left( 1 - \frac{l_2^2}{L_2} \right) \]  
(2.2.4.7-6)

where \( e \), \( l_1 \), \( l_2 \) = linear dimensions (see 2.2.4.4);

\( I_{cm} \) = mean moment of inertia of the rudder stock cross-section, cm²;

\( I_r \) = mean moment of inertia of the rudder cross-section at the portion between sections 3 — 4 (rudders types I — VI) or between sections 2 — 3 (rudders types VII — XII), cm²;

\( z_4 \) = coefficient determined in accordance with the provisions of 2.2.4.17 — 2.2.4.21 depending on the type of the rudder, m²/cm³.

2.2.4.8 The design value of the bending moment \( M_3 \), in kN.m, acting in section 3 of the rudder stock (in the rudder stock and rudder body coupling for rudders of types I — VI) is to be determined from the formula

\[ M_3 = M_2 \frac{h}{l_2} + Q_2 c \frac{e}{l_2} - \frac{1}{2} Q_0 h \frac{c}{l_2} \]  
(2.2.4.8)

2.2.4.9 The design value of the bending moment \( M_4 \), in kN.m, acting in section 4 of the rudders of types I, II, VII and VIII is to be determined from the formula

\[ M_4 = M_2 (z) \frac{h}{l_2} + Q_2 c \frac{e}{l_2} - \frac{1}{2} Q_0 h \frac{c}{l_2} \]  
(2.2.4.9)
\[ M_4 = Q_4 c. \quad (2.2.4.9) \]

For rudders of these types the value of \( M_4 \) is taken as the bending moment acting in any rudder cross-section above support 4 of the rudder.

For other rudders the value of the bending moment \( M_4 \) is taken equal to zero.

**2.2.4.10** The design value of the reaction \( R_1 \), in kN, of support 1 of the rudder (of the upper bearing) is to be determined from the formula

\[ R_1 = \frac{M_2}{l_1} - P_1\left(1 + \frac{l_2}{l_1}\right) - P_0\left(1 - \frac{l_3}{l_1}\right). \quad (2.2.4.10) \]

**2.2.4.11** The design value of the reaction \( R_2 \), in kN, of support 2 of the rudder (of the lower bearing for rudder types I — VI, of the upper bearing of the rudder axle for rudder type XI, of the upper pintle of rudders for types VII — X and XII) is to be determined from the formula

\[ R_2 = -M_2\left(1 + \frac{1}{l_1}\right) + Q_2 c\left(1 + \frac{1}{l_2}\right) - \frac{1}{2} Q_1 h - P_1\left(1 + \frac{h}{l_1}\right) - P_2\left(1 - \frac{l_3}{l_1}\right). \quad (2.2.4.11) \]

**2.2.4.12** The design value of the reaction \( R_3 \), in kN, of support 3 of the rudder (of the lower pintle) is to be determined from the formula

\[ R_3 = \frac{M_2}{l_2} - Q_2(1 + \frac{1}{l_2}) - Q_3(1 + \frac{1}{l_2}). \quad (2.2.4.12) \]

**2.2.4.13** The design value of the bending moment \( M_r \), in kN\(\text{m} \), acting in the considered section of the lower part of the semisapde rudder body (below section 4 shown in Fig. 2.2.4.1 for rudder types I, II, VII and VIII) is to be determined from the formula

\[ M_r = \frac{1}{2} Q_{3b} y_b^2 \quad (2.2.4.13) \]

where \( y_b \) is linear dimensions (see 2.2.4.4).

**2.2.4.14** The design value of the bending moment \( M_r \), in kN\(\text{m} \), acting in any cross-section of the rudders of types III, IV, VI and IX — XII is to be determined from the formula

\[ M_r = \frac{l_3}{2} M_2\left(2 - \frac{h}{l_2}\right) - \frac{M_2}{Q_4 l_2} - \frac{1}{8} Q_1 h\left(2 - \frac{h}{l_2}\right)^2. \quad (2.2.4.14) \]

**2.2.4.15** The design value of the bending moment \( M_{r_a} \), in kN\(\text{m} \), acting in the section of the rudder axle near its flange is to be determined from the formula

\[ M_{r_a} = \frac{R_4 l_4}{4}\left(0.42\left(\frac{l_4 - 0.3l}{l_4}\right) + 0.24\left(\frac{l_5}{l_4}\right) \frac{l_{r_p}}{l_4} + 0.15\left(\frac{l_5}{l_4}\right)^2\right) \quad (2.2.4.15) \]

where \( l_4, l_5 \) are linear dimensions (see 2.2.4.4); \( l_{r_p} \) mean moment of inertia of the rudder axle or rudder post cross-section, cm\(^4\); \( l_r \) mean moment of inertia of the whole rudder axis, cm\(^2\).

**2.2.4.16** For Case II of the steering gear quadrant or tiller location (see Fig. 2.2.4.2) the design value of the bending moment \( M_s \), in kN\(\text{m} \), acting in the section of the rudder stock in way of the quadrant or tiller location is to be determined from the formula

\[ M_s = R_1 l_8. \quad (2.2.4.16) \]

For Case I of the steering gear quadrant or tiller location \( M_s \) is taken equal to zero.

**2.2.4.17** The coefficient \( \chi \), in m\(^2\)/cm\(^3\), for rudders of types I and VII (for the horn of the semisapde rudder) is to be determined from the formula

\[ \chi_a = \frac{1.07I_5}{l_5} \left(4 - \frac{b_{y0}}{b_{y1}}\right) + \frac{1.3I_5^2}{l_5^2} \left(1 + \frac{b_{y1}}{b_{y0}}\right) \frac{b_{y0}}{b_{y1}} \quad (2.2.4.17-1) \]

where \( l_5 \) is linear dimension (see 2.2.4.4); \( I_5 \) is moment of inertia of the rudder horn cross-section at its root about the axis parallel to the centre plane of the ship, cm\(^4\); \( b_{y0} \) is maximum width of the horizontal section of the rudder horn at the lower pintle (section 4 in Fig. 2.2.4.1), m; \( b_{y1} \) is maximum width of the horizontal section of the rudder horn at its root, m; \( I_2 \) is polar moment of inertia of the rudder horn cross-section at its root, cm\(^4\), determined from the formula

\[ l_3 = \frac{4A_{y}}{\sum_{i=1}^{n} l_{y0} l_{y0}} \quad (2.2.4.17-2) \]

where \( A_{y} \) is area enclosed by the centre line of the rudder horn plating (with the cross-section at the horn root), cm\(^2\); \( l_{y0} \) is length of the centre line of the rudder horn plating (in the cross-section at the horn root) of the given thickness, cm; \( s_{y0} \) is thickness of the considered portion of the rudder horn plating with the length \( l_{y0} \), cm; \( n \) is number of portions of the rudder horn plating with the length \( l_{y0} \) and thickness \( s_{y0} \).

**2.2.4.18** The coefficient \( \chi_a \), in m\(^2\)/cm\(^3\), for rudders of types III, V and IX (for the semisapde) is to be determined from the formula

\[ \chi_a = \frac{l_3^3}{4A_{y1}} \left(4 - \frac{b_{y0}}{b_{y1}}\right) \quad (2.2.4.18) \]

where \( l_3 \) is moment of inertia of the rudder horn cross-section at its root about the vertical axis, cm\(^4\); \( b_{y0} \) is width of the rudder horn plating at the rudder or nozzle rudder pintle, cm; \( b_{y1} \) is width of the rudder horn cross-section at its root, cm.
2.2.4.19 The coefficient \( z_4 \), in \( m^3/cm^4 \), for rudders of types IV and X (for the rudder post with the solepiece) is to be determined from the formula

\[
z_4 = \frac{F}{3s} \left( 0.075 \frac{I}{L_{op}} + 0.334 \frac{l_4}{l_3} \right). \tag{2.2.4.19}
\]

2.2.4.20 The coefficient \( z_4 \), in \( m^3/cm^4 \), for rudders of type XI (for rudder axle with the solepiece) is to be determined from the formula

\[
z_4 = \frac{F}{3s} \left( 0.075 \frac{I}{L_{op}} + 0.334 \frac{l_4}{l_3} - 0.282 \frac{(l_4 - l_2)}{l_4} \right) \times \left[ 1.5 \frac{l_4}{l_3} + 0.053 \left( \frac{l_4}{l_3}^2 + \frac{(l_4 - l_2)}{l_4} \right) \right]. \tag{2.2.4.20}
\]

2.2.4.21 The coefficient \( a_4 \) for rudders of types II, VI, VIII and XII is to be taken equal to zero.

2.2.5 Bending moments and reactions of supports for rudder type XIII (Fig. 2.2.4.1).

2.2.5.1 The requirements of 2.2.4.2 to 2.2.4.6 and 2.2.4.16 are also applicable to the rudders of type XIII.

2.2.5.2 The design value of the bending moment acting in way of the rudder stock and rudder body coupling is to be taken equal to zero.

2.2.5.3 The design value of the bending moment \( M_r \), in kN⋅m, acting in any cross-section of the rudder is to be taken from the formula

\[
M_r = 0.1 F h_0^2 \frac{l_0}{h_0}, \tag{2.2.5.3}
\]

where
- \( F \) = force determined according to the provisions of 2.2.2.1, 2.2.2.2 and 2.2.2.5, kN;
- \( h_0, h_c \) = linear dimensions (see 2.2.4.4); in this case, the greater of the value \( h_0 \) is to be taken as the design value.

2.2.5.4 The design value of the reaction \( R_1 \) of support 1 of the rudder (of the upper bearing) is to be taken equal to zero.

2.2.5.5 The design value of the reaction \( R_2 \), in kN, of support 2 of the rudder (of any pintle) is to be determined from the formula

\[
R_2 = F h_0^2 \frac{l_0}{h_0}. \tag{2.2.5.5}
\]

2.2.6 Bending moments and reactions of supports for rudder type XIV (Fig. 2.2.4.1).

2.2.6.1 The requirements of 2.2.4.2 to 2.2.4.6 and 2.2.4.16 are also applicable to the rudders of type XIV.

2.2.6.2 The design value of the bending moment \( M_2 \), in kN⋅m, acting in section 2 of the rudder stock (at the lower bearing) is to be determined from the formula

\[
M_2 = F_1 c_1 + F_2 c_2 \tag{2.2.6.2}
\]

where
- \( F_1, F_2 \) = forces determined according to the provisions of 2.2.2.1, 2.2.2.2 and 2.2.2.5, kN;
- \( c_1, c_2 \) = linear dimensions (see 2.2.4.4), m.

2.2.6.3 The design value of the bending moment \( M_3 \), in kN⋅m, acting in section 3 of the rudder stock (in the rudder stock and rudder body coupling) is to be determined from the formula

\[
M_3 = F_1 (c_1 - e) + F_2 (c_2 - e) \tag{2.2.6.3}
\]

where \( e \) = linear dimension (see 2.2.4.4), m.

2.2.6.4 The design value of the bending moment \( M_r \), in kN⋅m, acting in the considered section of the rudder body is to be determined from the formulae:

\[
M_r = \frac{1}{2} \left( \frac{F_1}{h_0} + \frac{F_2}{h_1} \right) y^2 \tag{2.2.6.4-1}
\]

for sections with \( y < h_1 \)

\[
M_r = \frac{1}{2} \left( \frac{F_1}{h_r} y^2 + F_2 (y - \frac{1}{2} h_1) \right) \tag{2.2.6.4-2}
\]

where \( h_r, h_1 \) and \( y \) = linear dimensions (see 2.2.4.4), m.

2.2.6.5 The design value of the reaction \( R_1 \), in kN, of support 1 of the rudder (of the upper bearing) is to be determined from the formula

\[
R_1 = F_1 \frac{c_1}{l_1} + F_2 \frac{c_2}{l_2} - P_l \left(1 + \frac{l_2}{l_1}\right) - P_l \left(1 - \frac{l_2}{l_1}\right) \tag{2.2.6.5}
\]

where \( l_1 \) = linear dimension (see 2.2.4.4), m.

2.2.6.6 The design value of the reaction \( R_2 \), in kN, of support 2 of the rudder (of the lower bearing) is to be determined from the formula

\[
R_2 = F_1 \left(1 + \frac{c_1}{l_1}\right) + F_2 \left(1 + \frac{c_2}{l_2}\right) - P_l \frac{l_2}{l_1} + P_l \frac{l_1}{l_1} \tag{2.2.6.6}
\]

2.2.7 Bending moments and reactions of supports for nozzle rudders of type XV (Fig. 2.2.4.1).

2.2.7.1 The requirements of 2.2.4.2 to 2.2.4.4, 2.2.4.6 and 2.2.4.16 are also applicable to the nozzle rudder of type XV.

2.2.7.2 The design value of the bending moment \( M_2 \), in kN⋅m, acting in section 2 of the rudder stock (at the lower bearing) is to be determined from the formula

\[
M_2 = F c_1 \tag{2.2.7.2}
\]

where
- \( F \) = force determined according to the provisions of 2.2.3.1, kN;
- \( c_1 \) = linear dimension (see 2.2.4.4), m.

2.2.7.3 The design value of the bending moment \( M_3 \), in kN⋅m, acting in section 3 of the rudder stock (at the rudder stock and nozzle rudder coupling) is to be determined from the formula

\[
M_3 = F (c_1 - e) \tag{2.2.7.3}
\]

where \( e \) = linear dimension (see 2.2.4.4), m.
2.2.7.4 The design value of the reaction \( R_1 \), in kN, of support 1 (of the upper bearing) is to be determined from the formula

\[
R_1 = F \frac{c_1}{l_1} - P_1 \left( 1 + \frac{l_2}{l_1} \right) - P_H \left( 1 - \frac{l_3}{l_1} \right)
\]  

(2.2.7.4)

where \( l_1 \) = linear dimension (see 2.2.4.4), m.

2.2.7.5 The design value of the reaction \( R_2 \), in kN, of support 2 (of the lower bearing) is to be determined from the formula

\[
R_2 = F \left( 1 + \frac{c_1}{l_1} \right) - P_1 \frac{l_2}{l_1} + P_H \frac{l_3}{l_1}.
\]  

(2.2.7.5)

2.2.8 The design values of bending moments and reactions of supports for the steering gears which differ from those indicated in Fig. 2.2.4.1 are subject to special consideration by the Register.

2.3 RUDDER STOCK

2.3.1 The diameter of the rudder head \( d_0 \), in cm, is to be not less than the greater value determined from the formula

\[
d_0 = k_{10} \sqrt[3]{M_1/\sigma_{RCH}}
\]  

(2.3.1)

where

- \( k_{10} \) = factor equal to:
  - 26.1 for the ahead condition;
  - 23.3 for the astern condition;
- \( M_1 \) = torque according to 2.2.2.3, 2.2.2.4 or 2.2.3.3, kN·m;
- \( \sigma_{RCH} \) = upper yield stress of the rudder stock material, MPa.

2.3.2 Under combined action of the torque and bending moment the working stresses (see 1.5.1) acting in rudder stock sections 1, 2 or 3 shown in Fig. 2.2.4.1 for the appropriate type of the rudder are not to exceed 0.5 times the upper yield stress for the ahead condition and 0.7 times the upper yield stress of the material for the astern condition (see 1.5.2 and 2.1.5). In this case, the normal stress \( \sigma \) and the shear stress \( \tau \), in MPa, are to be determined from the formulae:

\[
\sigma = 10.2 \cdot 10^3 M_2/d_0^2,
\]  

(2.3.2.1)

\[
\tau = 5.1 \cdot 10^3 M_1/d_0^2
\]  

(2.3.2.2)

where

- \( M_2 \) = bending moment acting in the considered section of the rudder stock (\( M_1 \), \( M_2 \) or \( M_3 \)) determined according to the provisions of 2.2.4 to 2.2.7 for the appropriate type of the rudder, kN·m;
- \( d_0 \) = diameter of the rudder stock in the considered section, cm.

2.3.3 The change in the rudder stock diameter between the adjacent sections specified in 2.3.1 and 2.3.2 is not to be more sudden than that permitted by the linear law.

Where the change of the rudder stock diameter is stepped, the steps are to be provided with fillets having as large radius as practicable. The transition of the rudder stock into the flange is to be carried out with a radius of fillet of not less than 0.12 times the diameter of the rudder stock in any way of the flange.

2.4 RUDDER

2.4.1 Ordinary rudders.

2.4.1.1 The thickness of the streamlined rudder side plating \( s \), in mm, is to be not less than determined from the formula

\[
s = \frac{ak_{11}}{R_{ch}} \sqrt{98d + k_{12} \left( \frac{F_1 A_1 + k_{13} F_2}{A_{ch}} \right) + 1.5}
\]  

(2.4.1.1-1)

where

- \( d \) = draught of the ship, in m;
- \( F_1, F_2 \) = forces according to 2.2.2.1 and 2.2.2.2, kN;
- for \( A \) and \( A_{ch} \) see 2.2.2.1;
- \( a \) = distance between horizontal or vertical web plates, whichever is the lesser, m;
- \( k_{11} \) = factor determined from the formula

\[
k_{11} = \frac{10.85}{2.516 \left( \frac{d}{R_{ch}} \right)}
\]  

(2.4.1.1-2)

\( R_{ch} \) = upper yield stress of the rudder plating material, MPa;

\( b \) = distance between horizontal or vertical web plates whichever is the greater, m;

\( k_{12} \) = factor equal to:
- 18.6 for the rudder plating within 0.35 of the rudder length from its leading edge;
- 8.0 for the rudder plating within 0.65 of the rudder length from its rear edge;

\( k_{13} \) = factor equal to:
- 1 for the rudder plating in the wake of the propeller (when rudder is in the non-reversed position);
- 0 for the rudder plating beyond the wake of the propeller (when rudder is in the non-reversed position).

2.4.1.2 In any case, the thickness of the streamlined rudder side plating \( s_{\text{min}} \), in mm, is to be not less than determined from the formulae:

for ships of less than 80 m in length

\[
s_{\text{min}} = 21.5 \frac{L + 51}{L + 240}
\]  

(2.4.1.2-1)

for ships of 80 m in length and over

\[
s_{\text{min}} = 24.0 \frac{L + 37}{L + 240}
\]  

(2.4.1.2-2)

where

\( L \) = length of the ship, m.

2.4.1.3 For the ship assigned an ice category the thickness of the rudder side plating in way of the ice belt is to be not less than that of the ice belt of the shell plating in the after part of the ship, specified in 3.10.4.1 of Part II "Hull", with the frame spacing being equal to the distance between the vertical web plates of the rudder.

The thickness \( s \), in mm, of the rudder side plating for the icebreakers is to be not less than determined from the formula
\[ s = 9.2k_{16}\alpha \sqrt{\frac{p_u}{R_{yu}}} + 6 \] (2.4.1.3-1)

where
- \( k_{16} \) is the factor determined for streamlined welded rudders from the formula
- \( b \) is the distance between horizontal or vertical web plates, whichever is the greater, m.

For single-plate steel solid-cast rudders the value of \( k_{16} \) shall be taken in the calculations equal to 1.

2.4.1.4 The streamlined rudder side plating is to be stiffened from the inside by horizontal and vertical web plates. The thickness of the web plates is to be not less than that of the rudder side plating.

The side plating and web plates are to be welded together by fillet or plug welds with slots of linear form. Dimensions of elements of plug welds are selected according to 1.7.5.13, Part II "Hull". The thickness of the steel flats is to be not less than that of the rudder side plating.

The horizontal and vertical web plates are to be provided with sufficient number of openings for free drainage of water which may penetrate inside the rudder.

The rear edge of the rudder is to be rigidly fixed in the proper way.

2.4.1.5 The streamlined rudders are to be provided with top and bottom plates, the thickness of which is to be not less than 1.2 times the greater value of the side plating thickness according to 2.4.1.1. The top and bottom plates are to be fitted with drain plugs of corrosion-resistant metal.

2.4.1.6 The corners of the openings (in way of the pintles) in the side plating of the semispade rudder are to be rounded off. The radius of curvature is to be not less than 2 times the side plating thickness in this area, and the free edge of the rudder side plating is to be thoroughly stripped.

2.4.1.7 Near the rotation axis of the streamlined rudder one or several vertical web plates are to be provided ensuring the general strength of the rudder body. The section modulus of these web plates, including the effective flanges, is to be such that the normal stresses in the considered section are not more than 0.5 times the upper yield stress of the material of the rudder side plating (see 1.5.2).

The normal stresses \( \sigma \), in MPa, are to be calculated from the formula

\[ \sigma = 1000M_b/W \] (2.4.1.7)

where
- \( M_b \) is the bending moment in the considered section of the rudder (\( M_1 \) or \( M_2 \)) determined according to the provisions of 2.2.4 to 2.2.6 for the appropriate type of the rudder, kN·m;
- \( W \) is the section modulus of the considered section of the web plates, including the effective flanges, about the axis of symmetry of the rudder profile, cm³.

The dimensions of the effective flanges of the web plates are to be as follows:
- the thickness equal to that of the rudder side plating;
- the width equal to 1/6 of the rudder height or 1/2 of the distance between the nearest web plates located on both sides of the considered web plate, whichever is the less.

2.4.1.8 Special care is to be given to the reliable securing to the rudder body of the flange for coupling the rudder body and the rudder stock and of the gudgeons for pintles.

2.4.1.9 At the leading edge of the single-plate steel solid-case rudders of the ice-breakers the rudder piece is to be provided over the entire height of the rudder.

The combined stresses \( \sigma_{com} \), in MPa, developed in any horizontal section of the rudder piece and determined from the formula given below are not to exceed 0.5 times the upper yield stress of the rudder material

\[ \sigma_{com} = 1000\sqrt{(\frac{M_1}{W})^2 + 3\left(\frac{M_2}{h_pS}\right)^2} \] (2.4.1.9)

where
- \( M_1 \) is the bending moment determined according to the provisions of 2.2.5.3, kN·m;
- \( M_2 \) is the torque according to 2.2.2.3, kN·m;
- \( h_p \) is the height of the rudder measured on the rudder stock centre line, m;
- \( y \) is distance between the considered section and the lower edge of the rudder (Fig. 2.4.1.9), m;
- \( W \) is the section modulus of the considered cross-section of the rudder piece about the axis \( O_1-O_2 \), ignoring the rudder plating (the rudder piece section taken into account in the calculation of \( W \) is hatched in section 1 – 1 of Fig. 2.4.1.9), cm³;
- \( S \) is the area of the considered cross-section of the rudder piece (see hatched area in section 1 – 1 of Fig. 2.4.1.9), cm²;
- \( p \) is the distance between the centroid of the area \( S \) and the rudder stock centre line, cm.

![Fig. 2.4.1.9](image)
The section modulus of the considered cross-section of the rudder arms \( W \), in cm\(^3\), (including the body of the rudder within the dimension \( h_1 \), see section II — II in Fig. 2.4.1.9) about the axis \( O_2 — O_2 \) is to be not less than determined from the formula

\[
W = \frac{1000b_N x^2 F}{AR_{H}} \tag{2.4.1.10}
\]

where \( F \) = force determined according to the provisions of 2.2.2.2, kN;
\( A \) = rudder area, in m\(^2\);
\( b_N \) = linear dimension, m (see Fig. 2.4.1.9);
\( x \) = distance between the considered section and the rear edge of the rudder, m (see Fig. 2.4.1.9);
\( R_{H} \) = upper yield stress of the rudder material, MPa.

2.4.2 Nozzle rudders.

2.4.2.1 The thickness \( s_0 \), in mm, of the nozzle rudder outside plating is to be not less than determined from the formula

\[
s_0 = k_{1d} l_1 \sqrt{\frac{98D_n d + 20F_n}{D_n R_{H}}} + 2 \tag{2.4.2.1-1}
\]

where
- \( D_n \) = inner minimum nozzle bore, m;
- \( l_1 \) = length of the nozzle rudder, m;
- \( d \) = draft of the ship, m;
- \( F_n \) = force acting on the nozzle rudder according to 2.2.3.1, kN;
- \( R_{H} \) = upper yield stress of the material of the nozzle rudder outside plating, MPa;
- \( k_{1d} \) = factor determined from the formula

\[
k_{1d} = 7.885 - 2.221(\frac{l_1}{l_1})^2 \tag{2.4.2.1-2}
\]

- \( l_1 \) = distance between the longitudinal web plates measured along the length of the nozzle rudder outside plating, m. This distance is not to exceed 1000 mm;
- \( l_1 \) = distance between transverse web plates or between the transverse web plate and the nearest edge of the nozzle rudder, m. This distance is not to exceed 600 mm.

2.4.2.2 The thickness \( s_{m} \), in mm, of the nozzle rudder inside plating, except for its middle belt, is to be not less than:

\[
s_{m} = 6.39 \frac{l_1}{D_n} \sqrt{T} \tag{2.4.2.2-1}
\]

where
- \( T \) = propeller thrust at speed \( v \), kN.

The thickness \( s_{m} \), in mm, of the middle belt of the nozzle rudder inside plating is to be not less than:

\[
s_{m} = 7.34 \frac{l_2}{D_n} \sqrt{T} + 0.51 \frac{T}{D_n} \tag{2.4.2.2-2}
\]

where \( l_2 \) = distance between transverse web plates situated in way of the middle belt of the inside plating, in m.

In case of application of stainless or clad steel the value of \( s_{m} \) may be reduced on agreement with the Register.

2.4.2.3 In any case, the thickness of the outside and inside plating of the nozzle rudder is to be not less than that given in 2.4.1.2.

2.4.2.4 The middle belt of the nozzle rudder inside plating is to extend not less than 0.05\( D_n \) forward and not less than 0.1\( D_n \) aft of the propeller blade tips. Its breadth is to be at least equal to the maximum breadth of the side projection of the propeller blade.

2.4.2.5 The outside and inside plating of the nozzle rudder is to be stiffened from the inside by transverse and longitudinal web plates. The spacing of the web plates is to comply with the requirements of 2.4.2.1.

At least four longitudinal web plates are to be provided which are equally spaced around the circumference of the nozzle rudder.

The thickness of web plates, except those situated in way of the middle belt of the nozzle rudder inside plating, is to be not less than the thickness of the outside plating according to 2.4.2.1 and 2.4.2.3.

The transverse and longitudinal web plates are to be welded to the nozzle rudder inside plating by double side continuous welds with full penetration on the inside of the nozzle rudder. When the thickness of the web plates is 10 mm and more, edge preparation is to be carried out.

The outside plating and web plates are to be connected by plug welding with slots of linear form or by backing welding. The dimensions of elements of plug welds with slots of linear form are selected according to 1.7.5.13, Part II "Hull".

The transverse and longitudinal web plates are to be provided with sufficient number of opening for free drainage of water which might penetrate inside the nozzle rudder, and in the lower and upper parts of the outside plating the drain plugs of stainless metal are to be fitted. The distance from the opening edge to the inside and outside plating of the nozzle rudder is to be not less than 0,25 times the web plate height.

It is not allowed to weld on doubling plates to the inside plating of the nozzle rudder.

2.4.2.6 In way of the middle belt of the nozzle rudder inside plating at least two continuous transverse web plates are to be fitted. The thickness of these web plates is to be not less than the thickness of the inside plating off its middle belt as per Formula (2.4.2.2-1).

2.4.2.7 Special care is to be given to the reliable securing of the nozzle flange, welded-in bush and other nozzle rudder welded-in parts for connecting the nozzle rudder welded-in parts for connecting the nozzle rudder with its stock and pintle.

2.4.2.8 The thickness \( s_{n} \), of the stabilizer plating, in mm, is to be not less than determined from the formula

\[
W = \frac{1000b_N x^2 F}{AR_{H}} \tag{2.4.1.10}
\]

where \( F \) = force determined according to the provisions of 2.2.2.2, kN;
\( A \) = rudder area, in m\(^2\);
\( b_N \) = linear dimension, m (see Fig. 2.4.1.9);
\( x \) = distance between the considered section and the rear edge of the rudder, m (see Fig. 2.4.1.9);
\( R_{H} \) = upper yield stress of the rudder material, MPa.

2.4.2.9 The thickness of the stabilizer plating is to be not less than that determined in 2.4.1.2.

2.4.2.10 The thickness of the stabilizer plating in way of the middle belt of the nozzle rudder is to be not less than the thickness of the outside plating as per formula (2.4.2.1-1) and 2.4.2.3.

2.4.2.11 The transverse and longitudinal web plates are to be connected with the outside plating by butt welds and plug welds with slots of linear form B and C, respectively.
\[ s_{st} = k_{st} d_1 \left( \sqrt{\frac{98 A_{st} d + 20 F_{st}}{A_{st} R_{st}}} + 2 \right) \quad (2.4.2.8) \]

where \( A_{st} \) is the area of the nozzle rudder stabilizer, \( m^2 \);
\( F_{st} \) is the force acting on the stabilizer according to Formula (2.2.3.1-3), \( kN \);
\( k_{st} \) is the factor according to Table 2.4.2.1 when the distance between horizontal web plates equals to \( a_{st}, m \);
\( l_{st} \) is the distance between vertical web plates or between the web plate and fore or aft edge of the stabilizer, \( m \);
\( R_{st} \) is the upper yield stress of material of the stabilizer plate, MPa.

2.4.2.9 The nozzle rudder stabilizer platting is to be stiffened from the inside by horizontal and vertical web plates having the thickness not less than that of the platting in accordance with 2.4.2.8.

The stabilizer body is to terminate in top and bottom plates. The thickness of top and bottom plates is not to be less than 1.5 times the thickness of the platting according to 2.4.2.8. Vertical web plates are to be securely connected to top and bottom plates.

The platting and horizontal and vertical web plates are to be welded together by fillet or plug welds.

The types of plug welds with slots of linear form are selected according to 1.7.5.13, Part II "Hull".

The horizontal and vertical web plates are to be provided with sufficient number of openings, and top and bottom plates are to be fitted with drain plugs of corrosion-resistant material.

2.4.2.10 In way of attachment of the stabilizer to the nozzle rudder one or several vertical web plates are to be provided ensuring general strength of the stabilizer. The section modulus \( W_{st} \), in \( cm^3 \), of these web plates, the effective flange included, is to be not less than determined from the formula

\[ W_{st} = 1390 F_{st} h_{st} R_{st} \quad (2.4.2.10) \]

where \( F_{st} \) is the force acting on the stabilizer according to Formula (2.2.3.1-3), \( kN \);
\( h_{st} \) is the stabilizer height, \( m \);
\( R_{st} \) is the upper yield stress of the material used, MPa.

The effective flange dimensions are to be as follows: thickness equal to the stabilizer platting thickness; width equal to 1/5 of the stabilizer height.

2.4.2.11 The nozzle rudder and stabilizer are to be so connected that rigid fixation of the latter is ensured.

The force \( F_{st} \) determined from Formula (2.2.3.1-3) and uniformly distributed with the height of the stabilizer is to be taken in strength calculations as a force acting on the stabilizer. Depending on the type of connection a torque of force \( F_{st} \) acting on this connection is to be considered with regard to the point of application of this force (see Formula (2.2.3.2-3). In this case, stresses developed in the connection (see 1.5.1) shall not exceed 0.4 times the upper yield stress of the material.

2.5 COUPLINGS

2.5.1 Horizontal flange coupling.

2.5.1.1 The diameter of the coupling bolts \( d_1 \), in cm, is to be not less than:

\[ d_1 = 0.62 \sqrt{\frac{d_3 R_{sh}}{z_1 r_2 R_{sh}}} \quad (2.5.1.1-1) \]

where \( d_3 \) is the diameter of the rudder stock at the coupling flange, cm;
\( z_1 \) is the number of coupling bolts;
\( r_2 \) is the mean distance from the centre of the bolts to the centre of the system of the flange bolt holes, cm;
\( R_{sh} \) is the upper yield stress of the rudder stock material, MPa;
\( R_{sh} \) is the upper yield stress of the bolt material, MPa.

The coupling bolt diameter at the bottom of threads \( d_3 \), in cm, is to be not less than determined from the formula

\[ d_3 = 76.84 \sqrt{\frac{M_b}{z_1 r_3 R_{sh}}} \quad (2.5.1.1-2) \]

where \( M_b \) is the bending moment acting in the rudder stock section at the flange (\( M_2 \) or \( M_3 \)) determined according to the provisions of 2.2.4 to 2.2.7 for the appropriate type of the rudder, \( kN \cdot m \);
\( r_3 \) is the mean distance from the centre of the bolts to the longitudinal axis of symmetry of the flange, cm.

The number of bolts \( z_1 \) is to be not less than 6. The mean distance from the centre of the bolts to the centre of the system of the flange bolt holes is to be not less than 0.9 times the rudder stock diameter according to 2.3.1. When the coupling is under the action of the bending moment, the mean distance from the centre of the bolts to the longitudinal axis of symmetry of the flange is to be not less than 0.6 times the rudder stock diameter at the flange.

2.5.1.2 Only fitted bolts are to be employed, except the cases of a key setting when it is sufficient to have only two fitted bolts. The nuts shall have standard sizes. The bolts and nuts shall be efficiently secured.

2.5.1.3 The thickness of the coupling flanges is not to be less than the diameter of the bolts. The centres of the holes for bolts are to be distant from the outside edges of the flange by not less than 1.15 times the diameter of the bolts.

2.5.1.4 When coupling flanges of nozzle rudders are not built into the nozzle rudder body but connected to it by the structure formed of sheets, the strength of this structure shall be equivalent to that of the rudder stock in accordance with 2.3.2. In this case, the calculated combined stress shall not exceed 0.4 times the upper yield stress of the material used.

2.5.2 Keyed cone coupling.

2.5.2.1 Where the rudder stock has a tapered lower end fitted to the rudder or nozzle rudder and secured by nut and key, the length of the taper is not
to be less than 1.5 times the diameter of the rudder stock according to 2.3.2 and the taper is not to be greater than 1:10 on the diameter. The taper is to change into cylindrical portion without any step in the diameter.

2.5.2.2 A key is to be set on the cone generatrix.

The ends of the key are to be fairly rounded. The working sectional area of the key \( A_k \) (product of the key length by its width), in \( \text{cm}^2 \), shall be not less than the greater value determined from the formula

\[
A_k = \frac{k_{15} M_t}{d_{\text{m}} R_{\text{uy}}} \tag{2.5.2.2}
\]

where \( k_{15} = \) factor equal to:
- 6920 for rudders for the ahead condition and for nozzle rudders;
- 4950 for rudders for the astern condition;
\( M_t = \) torque according to 2.2.2.3, 2.2.2.4 or 2.2.3.3, \( \text{kN} \cdot \text{m} \);
\( d_{\text{m}} = \) mean diameter of the rudder stock taper, \( \text{mm} \);
\( R_{\text{uy}} = \) upper yield stress of the key material, \( \text{MPa} \).

The height of the key shall be not less than half its width.

The keyway of the rudder stock shall be confined to the tapered coupling.

2.5.2.3 The external diameter of the rudder stock threaded portion is not to be less than 0.9 times the minimum diameter of the taper. The thread is to be fine. The outer diameter and height of the nut are not to be less than 1.5 and 0.8 times the external diameter of the rudder stock threaded portion, respectively. To prevent self-unscrewing, the nut is to be securely fastened at least by two weld-on strips or one weld-on strip and a split pin.

2.5.3 Keyless cone coupling.

2.5.3.1 The requirements of 2.5.3 are applicable to a keyless fitting of the stock to the rudder or nozzle rudder which is made by oil injection method.

2.5.3.2 The taper length of the stock fitted to the rudder or nozzle rudder is not to be less than 1.5 times the diameter of the stock according to 2.3.2; the taper on the diameter is to be 1:15.

2.5.3.3 The rudder or nozzle rudder is to be a good fit on the rudder stock cone. During the fit up, and before the push-up load is applied, an area of contact of at least 70 per cent of the theoretical area of contact is to be achieved, and this is to be distributed evenly.

The relationship of the rudder or nozzle rudder to stock at which this occurs is to be marked, and push-up length then measured from that point.

In well-founded cases another method of determining the original position of the stock and boss cones relationship can be used on agreement with the Register.

2.5.3.4 To ensure the required interference in the cone coupling the push-up length of the rudder stock (see 2.5.3.3) during its fitting shall be not less than determined from the formula

\[
S_1 = \frac{1.1 q}{E K} \left[ \frac{2 d_{\text{m}}}{d_e} + 35.7 \right] \tag{2.5.3.4-1}
\]

where \( S_1 = \) push-up length of the rudder stock, \( \text{mm} \);
\( d_{\text{m}} = \) mean diameter of the rudder stock taper, \( \text{mm} \);
\( d_e = \) outer diameter (or minimum outer diameter) of rudder boss or nozzle rudder (in the mean section), \( \text{mm} \);
\( E = \) modulus of elasticity of rudder stock material, \( \text{MPa} \);
\( K = \) taper of conical coupling, on the diameter;
\( q = \) required contact pressure applied to mating surfaces during the push-up, in \( \text{MPa} \), determined from the formula

\[
q = \frac{4.25 \times 10^3 n M_l}{d_e^2 L_w \left[ 1 + \left( \frac{S_1}{d_e} \right)^2 \right]} \left[ 1 + 0.257 \frac{L_w}{d_e M_s} \right] \tag{2.5.3.4-2}
\]

where \( M_l = \) maximum value of design torque according to 2.2.2.3, 2.2.2.4 or 2.2.3.3, \( \text{kN} \cdot \text{m} \);
\( M_s = \) maximum bending moment in way of cone coupling determined according to 2.2.4.8, 2.2.6.3 or 2.2.7.3, \( \text{kN} \cdot \text{m} \);
\( Q = \) mass of rudder or nozzle rudder, kg;
\( L_w = \) actual length of the contact part of taper, excluding the oil distribution grooves and similar devices, \( \text{mm} \);
\( n = \) safety factor against friction slip under the action of rated torque.

The spade rudders and nozzle rudders (types XIV and XV, Fig. 2.2.4.1) the value \( n \) is to be taken not less than 2.5; for other types of rudders and nozzle rudders this value shall be not less than 2.0.

If the contact pressure \( q \) determined from Formula (2.5.3.4-2) is less than 40 \( \text{MPa} \), then \( q = 40 \text{ MPa} \) is to be taken in the calculations.

2.5.3.5 The strength of the maximum loaded part of the coupling shall be checked as follows.

The combined stress on the inside of the rudder boss or nozzle rudder shall not exceed 0.85 of the yield stress of the boss material. The combined stress on the inside of the boss is to be determined from the formula

\[
\sigma_1 = \sqrt{0.5(\sigma_1 - \sigma_2)^2 + 0.5(\sigma_2 - \sigma_3)^2 + 0.5(\sigma_3 - \sigma_1)^2} \tag{2.5.3.5-1}
\]

where \( \sigma = \) combined stress, in \( \text{MPa} \);

\[
\sigma_1 = q \frac{d_2^2 \pm d_1^2}{d_2^2 - d_1^2} \tag{2.5.3.5-2}
\]

\[
q_1 = q + 5.73 \frac{M_s 10^6}{d_2 L_w} \tag{2.5.3.5-3}
\]

\[
\sigma_2 = - q_1 \tag{2.5.3.5-4}
\]

\[
\sigma_3 = \frac{400Q}{\pi(d_2^2 - d_3^2) + \frac{M_s 10^7}{d_3^2}} \tag{2.5.3.5-5}
\]
2.5.3.6 The value of oil pressure applied to the mating tapered surfaces of the stock and boss of the rudder during mounting and dismounting of the coupling shall not exceed $P_{\text{max}}$, determined from the formula:

$$P_{\text{max}} = 0.55 R_{eH} \left[ 1 - \left( \frac{d_2}{R_e} \right)^2 \right]$$  \hspace{1cm} (2.5.3.6)

where $P_{\text{max}}$ is in MPa;

$R_{eH}$ is the yield stress of material for the rudder or nozzle rudder boss, MPa.

2.5.3.7 The design and dimensions of the stock tail and the nut, as well as the means for securing the nut shall be a subject of special consideration by the Register.

2.5.4 Where the rudder stock is not made of a solid piece, its parts are to be joined by means of a muff coupling or by other method which will be specially considered by the Register in each case.

### 2.6 RUDDER PINTLES

2.6.1 The diameter $d_4$, in cm, of pintles without liners, as well as of pintles with liners, but before their setting, is to be not less than determined from the formula

$$d_4 = 18 \sqrt{R_{r} \cdot R_{eH}}$$  \hspace{1cm} (2.6.1)

where $R_{r}$ is the design value of the reaction of the considered pintle ($R_2$ or $R_3$) determined according to the provisions of 2.2.4 and 2.2.5 for the appropriate type of the rudder, kN;

$R_{eH}$ is the upper yield stress of the pintle material, MPa.

2.6.2 The length of the taper part of the pintle in rudder gudgeon, in welded-in bush of the nozzle rudder or in the solpiece is not to be less than the diameter of the pintle according to 2.6.1; the taper on the diameter is not to exceed 1:10. The taper is to change into cylindrical portion without any step in the diameter.

The external diameter of the pintle threaded portion is not to be less than 0.8 times the minimum diameter of the taper. The outer diameter and height of the nut are not to be less than 1.5 and 0.6 times the external diameter of the pintle threaded portion, respectively.

2.6.3 The ratio of bearing height to diameter measured outside the pintle liners, where fitted, is not to be less than 1, nor more than 1.3.

2.6.4 The width of material in the rudder gudgeons and welded-in bushes of the nozzle rudder measured outside the hole for the pintle bush is not to be less than 0.5 times the diameter of the pintle without liner.

For rudder pintles of 200 mm and over in diameter it is allowed to reduce the specified width of the gudgeon from 0.5 times the diameter of the gudgeon down to 0.35 times the diameter of the pintle without liner in case the requirements of 2.6.2 and 2.6.3 are met, the following relation is obtained:

$$\frac{l_7}{d_4} \geq \frac{R_{uH}}{R_{uH_0}}$$  \hspace{1cm} (2.6.4)

where $l_7$ is the height of the pintle bush, cm;

$d_4$ is the diameter of the pintle, cm, including its liner, where fitted;

$R_{uH_0}$ is the upper yield stress of the pintle material, MPa;

$R_{uH}$ is the upper yield stress of the gudgeon material, MPa.

2.6.5 To prevent self-unscrewing, the nut is to be securely fastened by means of at least two weld-on strips or one weld-on strip and a split pin, and the pintles are to be securely fastened in gudgeons of the rudder or sternframe.

2.6.6 The chosen dimensions of the pintles are to be checked by the surface loading $p$, in MPa, this being taken as

$$p = 10 R_u / (d_4 l_7)$$  \hspace{1cm} (2.6.6)

where for $R_u$, see 2.6.1;

$d_4$ is the diameter of the pintle, in cm, including its liner, where fitted;

$l_7$ is the height of the pintle bush, in cm.

This surface loading is not to exceed the values specified in Table 2.1.6. Use of the materials different from those specified in this Table for rubbing parts will be specially considered by the Register in each case.

### 2.7 RUDDER AXLE

2.7.1 The diameter of the rudder axle directly at the flange $d_5$ is to be such that the normal stresses $\sigma$ developed in its sections do not exceed 0.5 times the upper yield stress of the rudder axle material. The normal stress $\sigma$, in MPa, is to be determined from the formula

$$\sigma = 10^5 M_{wax} / d_5^2$$  \hspace{1cm} (2.7.1)

where $M_{wax}$ is the design value of the bending moment determined according to the provisions of 2.2.4.15, kN·m;

$d_5$ is the diameter of the rudder axle at the flange, cm.

The diameter of the rudder axle in way of the rudder bearings is to be not less than the diameter $d_5$. The diameter of the rudder axle between the rudder bearings may be reduced by 10 per cent.

2.7.2 As regards the tapered and threaded portions of the rudder axle and also its nut, the requirements are as stipulated in 2.6.2 for the pintles.
2.7.3 The diameter of bolts of the rudder axle flange coupling $d_b$, in cm, is to be not less than determined from the formula

$$d_b = 6.77 \sqrt[3]{\frac{R_2}{R_a} \frac{M_{r_a}}{75} \left[ 1 + \left( \frac{0.17 + 0.6}{M_{r_a}} \right) \right]}$$

(2.7.3)

where $R_2$ = design value of the reaction of the rudder axle upper bearing determined according to 2.2.4.11, kN; $M_{r_a}$ = design value of the bending moment acting in the rudder axle section near its flange determined according to 2.2.4.15, kNm; $r_4$ = mean distance from the centre of the bolts to the centre of the system of the flange bolt holes, m; $r_5$ = distance from the centre line of the rudder stock to the contact plane of the rudder axle flanges and the sternframe, m; $z_2$ = number of the bolts of the flange coupling; $R_{u_h}$ = upper yield stress of the bolt material, MPa.

The number of the bolts $z_2$ is to be not less than 6. The distance from the centre of any bolt to the centre of the system of the flange bolt holes is to be not less than 0.7, and to the vertical axis of symmetry of the flange plane, not less than 0.6 times the diameter $d_b$ of the rudder axle given in 2.7.1.

2.7.4 Only fitted bolts are to be employed, except the cases of a key setting when it is sufficient to have only two fitted bolts. The nuts shall have standard sizes, and they shall be securely fastened by split pins or weld-on strips.

2.7.5 The thickness of the coupling flange is not to be less than the diameter of the bolts. The centres of the holes for bolts are to be distant from the outside edges of the flange by not less than 1.15 times the diameter of the bolts.

2.7.6 Where the diameter of the rudder axle changes, sufficient fillets are to be provided. At transition from the rudder axle to the flange a fillet shall be provided with a radius of not less than 0.12 times the rudder axle diameter.

2.7.7 To prevent self-unscrewing, the nut of the rudder axle is to be securely fastened at least by two weld-on strips or one weld-on strip and a split pin.

2.7.8 The requirements of 2.6.6 for pintles are applicable to the rudder bearings on the rudder axle.

2.8 RUDDER STOCK BEARINGS

2.8.1 The requirements of 2.6.6 for pintles are applicable to the rudder stock bearings taking lateral load.

2.8.2 A rudder carrier is to be installed to take the mass of the rudder or nozzle rudder and rudder stock. The deck is to be efficiently strengthened in way of the rudder carrier.

Measures are to be taken against axial displacement of the rudder or nozzle rudder and rudder stock upwards by a value exceeding that permitted by the construction of the steering gear; furthermore, for nozzle rudder measures are to be taken to provide for guaranteed clearance between propeller blades and nozzle under service conditions.

2.8.3 A stuffing box is to be fitted in way of passage of the rudder stock through the top of a rudder trunk which is open to sea to prevent water from entering the ship’s space. The stuffing box is to be fitted in a place accessible for inspection and maintenance at all times.

2.9 STEERING GEAR

2.9.1 Ships shall be provided with a main steering gear and an auxiliary steering gear, unless expressly provided otherwise.

2.9.2 The main steering gear shall be capable of putting the rudder or nozzle rudder over from 35° on one side to 35° on the other side, with the ship running ahead at maximum speed corresponding to the draught at which the rudder or nozzle rudder is fully immersed. Under the same conditions the rudder or nozzle rudder shall be capable of being put over from 35° on either side to 30° on the other side in not more than 28 s at the parameters not exceeding the rated values for the gear (see 6.2.1.5, Part IX "Machinery").

2.9.3 The auxiliary steering gear shall be capable of putting the rudder or nozzle rudder over from 15° on one side to 15° on the other side in not more than 60 s, with the ship running ahead at half the maximum speed corresponding to the draught at which the rudder or nozzle rudder is fully immersed or 7 knots, whichever is the greater.

2.9.4 In oil tankers, oil tankers ($>60{\degree}$C), combination carriers, gas carriers and chemical carriers of 10000 tons gross tonnage and upwards, in all nuclear ships and in other ships of 70000 gross tonnage and upwards the main steering gear shall comprise two or more identical power units satisfying the requirements of 2.9.5 (See also 6.2.1.8 and 6.2.1.9, Part IX "Machinery").

2.9.5 Where the main steering gear comprises two or more power units, an auxiliary steering gear need not be fitted if:

1. in passenger and nuclear ships as well as in special purpose ships having more than 200 persons of special personnel on board the main steering gear is capable of operating as required in 2.9.2 while any one of the power units is out of operation;

2. in cargo ships as well as in special purpose ships having 200 or less persons of special personnel on board the main steering gear is capable of operating as required in 2.9.2 while all power units are in operation;
.3 the main steering gear is so arranged that after a single failure in its piping system or in any one of the power units, the defect can be isolated so that steering capability can be maintained or speedily regained.

2.9.6 Where according to 2.3.1 the diameter of the rudder head is required to be over 230 mm, excluding strengthening for navigation in ice, provision is to be made for an additional source of electrical power as prescribed in 5.5.6, Part XI "Electrical Equipment" sufficient to ensure operation of the steering gear power unit in compliance with the requirements of 2.9.3.

2.9.7 The main steering gear may be hand-operated provided it meets the requirements of 6.2.3.2, Part IX "Machinery" and the rudder stock diameter specified in 2.3.1 does not exceed 120 mm (excluding strengthening for navigation in ice).

In all other cases, the main steering gear shall be operated by power.

2.9.8 The auxiliary steering gear may be hand-operated provided it meets the requirements of 6.2.3.3, Part IX "Machinery" and the rudder stock diameter specified in 2.3.1 does not exceed 230 mm (excluding strengthening for navigation in ice).

In all other cases, the auxiliary steering gear shall be operated by power.

2.9.9 The main and auxiliary steering gears shall act on the rudder stock independently of one another, but it is allowed that the main and auxiliary steering gears have some common parts (such as tiller, quadrant, gear box, cylinder block, etc.) provided the respective scantlings of these parts are increased in accordance with 6.2.8.2, Part IX "Machinery".

2.9.10 The rudder tackle may be considered as an auxiliary steering gear only in the following cases:

.1 in self-propelled ships of less than 500 gross tonnage;

.2 in non-propelled ships.

In other cases, the rudder tackle is not considered as a steering gear and is not necessarily to be fitted in ships.

2.9.11 The rudder arrangement shall be provided with a system of stops permitting to put the rudder or nozzle rudder over either side only to an angle \( \beta^\circ \):

\[
(\alpha^\circ + 1^\circ) \leq \beta^\circ \leq (\alpha^\circ + 1.5^\circ)
\]

where \( \alpha^\circ \) = maximum hard-over angle to which the steering control system is adjusted but not over 35\(^\circ\) the greater hard-over angle is subject to special consideration by the Register in each case.

All the parts of the system of stops, including those which are at the same time the parts of the steering gear, are to be calculated to take forces corresponding to an ultimate reverse torque \( M_{adr} \), in kN/m, from the rudder or nozzle rudder of not less than

\[
M_{adr} = 1.135 R_{yld} d_0^2 10^{-4}
\]

where \( d_0 \) = actual diameter of the rudder head, in cm;

\( R_{yld} \) = upper yield stress of the rudder stock material, MPa.

The stresses in these parts shall not exceed 0.95 times the upper yield stress of their material. The rudder stops of the system may be fitted on the sternframe, deck platform, bulkhead or other structural members of the ship's hull.

Where the active rudder is provided and there is a need to put the rudder over to an angle exceeding the maximum one, arrangement of stops is to be specially considered by the Register in each case.

2.9.12 Control of the main steering gear shall be provided both on the navigating bridge and in the steering gear compartment.

2.9.13 When the main steering gear is arranged according to 2.9.4 or 2.9.5, two independent steering gear control systems are to be provided, each of which is to be operable separately from the navigating bridge. These may have a common steering wheel or level. If the control system comprises a hydraulic telemotor, the Register may waive the requirement for a second independent control system of the steering gear for the ship (with the exception of oil tankers, oil tankers (\( > 60^\circ C \)), combination carriers, gas carriers and chemical carriers of 10000 gross tonnage and upwards, of other ships of 70000 gross tonnage and upwards and of nuclear ships).

2.9.14 The auxiliary steering gear control shall be provided in the steering gear compartment.

For the auxiliary steering gear which is power operated, control shall also be provided from the navigating bridge and shall be independent of the control system for the main steering gear.

2.9.15 A rudder angle indicator shall be fitted near each control station of the main and auxiliary steering gears and in the steering gear compartment. The difference between the indicated and actual positions of the rudder shall be not more than:

1\(^\circ\) when the rudder or nozzle rudder is in the centre line or parallel to it;

1,5\(^\circ\) for rudder angles from 0\(^\circ\) to 5\(^\circ\);

2,5\(^\circ\) for rudder angles from 5\(^\circ\) to 35\(^\circ\).

The rudder angle indication shall be independent of the steering gear control system.

2.9.16 In all other respects the steering gear shall meet the requirements of Part IX "Machinery" and Part XI "Electrical Equipment".

2.10 EFFICIENCY OF RUDDERS AND NOZZLE RUDDERS

2.10.1 General provision.

2.10.1.1 The choice of the ship's main characteristics affecting the steerability and the characteristics
of the rudder and nozzle rudder is made at the discretion of the designer and shipowner considering the necessity to ensure the proper steerability of the ship according to its purpose and service conditions and to ensure the correspondence between relative areas of rudders and nozzle rudders of the ship under design and the prototype ship provided the total efficiency of the chosen rudders and/or nozzle rudders is not less than that required in the present Chapter.

2.10.1.2 The requirements of the present Chapter apply to stern rudders and nozzle rudders (see 2.1.2) provided according to 2.1.1 in self-propelled ships (other than icebreakers) of 20 m and over in length of unrestricted service and restricted area of navigation I sailing in the displacement condition. For ships of restricted areas of navigation II and III the standards set forth in 2.10.3 are to be considered as recommendations.

For ships of river-sea navigation II CII and III CII the standards set forth in 2.10.3 are also to be considered as recommendations, and the fulfillment of these standards does not give the grounds for exemption from the fulfillment of the current standards of steerability for ships of inland navigation.

2.10.1.3 The requirements of the present Chapter apply to ships having the geometric characteristics of the hull within the following limits:

\[ L_l/B = 3.2 - 8.0; \quad C_B = 0.45 - 0.85; \]
\[ L_l/d = 8.3 - 28.6; \quad C_p = 0.55 - 0.85; \]
\[ B/d = 1.5 - 3.5; \quad \sigma_{\alpha} = 0.80 - 0.99 \]

where \( B \) = breadth of the ship, in m;
\( C_B, L_l, C_p \) and \( \sigma_{\alpha} \) = see 2.2.2.1, 2.4.1.1 and 2.10.3.3, respectively.

Application of the requirements of the present Chapter to other ships is subject to special agreement with the Register.

2.10.1.4 The requirements of the present Chapter apply to catamarans with two identical hulls (symmetric about the centre plane of the hulls), each having geometric characteristics according to the provisions of 2.10.1.3, and with two identical rudders and/or nozzle rudders arranged in the centre plane of each hull.

2.10.1.5 The active means of the ship’s steering which are not the main means of the ship’s steering (thrusters, active rudders, etc.) are considered as means supplementing the required minimum and are not taken into account when meeting the requirements of the present Chapter (see also 2.1.3.2).

2.10.2 Estimation of efficiency of rudders and nozzle rudders.

2.10.2.1 The efficiency of the chosen rudder \( E_r \), other than rudders of types IV, X and XIII (see Fig. 2.2.4.1), is to be determined from the formula

\[ E_r = \frac{\mu_3 A}{A_2} \left( 1 + C_{HB} A \right) \left( 1 - W \right)^2 \]  \hspace{1cm} (2.10.2.1-1)

where

\[ \mu_3 = \frac{6.28}{1 + \frac{27}{B^2}} \]  \hspace{1cm} (2.10.2.1-2)

\[ W = \text{coefficient; for rudder arranged in the centre plane behind the propeller} \]

\[ W = 0.3 C_B, \]  \hspace{1cm} (2.10.2.1-3)

\[ W = 0, \]  \hspace{1cm} (2.10.2.1-4)

for rudder arranged in the centre plane with no propeller fitted forward of it

\[ W = 0.4 C_B - 0.13; \]  \hspace{1cm} (2.10.2.1-5)

\( A_2 = \) lateral underwater area at the summer waterline draught, in \( \text{m}^2 \);

\( A, A_2, C_B, C_{HB} \) = see 2.2.2.1;

\( C_{HB} \) = value determined from Formula (2.2.3.1-8) with regard to Formula (2.2.3.1-4) at \( W \) as specified in the present sub-paragraph with regard to 2.2.2.6; for rudders not operating directly behind the propeller the thrust is taken as \( T = 0 \).

2.10.2.2 The efficiency of the chosen rudder \( E_r \) of types IV, X or XIII (see Fig. 2.2.4.1) is to be determined from the formula

\[ E_r = 1.3 \mu_3 A \frac{A_2}{A_2} \left( 1 - W \right)^2 \]  \hspace{1cm} (2.10.2.2-1)

where \( \mu_3 = \frac{6.28 \sqrt{E/B}}{1 + \frac{27}{B^2}} + \frac{1.4 C_{HB}}{A_2} \) \hspace{1cm} (2.10.2.2-2)

Here \( b_r = \) breadth of the rudder, m;

\( b_r = \) total breadth of the rudder and rudder post, m;

\( A_2, C_{HB} \) = see 2.2.1.

2.10.2.3 The efficiency of the chosen nozzle rudder \( E_n \) with or without a stabilizer is to be determined from the formula

\[ E_n = 2.86 \mu_3 D_{n/} \frac{A_2}{A_2} \left( 1 - W \right)^2 \]  \hspace{1cm} (2.10.2.3-1)

where

\[ \mu_3 = \left( 0.175 + 0.275 \frac{D_n}{L_n} \right) \left( 1 + 0.25 \left( 1 + \frac{C_{HB}}{A} \right) \right) + 0.25 C_{HB} D_n L_n \]  \hspace{1cm} (2.10.2.3-2)

\( W = \text{coefficient; for nozzle rudder arranged in the centre plane of the ship} \)

\[ W = 0.2 C_{HB}, \]  \hspace{1cm} (2.10.2.3-3)

for side nozzle rudder

\[ W = 0.1 C_{HB}, \]  \hspace{1cm} (2.10.2.3-4)

\( D_n, D_{n/}, L_n, \) and \( A_2 = \) see 2.2.2.1, 2.2.3.1 and 2.10.2.1, respectively;
\[ C_{HB} = \text{value determined from Formula (2.2.3.1-5) with regard to Formula (2.2.3.1-4) at } W \text{ as specified in the present sub-paragraph with regard to 2.2.2.6.} \]

2.10.3 Standards for efficiency of rudders and nozzle rudders.

2.10.3.1 The total efficiency of all rudders and nozzle rudders (see 2.10.2) fitted in the ship (other than catamaran) is not to be less than the greater of the values \( E_1, E_2 \) or \( E_3 \) given below.

2.10.3.2 The efficiency of the single rudder or nozzle rudder fitted in the catamaran which is determined according to 2.10.2 is not to be less than the greater of the values \( E_1, E_2 \) or \( E_3 \) estimated according to the provisions specified below considering each hull of the catamaran as an independent single-screw ship. When determining the lateral windage area, all the above-water structures of the catamaran and the deck cargo (if intended to be carried) are considered as belonging to one hull.

2.10.3.3 For all ships, other than tugs, rescue and fishing vessels, the value of \( E_1 \) is determined depending on the values of \( C_p \) and \( \sigma_a \):

- for single-screw ships — according to Fig. 2.10.3.3-1;
- for twin-screw and triple-screw ships — according to Fig. 2.10.3.3-2.

For intermediate values of \( C_p \) the value of \( E_1 \) is determined by linear interpolation between the curves for two nearest values of \( C_p \) given in Figs 2.10.3.3-1 and 2.10.3.3-2 where \( C_p \) is prismatic coefficient of the underwater part of the hull at the summer waterline draught as determined from the formula

\[ C_p = \frac{C_w}{C_{m}}; \quad (2.10.3.3-1) \]

\( C_m \) = coefficient of fineness of midship section at the summer waterline draught;

\( \sigma_a \) = afterbody lateral area coefficient at the summer waterline draught as determined from the formula

\[ \sigma_a = 1 - \frac{2(f - f_0)}{L_d a}; \quad (2.10.3.3-2) \]

![Fig. 2.10.3.3-1](image1)

![Fig. 2.10.3.3-2](image2)
For tugs, rescue ships and fishing vessels the value $E_1$ is determined according to Fig. 2.10.3.4 depending on the value \( \sigma_p \).

### 2.10.3.5 The value $E_2$ is determined from the formula

\[
E_2 = \frac{3.84A_4}{V^2 A_4} \left( 1 - 0.0667 \frac{A_4}{A_2} \right) \left( 1 + (\lambda_p - 1) \right) 0.33 + 0.015 \times (V - 7.5) - 5 \frac{x_0}{L_1} \quad (2.10.3.5-1)
\]

where
- $A_3$ = lateral windage area at such a minimum draught at which the rudder plate or nozzle rudder is fully immersed (at the upright position of the ship), m², to be determined according to 1.4.6 of Part IV “Stability”;
- $A_4$ = lateral underwater area at such a minimum draught at which the rudder plate or nozzle rudder is fully immersed (at the upright position of the ship), m²;
- $x_0$ = horizontal distance from the midship frame (middle of the length $L_1$) to the centroid of the area $A_3$, m. The value of $x_0$ is taken to be positive in case the centroid is forward of the midship frame, and negative in case of aft position;
- $\lambda_p$ = coefficient determined from the formulæ: 
  - for all rudders, other than rudders of types IV, X and XIII (see Fig. 2.2.4.1)
  - for rudders of types IV, X, XIII (see Fig. 2.2.4.1)

\[
\lambda_p = \frac{h^2}{A}; \quad (2.10.3.5-2)
\]

\[
\lambda_p = \frac{h^2}{A}; \quad (2.10.3.5-3)
\]

\[L_1 = \text{length of the ship measured on the summer load waterline from the fore side of the stem to the after side of the after end of the ship, m;}
\]

\[f = \text{area of side projection of the stern counter, m², calculated as the area of the figure bounded by the extension line of the keel lower edge, by the perpendicular to this line from the point of intersection of the summer load waterline and the outline of the centre plane section of the ship’s after end and by the sternframe after edge line drawn ignoring the rudder post, solepiece or rudder horn, if any;}
\]

\[f_0 = \text{area of side projection of the propeller cone (or its part) superimposed on the area of the figure for the case of endurance zero;}
\]

\[d = \text{see 2.4.1.1.}
\]

### 2.10.3.6 For ships of 70 m in length and more the value $E_3$ is determined from the formula

\[
E_3 = 0.03 + 0.01(\lambda_p - 1) + 0.012 \frac{A_3}{A_2} \left( 1 - \frac{x}{L_1} \right) \quad (2.10.3.6)
\]

where
- $A_3$ = lateral windage area of the ship at the summer waterline draught, m², to be determined according to 1.4.6 of Part IV “Stability”;
- $x$ = horizontal distance from the midship frame (middle of the length $L_1$) to the centroid of the area $A_3$, m. The value of $x$ is taken to be positive in case the centroid is forward of the midship frame and negative in case of aft position.

For ships of less than 70 m in length $E_3 = 0$ is taken in the calculations.

### 2.10.3.7 For all ships (other than rescue and fishing vessels and tugs, with $\sigma_p > 0.865$) it is permitted in the calculations to take $E_1$ as zero (if the value of $E_1$ is greater than any of the values of $E_2$ or $E_3$) provided it is proved by the test of a self-propelled model not less than 2 m in length (at the speed of the model conforming to the ship’s speed $v$, see 2.2.2.1) that:

1. the steady turning diameter of the ship with the rudder (rudders) or nozzle rudder (rudders) put over to 35° on either side is not less than four lengths of the ship;
2. the steady spontaneous turning diameter of the ship with non-reversed rudder (rudders) or nozzle rudder (rudders) $D_s$ calculated from the formula

\[
D_s = (D_{st} + D_{sp})/2 \quad (2.10.3.7)
\]

is not less than 3.35 ($D_{st} + D_{sp}$) where
- $D_{st}$ and $D_{sp}$ = steady turning diameter of the ship with the rudder or nozzle rudder put over to 35° on starboard or port side, respectively;
- $D_s$ and $D_{sp}$ = diameter of steady spontaneous turning starboard or port, respectively, with the non-reversed rudder or nozzle rudder.

If, for technical reasons, the requirement of the present sub-paragraph is not feasible, departure from this requirement is subject to special consideration by the Register.
2.10.3.8 For ships with the displacement exceeding 60000 t and block coefficient exceeding 0.75 at the summer waterline draught, the compliance with the requirements of 2.10.3.7.1 and 2.10.3.7.2 is to be proved by testing a self-propelled model of not less than 2 m in length (at the speed of the model conforming to the ship’s speed v, see 2.2.2.1), notwithstanding the fulfillment of the requirements of 2.10.3.1.

3 ANCHOR ARRANGEMENT

3.1 GENERAL PROVISIONS

3.1.1 Each ship is to be provided with anchor equipment and also with chain stoppers for securing the bower anchors in chain pipes, devices for securing and releasing the inboard ends of the chain cables and machinery for dropping and hoisting the bower anchors as well as for holding the ship at the bower anchors dropped.

Besides, in cases specified in 3.6.1.1 each bower anchor chain cable shall be provided with a stopper for riding the ship at anchor.

3.1.2 If a ship in addition to the anchor arrangement or equipment specified in 3.1.1 is provided with some other anchor arrangement or equipment (for example, special anchors and winches on dredgers, mooring anchors on lightships, etc.), such anchor arrangement or equipment is regarded as special one and is not subject to supervision of the Register. The use of anchor arrangement specified in 3.1.1 as a working special arrangement for moving the dredgers and also for holding the dredgers in place in the course of dredging carried out by grabs is subject to special consideration by the Register in each case; it is necessary to submit to the Register the required data characterizing the conditions of work of anchor arrangement elements (the value and degree of dynamics of acting forces, the degree of intensity of work and wear rate of the anchor arrangement elements, etc.).

3.1.3 For all ships, except fishing vessels, the anchor equipment shall be selected from Table 3.1.3-1, for fishing vessels — from Table 3.1.3-2 according to Equipment Number determined in compliance with 3.2 in the case of ships of unrestricted service and of restricted area of navigation I and according to Equipment Number reduced.

by 15 per cent in the case of ships of restricted areas of navigation II, II CII and III CII;

by 25 per cent in the case of ships of restricted area of navigation III, taking account of the provisions specified in 3.1.4, 3.3.1, 3.3.2, 3.4.1, 3.4.2, 3.4.3, 3.4.7 and 3.4.10.

3.1.4 For non-propelled ships the anchor equipment shall be selected according to Equipment Number increased by 25 per cent as against that calculated in compliance with provisions specified in 3.1.3. For self-propelled ships of unrestricted service, restricted areas of navigation I, II, II CII and III CII having the maximum ahead speed not more than 6 knots at the draught to the summer load waterline and also for ships of restricted area of navigation III having the above speed not more than 5 knots, the anchor equipment shall be selected as in the case of non-propelled ships.

The anchor arrangement of shipborne barges and berth-connected ships should comply with the requirements of Section 3, Part III "Equipment, Arrangements and Outfit" of Rules for the Classification and Construction of Ships of Inland Navigation. For the case of sea passage of berth-connected ships having no permanent anchor arrangement, provision should be made for anchors and anchor chains to be arranged on board.

3.1.5 For remote control systems of the anchor arrangements, if any, the type, extent of automated control and scope of remote control operations are determined by the shipowner.

The additional requirements for the remote-controlled anchor arrangements are given in 3.6.5, the present Part of the Rules, 6.3.6, Part IX "Machinery", and also in 5.2 and 5.6, Part XI "Electrical Equipment".

3.2 EQUIPMENT NUMBER

3.2.1 The Equipment Number $N_e$ for all ships, except floating cranes and tugs, is determined from the formula

$$N_e = A^{2/3} + 2Bh + 0.1A$$  \hspace{1cm} (3.2.1-1)

where $A =$ volume displacement, m$^3$, to the summer load waterline;

$B =$ breadth of the ship, m;

$h =$ height, m, from the summer load waterline to the top of the uppermost deckhouse, which is determined by the formula

$$h = a + \Sigma h_i$$ \hspace{1cm} (3.2.1-2)

where $a =$ distance, m, from the summer load waterline amidships to the top of the upper deck plating at side;

</table>

* Chain cables or wire ropes may be used, chain cable breaking load or actual breaking strength of wire rope being not less than 44 kN.

$h_i$ = height, m, at the centre line of each tier of superstructures or deckhouses having a breadth greater than 0.25B.

In case of ships with two or more superstructures or deckhouses along the length, only one superstructure or deckhouse of the considered tier with the greatest breadth is taken into account.

For the lowest tier $h_1$ to be measured at the centre line from the upper deck or, in case of a stepped upper deck, from a notional line which is a continuation of the upper deck.

When calculating $h$, sheer and trim are to be ignored. See also 3.2.3;

$A$ = area, in m², in profile view of the hull, superstructures and deckhouses above the summer load waterline which are within the ship’s length $L$ and also have a breadth greater than 0.25B (see also 3.2.3).

3.2.2 The Equipment Number $N_e$ for tugs is determined from the formula:

$$N_e = \Delta^{2/3} + 2(Ba + \Sigma h_i) + 0.1 \; A,$$  \hspace{1cm} (3.2.2)

where $\Delta$, $B$, $a$, $h_i$ and $A$ are taken according to 3.2.1;

* Chain cables or wire ropes may be used, chain cable breaking load or actual breaking strength of wire rope being not less than 44 kN.

$h_l = \text{breadth of the appropriate tier of superstructure or deckhouse, m. In case of ships with two or more superstructures or deckhouses along the length, the relevant provisions of 3.2.1 must be followed.}$

3.2.3 Containers or other similar cargoes carried on decks and on hatchway covers, masts, derrick booms, rigging, guard rails and other similar structures may be ignored when determining $h$; when determining the value $A$, the area in profile view of these structures shall be calculated as the area limited by the contour of the structure.

3.2.4 The Equipment Number $N_c$ for floating cranes is determined from the formula

$$N_c = 1.5 A^{2/3} + 2Bh + 2S + 0.1A$$

(3.2.4)

where $A, B, h$ and $A$ are taken according to 3.2.1; when determining the value of $A$, account shall be taken of the area in side profile view of the upper structure of floating crane (stowed for sea) which is calculated as the area.
limited by the outer contour of the structure;  
\[ S = \text{projection on the mid-section of the front area, } m^2, \]
of the upper structure of the floating crane (stowed  
for sea) situated above the deck of the uppermost  
deckhouse taken into account in determination of \( h \),  
the front area being determined, in this case, as the  
area limited by the outer contour of the structure.

3.3 BOWER AND STREAM ANCHORS

3.3.1 If the number of bower anchors determined in  
accordance with provisions of 3.1.3 and 3.1.4 is 3, one of  
them is supposed to be a spare anchor. On agreement  
with the Register, the third (spare) anchor may be stored  
asshore. The third, i.e. the spare anchor, is not required  
for ships of restricted areas of navigation I, II, II CII, III  
CII and III

Ships with Equipment Number of 205 and less  
may have the second bower anchor as a spare one on  
condition that provision is made for its quick getting  
ready for use.

Ships of restricted area of navigation III with  
Equipment Number of 35 and less, if they are not  
passenger ships, may have only one bower anchor.

For ships of restricted area of navigation III a  
stream anchor may be omitted.

On ships assigned to restricted navigation areas  
II CII and III CII and having Equipment Number in  
excess of 205 except the values stated in Table 3.1.3-1,  
provision should be made for a stream anchor with a  
mass equal to at least 75% of a bow anchor mass.

3.3.2 For admiralty stocked anchors the anchor  
mass includes the mass of the stock.

The mass of each bower or stream anchor may differ by  
\( \pm 7 \) per cent from the values determined according to Table  
3.1.3-1 or 3.1.3-2 provided that the total mass of bower  
anchors is not less than the prescribed total mass thereof.

If high holding power anchors are used, the  
mass of each anchor may amount to 75 per  
cent of that determined according to Table 3.1.3-1  
or 3.1.3-2.

3.3.3 Anchors of the following types are permitted  
to be used in ships:

1. Hall’s or Gruson’s anchor (both are stockless);  
2. admiralty anchor (stocked).

The mass of the head of Hall’s or Gruson’s  
anchors including pins and fittings shall be not less  
than 60 per cent of the total anchor mass.

For admiralty stocked anchors the mass of the  
stock shall amount to 20 per cent of the total anchor  
mass including the anchor shackle.

The equipment of ships with anchors of other  
types is subject to special consideration by the  
Register in each case.

In order to recognize the anchor as a high  
holding power anchor, it is necessary to carry out  
comparative tests of this anchor and Hall’s or  
Gruson’s anchor in pair on various types of bottom;  
in this case, the holding power of the anchor shall be  
at least twice as much as that of Hall’s or Gruson’s  
anchor of the same mass.

The scope and procedure of such tests are subject  
to special consideration by the Register in each case.  
As to the rest, the anchors shall satisfy the  
requirements of Section 10.

3.4 CHAIN CABLES ANDropES FOR BOWER ANCHORS

3.4.1 Ship’s with the Equipment Number 205 and  
less, in which the second bower anchor is permitted  
to be a spare one, and also ships with the Equipment  
Number 35 and less and provided according to 3.3.1  
with only one bower anchor may be equipped with  
only one chain cable the length of which is two times  
less than that required in the relevant Equipment  
Table for two chain cables. For ships of restricted  
area of navigation III chain cables or wire ropes for a  
stream anchor may be omitted.

3.4.2 For ships having "supply vessel" notation  
added to the character of classification the total  
length of both chain cables for bower anchors shall  
be taken 165 m greater than the value specified in  
Table 3.1.3-1, and the diameter of these chain cables  
shall be taken not less than that given in Table 3.1.3-1  
two lines below the Equipment Number for the  
considered ship (having regard to the provisions of  
3.1.3 and 3.1.4).

For supply vessels having the Equipment Number  
over 720 at the specification depth of the anchorage  
over 250 m and for those having the Equipment  
Number 720 and less at the specification depth of the  
anchorage over 200 m, the length and diameter of chain  
cables for bower anchors shall be increased taking  
account of the specification depths and conditions of  
the anchorage on agreement with the Register.

3.4.3 For hopper barges and dredgers not having  
hoppers to transport spoil, the diameter of chain cables  
for bower anchors shall be taken not less than that  
specified in Table 3.1.3-1 two lines below the Equipment  
Number of the considered ship, and for dredgers  
having hoppers to transport spoil, one line below  
taking account of the provisions of 3.1.3 and 3.1.4).

3.4.4 Chain cables of bower anchors are to be  
graded dependent on their strength as specified in 3.6,  
Part XIII "Materials".

3.4.5 Tables 3.1.3-1 and 3.1.3-2 specify the  
diameters of chain cables on the assumption that  
the links of these chain cables are provided with  
stakes, with the exception of the chain cables less than  
15 mm in diameter which are assumed to have no  
studs. The use of short link chain cables of increased  
diameter instead of stud link chain cables 15 mm in
diameter and over will be specially considered by the Register in each case.

3.4.6 The chain cables are to be composed of separate chain lengths, except for the chains less than 15 mm in diameter which need not be divided into chain lengths.

The lengths of chains are to be interconnected with joining links. The use of joining shackles instead of joining links is to be specially considered by the Register in each case.

Depending on their location in the chain cable the lengths are divided into:

- anchor length fastened to the anchor;
- intermediate lengths;
- inboard end chain length secured to the chain cable releasing device.

3.4.7 The anchor length of chain shall consist of a swivel, an end link and a minimum quantity of common and enlarged links required to form an independent length of chains.

The anchor length of chains may consist only of a swivel, an end link and a joining link provided the relation between the dimensions of the chain cable parts allows to form such a length. In chain cables which are not divided into lengths of chains the swivel is to be included into each chain cable as near to the anchor as practicable. In all cases, the pins of swivels shall face the middle of the chain cable.

The anchor length is to be connected with the anchor shackle with the aid of an end shackle the pin of which shall be inserted into the anchor shackle.

3.4.8 The intermediate lengths of chains are to be not less than 25 m and not over 27.5 m, the chains consisting of the odd number of links. The total length of two chain cables given in the Equipment Tables is a sum of intermediate lengths of chains only without the anchor and inboard end lengths of chains.

If the number of intermediate lengths of chains is odd, the starboard chain cable shall have one intermediate length of chains more than the port chain cable.

3.4.9 The inboard end length of chains shall consist of a special link of enlarged size (provided, however, that this link is capable of passing freely through the wildcat of the anchor machinery) being secured to the chain cable releasing device, and of minimum number of common and enlarged links required for forming an independent chain length. The inboard end length of chains may consist of one end link only provided the relation between the dimensions of the chain cable parts and the chain cable releasing device allows to form such a length.

3.4.10 In all other respects, the chain cables for bower anchors are to comply with the requirements of 7.1, Part XIII "Materials".

3.4.11 For fishing vessels under 30 m in length and for other ships having the Equipment Number 205 and less the chain cables may be replaced with wire ropes; for fishing vessels between 30 and 40 m in length one of chain cables may be replaced with a wire rope. The actual breaking strength of such ropes is not to be less than the breaking load of the corresponding chain cables, and the length is to be at least 1.5 times the length of the chain cables.

Wire ropes of trawl winches complying with this requirement may be used as anchor cables.

On agreement with the Register, ships having the equipment number 130 and less may be equipped with synthetic fibre ropes instead of chain cables or wire ropes.

3.4.12 The end of each wire rope is to be spliced into a thimble, clamp or socket and connected to the anchor by means of a chain cable section having a length equal to the distance between the anchor (in stowed for sea position) and the anchor machinery or 12.5 m, whichever is the less; a breaking load of the above chain section is to be not less than the actual breaking strength of the wire rope. The chain cable section is to be secured to the wire rope fitting and the anchor shackle by means of joining shackles being equal to the wire ropes in strength.

The length of the chain cable sections may be included into 1.5 times the length of wire ropes specified in 3.4.11.

3.4.13 The wire ropes for anchors are to have at least 114 wires and one natural fibre core. The wires of the ropes are to have a zinc coating according to recognized standards.

In all other respects, the wire ropes for anchors are to meet the requirements of 3.15, Part XIII "Materials".

3.5 CHAIN CABLE OR WIRE ROPE FOR STREAM ANCHOR

3.5.1 Stream-anchor chain cables should meet the applicable requirements of 3.4.

Ships assigned to restricted navigation areas II CII and III CII and having Equipment Number in excess of 205 should be equipped with a stream-anchor chain cable whose length is at least 60% of that required for a bower-anchor chain cable. The chain cable diameter should be taken not less than that mentioned in Table 3.1.3-1 two lines above the Equipment Number of the ship in question (bearing the provisions of 3.1.3 and 3.1.4 in mind).

Ships having Equipment Number below 205 may be equipped with studless chain cables.

3.5.2 The requirements of 3.4.12 and 3.4.13 are applicable to the wire rope for the stream anchor.
3.6 ANCHOR APPLIANCES

3.6.1 Stoppers.

3.6.1.1 Each bower-anchor chain cable or rope and each stream-anchor chain cable having a mass of 200 kg and above is to be provided with a stopper holding the anchor in the hawse pipe when stowed for sea or, in addition, intended for riding the ship at anchor. In ships having no anchor machinery or having the anchor machinery, which is not in compliance with the requirements of 6.3.2.3.2, Part IX "Machinery" provision of stoppers for riding the ship at anchor is obligatory.

3.6.1.2 Where the stoppers is intended only for securing the anchor in the hawse pipe when stowed for sea, its parts are to be calculated to withstand the chain cable strain equal to twice the weight of the anchor, the stresses in the stopper parts not exceeding 0.4 times the upper yield stress of their material. Where the stopper comprises a chain cable or rope, this shall have safety factor 5 in relation to the breaking load of the chain cable or actual breaking strength of the rope under the action of a force equal to twice the weight of the anchor.

3.6.1.3 Where the stopper is intended for riding the ship at anchor, its parts are to be calculated on assumption that the stopper will be subjected to a force in the chain cable equal to 0.8 times its breaking load. The stresses in the stopper parts shall not exceed 0.95 times the upper yield stress of their material. Where the stopper comprises a chain cable or rope, they shall have strength equal to that of the chain cable for which they are intended.

3.6.1.4 In glass-reinforced plastic ships the stoppers shall be fastened by bolts with the use of steel gaskets or wooden pads on the deck and under deck flooring between the framing. Bolt connections shall comply with the requirements of 1.7.4, Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

3.6.2 Device for securing and releasing the inboard end of the chain cable.

3.6.2.1 The parts of the device for securing and releasing the inboard end of the chain cable are to be calculated for strength under the force acting on the device which is equal to 0.6 times the chain breaking load, stresses in these parts not exceeding 0.95 times the upper yield stress of their material.

3.6.2.2 In ships with Equipment Number of more than 205 the device for securing and releasing the inboard end of the chain cable is to be provided with a drive from the deck on which the anchor machinery is fitted or from other deck, in a place which gives quick and ready access at all times. The screw of the drive shall be self-braking.

3.6.2.3 The design of the device for securing and releasing the inboard end of the chain cable shall ensure the efficiency of its operation both under the action of and without the strain of the chain cable referred to in 3.6.2.1.

3.6.2.4 In glass-reinforced plastic ships the device for securing and releasing the inboard end of the chain cable shall be fastened by bolts with the use of steel gaskets on both sides of the bulkhead. Bolt connections shall comply with the requirements of 1.7.4, Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

3.6.3 Laying of chain cables.

3.6.3.1 Laying of chain cables shall provide for their free run when dropping or hoisting the anchors. In ships with a bulbous bow laying of chain cables is to comply with the requirements of 2.8.2.4, Part II "Hull".

3.6.3.2 The anchor shank shall easily enter the hawse pipe under the mere action of the chain cable tension and shall readily take off the hawse pipe when the chain cable is released.

3.6.3.3 The thickness of the hawse pipe is not to be less than 0.4 times the diameter of the chain cable passing through the hawse pipe.

3.6.3.4 In glass-reinforced plastic ships galvanized or stainless steel plates shall be fitted on the outside plating under the hawse pipes; the plates shall be fastened by countersunk bolts. Bolt connections shall comply with the requirements of 1.7.4, Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

3.6.4 Chain lockers.

3.6.4.1 For stowage of each bower anchor chain lockers shall be provided.

When one chain locker is designed for two chains, it shall be provided with an internal division so that separate stowage of each chain is ensured.

3.6.4.2 The chain locker shall be of shape, capacity and depth adequate to provide an easy direct lead of the cables through the chain pipes, an easy self-stowing of the cables and their free veering away when dropping the anchors.

3.6.4.3 The chain locker design and covers of the access openings shall be watertight as necessary to prevent accidental flooding of the chain locker which could damage essential auxiliaries or equipment (located outside the chain locker) or could affect the proper operation of the ship.

3.6.4.4 The chain locker design shall meet the requirements of Part II "Hull"; the drainage facilities with the requirements of 2.11.1, Part VIII "Systems and Piping"; the lighting with the requirements of 6.7, Part XI "Electrical Equipment".

3.6.5 Additional requirements for remote-controlled anchor appliances.

3.6.5.1 Stoppers and other anchor appliances for which remote control is provided (see 3.1.5) shall also be fitted with means of local manual control.
3.6.5.2 The anchor appliances and the associated means of local manual control shall be so designed that normal operation is ensured in case of failure of separate elements or the whole of the remote control system (see also 5.1.3, Part XI "Electrical Equipment").

3.7 ANCHOR MACHINERY

3.7.1 Anchor machinery shall be fitted on the deck in the fore part of the ship for dropping and hoisting the anchors, as well as for holding the ship with the bower anchors dropped if the mass of the anchor exceeds 35 kg.

Ships of restricted area of navigation II CII and III CII shall be fitted with the anchor machinery for dropping and hoisting the stream anchor if its mass exceeds 200 kg.

Ships having Equipment Number 205 and less may be fitted with hand-operated anchor machinery and may also use other deck machinery for dropping and hoisting the anchors.

The requirements for the design and power of anchor machinery are given in 6.3, Part IX "Machinery".

In glass-reinforced plastic ships fastening of the anchor machinery shall comply with the requirements of 3.6.1.4.

3.8 SPARE PARTS

3.8.1 Each ship carrying a spare anchor and equipped with a chain cable (cables) for bower anchor (anchors) accordance with the provisions of 3.3.1 and 3.4 shall have:

- spare anchor length of chain — 1 pc, spare joining link — 2 pcs, spare end shackles — 1 pc.

3.8.2 Each ship equipped with a spare anchor and wire rope (ropes) for bower anchor (anchors) in accordance with the provisions of 3.3.1 and 3.4.11 shall have a spare set of parts for joining the wire rope and anchor shackle.

4 MOORING ARRANGEMENT

4.1 GENERAL PROVISIONS

4.1.1 Each ship is to be supplied with mooring arrangement for warping to coastal or floating berths and for reliable fastening of the ship to them.

For shipborne barges the mooring arrangement is to comply with the requirements of Section 4, Part III "Equipment, Arrangements and Outfit" of the Rules for the Classification and Construction of Ships of Inland Navigation.

4.1.2 For all ships, except fishing vessels, the number, length and actual breaking strength of mooring ropes are to be selected from Table 3.1.3-1, and for fishing vessels — from Table 3.1.3-2 according to Equipment Number determined in compliance with 3.2.

4.1.3 In case the ratio \( A/N_e \) for a ship is more than 0.9, the number of mooring ropes shall be increased as against that prescribed in Table 3.1.3-1 by:

- 1 pc for ships having \( 0.9 < A/N_e \leq 1.1 \);
- 2 pcs for ships having \( 1.1 < A/N_e \leq 1.2 \);
- 3 pcs for ships having \( A/N_e > 1.2 \).

where \( N_e \) and \( A = \) Equipment Number and area in profile view specified in 3.2, respectively.

4.1.4 For individual mooring ropes with breaking strength above 490 kN according to Table 3.1.3-1 the latter may be reduced with corresponding increase of the number of mooring ropes and vice versa, provided that the total breaking strength of all mooring ropes aboard the ship is not less than the value selected from Table 3.1.3-1 with regard to paragraphs 4.1.3 and 4.1.6. The number of ropes shall be not less than 6 and none of the ropes shall have the breaking strength less than 490 kN.

4.1.5 The length of individual mooring ropes may be reduced by up to 7 per cent as against the prescribed value provided that the total length of all mooring ropes is not less than that specified in Table 3.1.3-1 and paragraph 4.1.3 or Table 3.1.3-2.

4.1.6 In case mooring rope made of synthetic fibre material is used, its actual breaking strength \( F_r \), in kN, shall not be less than determined from the formula

\[
F_r = 0.0742 \delta_m F_t^{0.9}
\]

where \( \delta_m = \) elongation at breaking of the synthetic fibre rope, in per cent, but not less than 30 per cent;

\( F_t = \) actual breaking strength of the mooring rope specified in Table 3.1.3-1 or 3.1.3-2, in kN.

4.2 MOORING ROPE

4.2.1 Mooring ropes may be of steel wire, natural fibre or synthetic fibre material, with the exception of the ropes intended for ships carrying in bulk flammable liquids with the flash point 60 °C and below. In these ships the operations with steel wire ropes are allowed only on the superstructure decks which are not the top of liquid cargo tanks and on
condition that no pipelines for loading and unloading the cargo are carried through these decks.

Notwithstanding the breaking strength specified in Table 3.1.3-1 or 3.1.3-2 or determined from Formula (4.1.6), the diameter of the mooring rope made from natural or synthetic fibre material shall not be less than 20 mm.

4.2.2 Steel wire ropes are to have at least 144 wires and not less than 7 fibre cores. The exception is made for wire ropes for automatic mooring winches which may have only one fibre core, but the number of wires in such ropes is to be not less than 216. The wires of the ropes are to have a zinc coating according to recognized standards.

In all other respects, the steel wire ropes are to meet the requirements of 3.15, Part XIII "Materials".

4.2.3 Natural fibre ropes are to be either manilla or sisal. The ships having equipment number 205 and less are permitted to use hemp ropes. The use of hemp ropes in ships with equipment number over 205 is subject to special consideration by the Register in each case.

In all other respects, the natural fibre ropes are to meet the requirements of 6.8, Part XIII "Materials".

4.2.4 The synthetic fibre ropes are to be manufactured from approved homogeneous materials (polypropylene, capron, nylon, etc.). Combinations of synthetic fibres of approved different materials are subject to special consideration by the Register in each case.

In all other respects, the ropes of synthetic fibre material are to meet the requirements of 6.6, Part XIII "Materials".

4.3 MOORING APPLIANCES

4.3.1 The number and position of mooring bollards, fairleads and other mooring appliances depend on the constructional features, purpose and general arrangement of the ship.

4.3.2 Bollards may be of steel or cast iron. Small ships equipped only with natural fibre or synthetic fibre ropes are permitted to use the bollards made of light alloys. As to the method of manufacture, the bollards may be welded or cast.

It is not permitted to use bollards cut directly in the deck which is the top of cargo tanks intended for carriage or stowage of flammable liquids with the flash point 60 °C and below.

4.3.3 The outside diameter of the bollard column is to be not less than 10 diameters of the steel wire rope, not less than 5.5 diameters of the synthetic fibre rope, and not less than one circumference of the natural fibre rope for which the bollard is designed. The distance between the axes of bollard columns is not to be less than 25 diameters of the steel wire rope or 3 circumferences of the natural fibre rope.

4.3.4 Bollards, fairleads and other parts of mooring appliances, with the exception of wire stoppers, as well as their beds are to be so designed that the stresses in the parts do not exceed 0.95 times the upper yield stress of their material when the mooring rope for which they are intended is subjected to the strain equal to the actual breaking strength of the rope.

The breaking load of the wire stopper shall be not less than 0.15 times the actual breaking strength of the whole mooring rope for which it is intended.

In glass-reinforced plastic ships the fastening of bollards, fairleads and other parts of mooring appliances shall comply with the requirements of 3.6.1.4.

4.4 MOORING MACHINERY

4.4.1 Special mooring machinery (mooring capstans, mooring winches, etc.) as well as other deck machinery (windlasses, cargo winches, etc.) fitted with mooring drums may be used for warping the hawser.

4.4.2 The choice of the number and type of mooring machinery is within the owner’s and designer’s discretion, however, the rated pull of the machinery is not to exceed 1/3 of the actual breaking strength of the mooring ropes used in the ship and, besides, the requirements of 6.4, Part IX "Machinery" are to be satisfied.

5 TOWING ARRANGEMENT

5.1 GENERAL PROVISIONS

5.1.1 Each ship is to be provided with towing arrangement which satisfies the requirements of 5.2 and 5.3. Besides, the ships having the notation "(tug)" added to the character of classification are to comply with the requirements of 5.4 to 5.6.

5.1.2 Oil tankers, oil tankers (> 60°C), combination carriers, gas carriers and chemical tankers of 20,000 tons deadweight and over are to comply with the requirements of 5.7.

5.1.3 The towing arrangements of berth-connected ships should comply with the requirements of 5.3, Part III "Equipment, Arrangements and Outfit"
of Rules for the Classification and Construction of Ships of Inland Navigation.

5.2 TOW LINE

5.2.1 The length and the actual breaking strength of the tow line are to be selected from Table 3.1.3-1 according to Equipment Number determined in compliance with 3.2.

For shipborne barges the actual breaking strength of the tow line \( F_b \) in kN, is to be calculated by the formula

\[
F_b = 16nBd
\]

(5.2.1)

where \( n \) = number of barges intended to be towed in the wake of the tug in tandem;

\( B \) = breadth of the barge, m;

\( d \) = draught of the barge, m.

The breaking strength of the tow line is used in the strength calculations of the towing appliances of the shipborne barges. At the discretion of the shipowner the tow lines of the shipborne barges may be stored in the barge carrier or tug, and they do not form a part of the equipment of the shipborne barge.

5.2.2 The tow lines may be of steel wire, natural fibre or synthetic fibre material. The requirements of 4.1.6, 4.2.1 to 4.2.4 for mooring ropes are also applicable to the tow line.

5.3 TOWING APPLIANCES

5.3.1 The number and location of towing bollards and chocks depend on the constructional features, purpose and general arrangement of the ship.

5.3.2 The requirements for mooring bollards and chocks as provided in 4.3.2, 4.3.3 and 4.3.4 are also applicable to towing bollards and chocks.

5.4 SPECIAL ARRANGEMENT FOR TUGS

5.4.1 The number and type of equipment and outfit forming special arrangement for tugs which ensures towing operations under different service conditions are determined by the Shipowner considering that such equipment and outfit shall satisfy the requirements of the present Chapter.

5.4.2 The main determining factor in providing the tugs with a special arrangement is the rated towing pull \( F \) acting on the tow hook. The rated towing pull is to be taken as:

for tugs of unrestricted service and of restricted areas of navigation I and II, the pull on the tow hook required for towing the prescribed tow at a prescribed speed, but not exceeding 5 knots;

for tugs of restricted area of navigation III, the bollard pull, but in no case the rated towing pull \( F \) in kN, is to be taken less than:

\[
F = 0.133P_e
\]

(5.4.2)

where \( P_e \) = total power of the tug's main engines, in kW.

5.4.2.1 The numerical value of the rated towing pull under operating conditions specified in 5.4.2 is within the owner’s and designer’s discretion, and all calculations pertaining to the determination of this value are not subject to approval by the Register. Nevertheless, during mooring and sea trials of the tug, the Register will check this value, and, if the parts of the special arrangement prove to be calculated from a smaller value, the Register may require the strengthening of these parts or may introduce restriction of power during towing operations.

5.4.2.2 The actual breaking strength of the tow line \( F_t \), in kN, for towing operations on the hook is not to be less than:

\[
F_t = kF
\]

(5.4.2.2)

where \( F \) = rated towing pull, in kN, according to 5.4.2;

\( k \) = safety factor equal to:

5.0 for rated towing pull 98.1 kN and less;

3.0 for rated towing pull 294 kN and over.

For intermediate values of the rated towing pull the safety factor \( k \) is obtained by linear interpolation. The length of the tow line for towing operations on the hook is not to be less than 130 m.

The tow line for towing operations on the hook may be of steel wire, natural fibre or synthetic fibre material. The requirements of 4.2 for mooring ropes are also applicable to the tow line for towing operations on the hook.

5.4.3 All stressed parts of the towing arrangement (such as the tow hook, towing rails, etc.) as well as the fastenings for securing these parts to the ship’s hull are to be designed to take the actual breaking load of the tow line. The stresses in these parts are not to exceed 0.95 times the upper yield stress of their material.

5.4.4 The cramp iron of the tow hook is to be calculated as a curvilinear bar. Where such calculations are not carried out, i.e. the formulae for a rectilinear bars are used, permissible stresses are to be reduced by 35 per cent.

5.4.5 All parts of the towing arrangement which are subjected to tension or bending under the hull of the tow line are not to be manufactured of cast iron.

5.4.6 The cramp iron of the tow hook is to be either solid forged or manufactured of a solid rolled blank. Percentage elongation of the cramp iron material is not to be less than 18 per cent on 5D.

5.4.7 Tow hooks are to be of slip-type and have a tow line releasing device operating efficiently in the range of loads on the tow hook from zero to three times the
rated towing pull and at any practically possible
deflection of the tow line from the centre line of the ship.

The device is to be controlled both at the tow
hook and from the navigating bridge. Where the ship
is fitted with a spare tow hook, in addition to the
main one, this hook need not be of slip-type and have
a device for releasing the tow line.

5.4.8 Each tow hook is to be provided with shock
absorbers whose ultimate damping load is not to be
less than 1.3 times the rated towing pull. The tow
hooks for tugs of less than 220 kW of restricted area
of navigation III may have no shock absorbers.

5.4.9 Prior to installation on board the ship the
tow hooks are to be tested by application of a proof
load equal to twice the rated towing pull.

5.4.10 The wire stopper and its fastenings are to
be such that their breaking load is not less than 1.5
times the rated towing pull.

5.4.11 The requirements of 3.7, Part IV "Stabi-
licity" are to be taken into consideration when assign-
ing the position of the tow hook and towing winch.

5.5 TOWING WINCHES

5.5.1 The requirements for the design of towing
winches are specified in 6.5, Part IX "Machinery".

5.5.2 Provision is to be made for operating the
towing winch from a site at the winch; it is
recommended to allow for operating the towing
winch from the navigating bridge.

5.6 TOW LINE FOR TOWING WINCH

5.6.1 The length of tow line for towing winch is
not to be less than 700 m if the power of the tug's
main engines is 2200 kW and over, and at least 500 m
if that power is 1470 kW or less. In the tugs with the
main engines having the power in the range from
1470 to 2200 kW the length of tow line for the towing
winch is to be determined by linear interpolation.

5.6.2 In all other respects, the tow line for towing
winch is to comply with the requirements set forth in
5.4.2.2.

5.7 EMERGENCY TOWING ARRANGEMENTS
ON SHIPS

5.7.1 Ships referred to in 5.1.2 are to be fitted
with emergency towing arrangements forward and aft
of the ship. The arrangements should be capable of
rapid deployment in the absence of main power on
the ship to be towed and easy connection to the
towing vessel.

5.7.2 The components of the emergency towing
arrangement are listed in Table 5.7.2.

<table>
<thead>
<tr>
<th>Components of emergency towing arrangement</th>
<th>Forward of ship</th>
<th>Aft of ship</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pick-up gear</td>
<td>*</td>
<td>Yes</td>

<tr>
<td>Chafing gear</td>
<td>Yes</td>
<td>Depending</td>
</tr>
<tr>
<td>Fairlead</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Strongpoint</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Roller pedestal</td>
<td>Yes</td>
<td>Depending</td>
</tr>
</tbody>
</table>

* Fitting of this component is subject to the special
  consideration of the Register.

5.7.3 Except the pick-up gear and roller pedes-
tal, the components of the emergency towing
arrangement specified in Table 5.7.2 should have a
working strength of at least:

- 1000 kN for ships of 20000 t deadweight and
  over, but less than 50000 t deadweight,
- 2000 kN for ships of 50000 t deadweight and
  over.

Under the above forces, the stresses are not to
exceed 0.5 of the ultimate strength.

The strength should be sufficient for all relevant
angles of towline, i.e. up to 90° from the ship's
centreline to port and starboard and 30° vertically
downwards.

5.7.4 The towing pennant should have a length of
at least twice the lightest seagoing ballast freeboard at
the fairlead plus 50 m.

The towing pennant should have a hard eye-
formed termination allowing connection to a stan-
dard shackle.

The bow and stern strongpoints and fairleads
should be located so as to facilitate towing from
either side of the bow or stern and minimize the stress
on the towing system.

The inboard end fastening should be a stopper or
bracket or other fitting of equivalent strength. The
strongpoint can be designed integral with the fair-
lead.

5.7.5 Fairleads should have an opening large
enough to pass the largest portion of the chafing
gear, towing pennant or towing line.

The fairlead should give adequate support for the
towing pennant during towing operation which
means bending 90° to port and to starboard side and
30° vertically downwards. The bending ratio
(towing pennant bearing surface diameter to towing
pennant diameter) should be not less than 7 to 1.

The fairlead should be located as close as possible
to the deck and, in any case, in such a position that
the chafing chain is approximately parallel to the deck when it is under strain between the strongpoint and the fairlead.

5.7.6 As the chafing gear mentioned in 5.7.2, a chafing chain may be used or another design approved by the Register. The chafing chain should be a stud link chain.

The chafing chain should be long enough to ensure that the towing pennant remains outside the fairlead during the towing operation. A chain extending from the strongpoint to a point at least 3 m beyond the fairlead should meet this criterion.

5.7.7 One end of the chafing chain should be suitable for connection to the strongpoint. The other end should be fitted with a standard pear-shaped open link allowing connection to a standard bow shackle.

The chafing chain should be stowed in such a way that it can be rapidly connected to the strongpoint.

5.7.8 The aft emergency towing arrangement should be capable of being deployed in harbour conditions in not more than 15 min.

The pick-up gear for the aft towing pennant should be designed for manual operation by one person taking into account the absence of power and the potential for adverse environmental conditions that may prevail during such emergency towing operations. The pick-up gear should be protected against the weather and other adverse conditions that may prevail.

5.7.9 The forward emergency towing arrangement should be capable of being deployed in harbour conditions in not more than 1 h. To facilitate connection of the towing pennant to the chafing gear, a suitably positioned pedestal roller may be used.

Forward emergency towing arrangements which comply with the requirements for aft emergency towing arrangements may be accepted.

A typical emergency towing arrangement is shown in Fig. 5.7.9.

5.7.10 All emergency towing arrangements should be clearly marked to facilitate safe and effective use even in darkness and poor visibility.

6 SIGNAL MASTS

6.1 GENERAL PROVISIONS

6.1.1 The requirements given in the present Section refer only to the signal masts, i.e. the masts which are intended for carrying the signal means: navigation lights, day signals, aerials, etc. Where the masts or their parts carry derrick booms or other cargo handling gear in addition to the signal means, such masts or their parts are to comply with the requirements of Rules for the Cargo Handling Gear of Sea-Going Ships.

The requirements of 6.2 — 6.4 do not apply to berth-connected ships. The signal masts of berth-connected ships should be designed to carry prescribed signal means.

6.1.2 Arrangement, height and provision of signal means on the signal masts are to comply with the requirements of Part III "Signal Means" of Rules for the Equipment of Sea-Going Ships.

6.1.3 If in ships of restricted areas of navigation II CII and III CII the signal masts are collapsible, special machinery shall be installed for their operation or provision shall be made for appropriate connection with other deck machinery. The drive of the machinery may be hand-operated provided the machinery is self-braking and the load on the handle is not more than 160 N at any moment of jackknifing or hoisting the mast.
6.2 STAYED MASTS

6.2.1 The outside diameter $d$ and the plate thickness $t$, in mm, at the heel of the masts made of steel having the upper yield stress from 215 up to 255 MPa and stayed by two shrouds on each side of the ship, are not to be less than:

\[ d = 22l, \quad (6.2.1-1) \]

\[ t = 0.2l + 3 \quad (6.2.1-2) \]

where $l$ = mast length, m, from the heel to the shroud eyeplates.

The diameter of the mast may be gradually decreased upwards to a value of $0.75d$ at the shroud eyeplates, while the thickness of the mast plates is maintained constant throughout the length $l$.

The mast length from the shroud eyeplates to the top is not to exceed 1/3 of $l$.

The mast is to be stayed by the shrouds as follows:

.1 horizontal distance $a$, in m, from the deck (or bulwark) stay eyeplate to the transverse plane through the mast stay eyeplate is not to be less than:

\[ a = 0.15h \quad (6.2.1.1) \]

where $h$ = vertical distance, m, from the mast stay eyeplate to the deck (or bulwark) stay eyeplate;

.2 horizontal distance $b$, in m, from the deck (or bulwark) stay eyeplate to the longitudinal plane through the mast stay eyeplate is not to be less than:

\[ b = 0.30h \quad (6.2.1.2) \]

.3 the value $a$ is not to exceed the value $b$.

6.2.2 The actual breaking strength $F$ of the ropes, in kN, used for the mast shrouds as specified in 6.2.1 is not to be less than:

\[ F = 0.49(l^2 + 10l + 25). \quad (6.2.2) \]

In other respects, the ropes for shroud are to comply with the requirements of 3.15, Part XIII "Materials".

The loose gear of shrouds (shackles, turnbuckles, etc.) is to be such that their safe working load is not less than 0.25 times the actual breaking strength of the ropes referred to above.

6.2.3 Where:

- the mast is made of high tensile steel, light alloys, glass-reinforced plastics or wood (the wood shall be of the 1st grade);
- the mast is stayed in a way other than that specified in 6.2.1;
- in addition to a yard arm, lights and day signals, the mast is fitted with other equipment having considerable weight, such as radar reflectors with platforms for their servicing, "crow's nests", etc., proceed as specified in 6.4.

6.2.4 The wires of shrouds are to have a zinc coating according to recognized standards.

6.3 UNSTAYED MASTS

6.3.1 The outside diameter $d$ and the plate thickness $t$, in mm, at the heel of masts made of steel having the upper yield stress from 215 to 255 MPa are not to be less than:

\[ d = 3\left[ (0.674l + a + 13) \times \left( 1 + \sqrt{1 + \frac{51.5 \times 10^6}{F(0.674l + a + 13)^2}} \right)^{1/2} \right]^{1/2}, \quad (6.3.1-1) \]

\[ t = \frac{1}{70} d \quad (6.3.1-2) \]

where $l$ = length of the mast from heel to top, m;

$\alpha$ = elevation of the mast heel above centre of gravity of the ship, m.

The outside diameter of the mast may be gradually decreased upwards to a value 0.5$d$ at the distance 0.75$l$ from the heel.

In no case is the thickness of the mast plate to be less than 4 mm.

The mast heel shall be rigidly fixed in all directions.

6.3.2 Where:

- the mast is made of high tensile steel, light alloys, glass-reinforced plastics or wood (the wood shall be of the 1st grade);
- in addition to a yard arm, lights and day signals, the mast is fitted with other equipment having considerable weight, such as radar reflectors with platforms for their servicing, "crow's nests", etc., proceed as provided in 6.4.

6.4 MASTS OF SPECIAL CONSTRUCTION

6.4.1 In the cases specified in 6.2.3 and 6.3.2 as well as where bipod, tripod and other similar masts are installed, detailed strength calculations of these masts shall be carried out. These calculations are to be submitted to the Register for consideration.

6.4.2 The calculations are to be performed on the assumption that each part of the mast is affected by a horizontal force $F_h$ in kN

\[ F_h = \left[ m, 4\pi^2 \left( \frac{z}{T} + r \sin \theta \right) + m g \sin \theta + p A \cos \theta \right] \times 10^3 \quad (6.4.2) \]

where $m$ = mass of each part, kg;

$z$ = elevation of the centre of gravity of each part above that of the ship, m;

$A$ = projected lateral area of each part, m$^2$;

$T$ = rolling or pitching period, s;

$\theta$ = amplitude of roll or pitch, rad;

$r$ = wave half-height, m;

$g = 9.81 \text{ m/s}^2$ — acceleration due to gravity;

$p = 1960 \text{ Pa} — \text{ specific wind pressure.}$
The calculations are to be carried out both for rolling and pitching of the ship, \( r \) being taken as equal to \( L/40 \) where \( L \) is the ship’s length, \( m \), and \( \theta \), rad., as corresponding to an angle of 40° at roll and of 5° at pitch.

6.4.3 Under the loads specified in 6.4.2, the stresses in the parts of the mast shall not exceed 0.8 times the upper yield stress of their material where they are made of wood. The safety factor of the standing ropes under the same loads is not to be less than 3.

For glass-reinforced plastic masts under the loads specified in 6.4.2 the stresses in the parts of the mast shall not exceed the allowable stress value indicated in Table 3 of Appendix 3 to Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats" for the case of short-time action of the load for the relevant type of deformation.

7 OPENINGS IN HULL, SUPERSTRUCTURES AND DECKHOUSES AND THEIR CLOSING APPLIANCES

7.1 GENERAL PROVISIONS

7.1.1 The requirements of the present Section apply to ships of unrestricted service as well as to ships of restricted areas of navigation I, II, II CII and III CII engaged on international voyages. The requirements for ships of restricted areas of navigation I, II, II CII and III CII not engaged on international voyages, as well as for ships of restricted area of navigation III may be relaxed, the extent of relaxation will be specially considered by the Register in each case, unless expressly provided otherwise.

7.1.2 The requirements of the present Section apply to ships to which a minimum freeboard is assigned. Departures from these requirements may be permitted for the ships to which a greater than minimum freeboard is assigned on condition that the Register is satisfied with safety conditions provided.

7.1.3 The arrangement of openings and their closing appliances in the hull, superstructures and deckhouses is also to comply with the requirements of Part VI "Fire Protection" and Part XI "Electrical Equipment".

7.1.4 As far as deck openings are concerned, the following two positions are distinguished in the present Section:

7.1.4.1 Position 1:

.1 upon exposed parts of superstructure decks and deckhouse tops of the first tier situated abaft 0.25 of the ship’s length \( L \) from the forward perpendicular;

.2 upon the same parts within the superstructures and deckhouses which are not enclosed.

7.1.4.2 Position 2:

.1 upon exposed parts of superstructure decks and deckhouse tops of the first tier situated abaft 0.25 of the ship’s length \( L \) from the forward perpendicular;

.2 upon the same parts within the superstructures and deckhouses of the second tier which are not enclosed.

7.1.5 The height of coamings specified in the present Section is measured from the upper surface of the steel deck plating or from the upper surface of the wood or other sheathing, if fitted.

7.1.6 In supply vessels the access to the spaces situated below the open cargo deck shall preferably be provided from the location inside the enclosed superstructure or deckhouse or from the location above the superstructure deck or deckhouse top. The arrangement of companion or other hatches on the open cargo deck leading to the spaces below this deck is subject to special consideration by the Register in each case, taking account of the degree of protection of these hatches from possible damage during cargo handling operations as well as the volume of spaces flooded in case of damage to the hatch.

7.1.7 The requirements of the present Section for floating docks apply to openings and their closing appliances arranged above the margin line at docking. Openings and their closing appliances arranged below the margin line at docking are subject to special consideration by the Register.

7.1.8 In docklift ships, regardless of the provisions of 7.4 to 7.7, it is not permitted to arrange cargo ports, openings for doors, companion hatches, skylights, ventilating trunks and other hatches in sides and boundary bulkheads of holds if their lower edges are below the margin line at docking, with the exception of the openings to the watertight spaces of a restricted volume not communicating with other spaces below the level of the margin line at docking.
7.1.9 Cargo ports, doors and hatchways in sides and boundary bulkheads of holds in docklift ships, if their sills are above the margin line at docking by less than 600 mm or 0.05 times the distance between the openings and the centre line whichever is the greater, shall be provided with the light signalling system comprising the indicators installed in the control post of the ship’s docking operations. The light indicators shall clearly show the position of the cargo port, door or hatch cover (secured or open).

7.1.10 The light signals specified in 7.1.9 need not be provided for cargo ports, doors and hatchways to the watertight spaces of a restricted volume not communicating with other spaces below the level which is by 600 mm or 0.05 times the distance between the opening and the centre line, whichever is the greater, above the margin line at docking.

7.1.11 In cargo ships covered by the requirements of Part V "Subdivision", the openings for access, piping, ventilation, electric cables, etc. in watertight internal bulkheads and decks should be provided with watertight doors or hatch covers normally closed when at sea which, in their turn, are to be provided with indication means, positioned in their close proximity and on the bridge, to indicate whether such doors or hatch covers are open or closed. On each side of such a door or hatch cover there should be an inscription to the effect the closure is not to be left open.

7.1.12 In ships mentioned under 7.1.11, all external openings which do not, by their location, conform to the requirements of 3.4.4, Part V "Subdivision" should be fitted with strong enough watertight closures for which, except cargo hatch covers, provision should be made for bridge indication.

The watertight closures of shell openings located below the bulkhead deck are to be permanently closed at sea are to be fitted with devices preventing their uncontrolled opening.

Plates should be attached to such closures with inscriptions to the effect the openings must be permanently closed at sea.

7.1.13 In dry cargo ships not covered by the requirements of 7.1.11 and 7.1.12 all the doors of sliding or hinged type in watertight bulkheads should be fitted up with indication means positioned on the bridge to indicate whether such doors are open or closed. Similar indicators should be provided for shell doors and other closing appliances which, if left open or not properly secured, can lead to solid flooding of the ship.

7.1.14 The requirements of Section 7 do not apply to berth-connected ships. For these ships, the following provisions apply:

the coaming height of openings of companion hatches, skylights, ventilation trunks and ventilation heads should not be less than 100 mm;

weathertight hatch covers should be provided;

the external doors of superstructures should be watertight, but where the lower edge of an external door is not less than 600 mm away from the waterline corresponding to the maximum draught, such doors may be weathertight;

the lower edge of a side light is not to be less than 150 mm away from the waterline corresponding to the maximum draught;

on the freeboard deck, the superstructure and deckhouse windows should be watertight.

7.2 SIDE SCUTTLES

7.2.1 Position of side scuttles.

7.2.1.1 The number of side scuttles in the shell plating below the freeboard deck is to be reduced to a minimum compatible with the design and proper working of the ship.

Fishing vessels mooring alongside each other or other ships at sea shall not have side scuttles under freeboard deck in the mooring zone, wherever possible. If in this zone side scuttles are fitted in the shell plating, they shall be so positioned that the possibility of their damage during mooring operations is excluded.

No side scuttles are permitted within the boundaries of the ice belt of the shell plating specified in Part II "Hull" in icebreakers and ships with ice strengthening.

7.2.1.2 No side scuttle is to be fitted in a position so that its sill is below a line drawn parallel to the freeboard deck at side and having its lowest point located 0.025 of the ship’s breadth B or 500 mm, whichever is the greater, above the summer load waterline or above the summer timber load waterline where timber load lines are assigned to the ship.

In ships of restricted areas of navigation II, II CPI, III CPI and III not engaged on international voyages the specified distance 500 mm may be disregarded.

If the length of the ship is less than 24 m, the specified distance may be reduced to 300 mm for ships of restricted areas of navigation II, II CPI and III CPI and to 150 mm for ships of restricted area of navigation III.

7.2.1.3 Side scuttles in the shell plating below the freeboard deck, in front bulkheads of enclosed superstructures and deckhouses of the first tier and also in front bulkheads of enclosed superstructures and deckhouses of the second tier within 0.25L from the forward perpendicular are to be of a heavy type and fitted with efficient deadlights hinged inside (see also 2.4.4, Part VI "Fire Protection").

In tugs of restricted areas of navigation II and III the side scuttles fitted below the bulkhead deck are to be not only of heavy but also of non-opening type.
In ships of restricted areas of navigation II, II CII and III CII having the length below 24 m and in ships of restricted area of navigation III it is allowed to fit side scuttles of normal type instead of those of heavy type.

7.2.1.4 In ships to which the requirements of Part V "Subdivision" apply the side scuttles outside a floodable compartment or a specified group of compartments, fitted in a position so that their sills are by less than 0.3 m or \((0.1 + \frac{L - 10}{150})\) m, whichever is less, above the corresponding damage waterline and the side scuttles in the floating cranes the sills of which are by less than 0.3 m above the waterline corresponding to the actual maximum statical heel in case the hook is under load, shall be not only of heavy but also of non-opening type.

In ships of restricted areas of navigation II, II CII and III CII having the length below 24 m and in ships of restricted area of navigation III it is allowed to fit side scuttles of normal non-opening type instead of those of heavy non-opening type.

7.2.1.5 Side scuttles in enclosed superstructures and deckhouses of the first tier, except those in their front bulkheads, and also side scuttles in enclosed superstructures and deckhouses of the second tier within 0.25 of the ship's length \(L\) from the forward perpendicular, except those in their front bulkheads, may be of normal type.

In ships of restricted areas of navigation II, II CII and III CII having the length below 24 m and in ships of restricted area of navigation III it is allowed to fit side scuttles of normal non-opening type instead of those of heavy non-opening type. Side scuttles are to be fitted with efficient deadlights hinged inside.

7.2.1.6 Side scuttles in enclosed superstructures and deckhouses of the second tier, except those fitted in a position within 0.25 of the ship's length from the forward perpendicular are to be as required in 7.2.1.5. provided these side scuttles give direct access to an open stairway leading to spaces situated below.

In cabins and similar spaces of enclosed superstructures and deckhouses of the second tier it is allowed that instead of side scuttles specified in 7.2.1.5, the side scuttles or windows could be fitted without deadlights.

7.2.1.7 On no account shall the side scuttles be fitted in the outer wall sides of the floating docks and in the sides of the docklift ships so that their sills are below the margin line at docking.

In the inner wall sides of the floating docks and in the boundary bulkheads of the docklift ships installation of the side scuttles is not permitted.

7.2.1.8 In the outer wall sides of the floating docks and in the sides of the docklift ships the side scuttles, the sills of which are above the margin line at docking by less than 300 mm or 0.025 times the ship's breadth, whichever is the greater, shall be of heavy type, fitted with hinged inside deadlights, and of non-opening type.

7.2.1.9 In the outer wall sides of the floating docks the side scuttles, the sills of which are above the margin line at docking by 300 mm or more, shall be of normal type and fitted with hinged inside deadlights.

7.2.1.10 Ships with distinguishing marks III1 and III2 in the class notation are to be fitted with side scuttles having deadlights permanently attached to their primary structure, wheelhouse windows are to be fitted with detachable screens, except side scuttles and windows in the wheelhouse, and search and rescue operation control station.

7.2.2 Construction and attachment of side scuttles and windows.

7.2.2.1 The present Rules distinguish three types of side scuttle construction:

1. heavy type with the glass thickness of not less than 10 mm for inner diameter of 200 mm and below, not less than 15 mm for inner diameter from 300 mm to 350 mm and not less than 19 mm for inner diameter of 400 mm. The inner diameter shall not exceed 400 mm. For intermediate inner diameters (from 200 mm to 300 mm and from 350 mm to 400 mm) the glass thickness is to be determined by linear interpolation.

In addition, heavy side scuttles if they are of the opening type are to have a nut (instead of one of the ear-nuts securing their frame) being screwed off with the aid of a special wrench;

2. normal type with the glass thickness of not less than 8 mm for inner diameter of 250 mm and below, and not less than 12 mm for inner diameter of 350 mm and over, however, the inner diameter is not to exceed 400 mm. For intermediate inner diameters the thickness of the glass is to be determined by linear interpolation;

3. light type with the glass thickness of not less than 6 mm for inner diameter of 250 mm and below and not less than 10 mm for inner diameter of 400 mm and over, however, the inner diameter is not to exceed 450 mm. For intermediate inner diameters the thickness of the glass is to be determined by linear interpolation.

7.2.2.2 Normal and heavy side scuttles may be of non-opening type, i.e. with the glass fixed in the main frame, or of opening type, i.e. with the glass fixed in the glazing bead efficiently hinged on the main frame. Exception is to be made for the cases specified in 7.2.1.3, 7.2.1.4 and 7.2.1.8 where the side scuttles shall be of non-opening type only.

The glasses of side scuttles are to be reliably and weathertight secured by means of a metal ring provided with screws or by other equivalent device and a gasket.
7.2.2.3 The main frame, glazing bead and deadlight of side scuttles are to have sufficient strength. The glazing bead and deadlight are to be fitted with gaskets and shall be capable of being effectively closed and secured weathertight by means of ear-nuts or nuts being screwed off with the aid of a special wrench.

7.2.2.4 The main frame, glazing bead, deadlight and ring for securing the glass are to be manufactured from steel, brass or other material approved by the Register.

The ear-nuts and nuts being screwed off by a special wrench are to be made of corrosion-resistant material.

7.2.2.5 In glass-reinforced plastic ships side scuttles shall be attached to the outside plating and to the bulkheads of superstructures and deckhouses in accordance with the requirements of 1.7.4, Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

7.2.2.6 The construction of the windows shall comply with the requirements of 7.2.2.2, 7.2.2.3 and 7.2.2.4, except for the requirements for the deadlights.

The thickness of the window glass, \( t \), in mm, shall be not less than determined from the formula

\[
t = 0.32kb\sqrt{p} \quad (7.2.2.6-1)
\]

where
- \( b \) = lesser clear size of the window, m;
- \( p \) = pressure head, kPa, calculated according to 2.12.3, Part II "Hull";
- \( z_1 \) = distance \( z_1 \) being taken up to the middle of the window height;
- \( k \) = factor determined from the formula

\[
k = 13.42 - 5.125(b/a)^2 \quad (7.2.2.6-2)
\]
- \( a \) = greater clear size of the window, m.

7.3 FLUSH DECK SCUTTLES

7.3.1 Flush deck scuttles in positions 1 and 2 are to be provided with deadlights hinged or attached by other method (for example, by means of a chain) and capable of being easily and efficiently closed and secured.

7.3.2 The largest of clear dimensions of the flush deck scuttles is not to be over 200 mm, with the glass being at least 15 mm thick. The flush deck scuttles shall be attached to the metal deck plating by means of frames.

7.3.3 When secured, the deadlights of the flush deck scuttles are to be weathertight. The tightness is to be ensured by a rubber or other suitable gasket.

For the same purpose, along their contour the glasses of the flush deck scuttles are to be provided with a gasket made of rubber or other suitable material.

7.3.4 The strength and materials of the flush deck scuttles parts are governed by applicable requirements specified in 7.2.2.3 and 7.2.2.4. As regards attachment of flush deck scuttles in glass-reinforced plastic ships, see requirements of 7.2.2.5.

7.4 OPENINGS IN SHELL PLATING AND THEIR CLOSING APPLIANCES

7.4.1 General.

7.4.1.1 This Chapter gives requirements for the arrangement of bow, side and stern doors in the shell plating, strength of structural elements of the doors, securing, locking and supporting devices.

7.4.1.2 The number of doors is to be reduced to a minimum consistent with the structure and normal operational conditions of the ship.

7.4.1.3 When closed and secured, doors in the shell plating are to be weathertight. Weathertightness is to be ensured with a rubber or other suitable packing.

7.4.1.4 The plating thickness of the doors made of steel, irrespective of the fulfilment of the requirements given in 7.4.1.10, is to be not less than the thicknesses referred to in 2.2.4.8 and 2.12.4.1, Part II "Hull" for the appropriate position of the door; the minimum plating thickness of the doors made of other materials is subject to special consideration by the Register in each particular case.

7.4.1.5 Doors with a clear area of 12 m² and more are to be secured by means of a power system or by a hand gear used for securing the door from a readily accessible position.

7.4.1.6 When power-operated securing devices or devices with a hand gear are used, it is necessary to ensure that the doors should remain tight in the secured position and should remain secured in case of failure of any part of the power system or hand gear of the securing device.

Hydraulically operated securing devices are to be manually or mechanically lockable in the secured position.

7.4.1.7 When power-operated securing devices or devices with a hand gear are used, provision is to be made for the indicators which clearly show whether the door is totally secured or not.

These indicators are to be fitted in a position from which the securing operation is performed, and in case of the power-operated securing device, also on the navigating bridge.

7.4.1.8 If, due to the ship’s purpose, it is specially provided to open and close the doors not only in ports but also at sea, arrangements approved by the Register are to be made (with regard to the operational conditions) to ensure closure and com-
plete securing of the open door, even in case of failure of the door gear and securing device gear, or other arrangements approved by the Register are to be made to prevent penetration of water into the ship spaces when the door is open.

Provision is to be made for devices ensuring proper locking of the door in the open position.

The drives of such doors are to comply with the requirements of Part IX "Machinery" and Part XI "Electrical Equipment".

7.4.1.9 There must be a readily seen notice plate near each door, indicating that the door is to be closed and secured before the ship leaves the port; for doors referred to in 7.4.1.8 provision is to be also made for a notice plate indicating that at sea only the Master is allowed to open the door.

7.4.1.10 When doors are under the action of the design loads determined in accordance with 7.4.2 and 7.4.3, except 7.4.2.5, stresses, in MPa, in the primary members of the doors as well as of securing, locking and supporting devices are not to exceed the following values:

- bending stress:
  \[ \sigma = 120/k, \]
- shear stress:
  \[ \tau = 80/k, \]
- equivalent stress:
  \[ \sigma_e = \sqrt{\sigma^2 + 3\tau^2} = 150/k \]

where \( k = 1.0 \) for steel with upper yield stress of the material \( R_{yh} = 235 \) MPa;
\( k = 0.78 \) for steel with \( R_{yh} = 315 \) MPa;
\( k = 0.72 \) for steel with \( R_{yh} = 335 \) MPa.

7.4.2 Bow doors.

7.4.2.1 Bow doors are to be situated above the freeboard deck.

7.4.2.2 Where the bow door leads to a complete or long forward enclosed superstructure a weather-tight inner door is to be installed as part of the collision bulkhead above the freeboard deck of the ship.

Bow and inner doors are to be so arranged as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in case of damage to or detachment of the bow door.

7.4.2.3 The design external pressure \( P_e \), in kPa, for the scantlings of primary members, securing, locking and supporting devices of the bow doors is determined from the following formula:

\[ P_e = C_H(0.6 + 0.41tgz)(0.4\sin\beta + 0.6\sqrt{L})^2 \]  
(7.4.2.3)

where \( C_H \) is a coefficient equal to:

\[ C_H = 0.0125L \text{ for ships less than } 80 \text{ m in length}; \]
\[ C_H = 1.0 \text{ for ships } 80 \text{ m and more in length}; \]
\( v \) = contractual ship's forward speed, in knots;
\( \alpha \) and \( \beta \) = angles to be obtained from Fig. 7.4.2.3.

\[ P_e = 10z \]

where \( z \) = vertical distance from the centre of gravity of the door area to the deck above, in m.

In all cases, the value of the design internal pressure \( P_i \) is not to be less than 25 kPa.

7.4.2.5 The scantlings of primary members of visor doors are to be chosen in accordance with the requirements of 2.8.5.1, Part II "Hull".

7.4.2.6 Securing and locking devices of bow doors are to be designed to withstand the forces \( F_e \) or \( F_s \), in kN, to be obtained from the following formulae:

- for the doors opening inwards:
  \[ F_e = AP_e + p_p l_p \]  
(7.4.2.6-1)
- for the doors opening outwards:
  \[ F_e = AP_i + 10Q + p_p l_p \]  
(7.4.2.6-2)

where \( A = \) clear area of the door, \( m^2 \);
for \( P_e \), see 7.4.2.3;
for \( P_i \), see 7.4.2.4;
\( p_p \) = pressure of the packing when it is compressed for the maximum depth possible, kN/m, is assumed in calculations equal to at least 5 kN/m;
\( l_p \) = length of the packing, m;
\( Q \) = mass of the door, t.
7.4.2.7 Securing and locking devices, as well as supports of the visor doors are to be designed to withstand forces \( F_{sy}, F_{sa}, F_s \) and \( F_s \), in kN.

The forces acting in the longitudinal direction are to be determined from the following formulae:

\[
F_{sx} = \frac{10QC + P_{sa}a - P_s b}{d} \quad (7.4.2.7-1)
\]

\[
F_{sa} = \frac{10QC - P_{sa}a}{d} \quad (7.4.2.7-2)
\]

The force acting in the transverse direction is to be determined from the formula:

\[
F_y = P_s A_y \quad (7.4.2.7-3)
\]

The force acting in the vertical direction is to be determined from the formula:

\[
F_v = P_s - 10Q \quad (7.4.2.7-4)
\]

or

\[
F_v = 10(V - Q) \quad (7.4.2.7-5)
\]

wherever is the greater.

where for \( Q \) see 7.4.2.6;
for \( P_s \) see 7.4.2.3;
\( A_y = \) area of the longitudinal vertical projection of the door (see Fig. 7.4.2.7), in m²;
\( P_s = P_a A_y \), kN;
\( A_s = \) area of horizontal projection of the door (see Fig. 7.4.2.7), in m²;
\( P_s = P_a A_s \), kN;
for \( P_a \) see 7.4.2.4;

\[\begin{align*}
A_y & = \text{area of the longitudinal vertical projection of the door} \\
(a & = \text{vertical distance, in m, from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in Fig. 7.4.2.7}) \\
b & = \text{vertical distance, in m, from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in Fig. 7.4.2.7} \\
c & = \text{horizontal distance, in m, from visor pivot to the centre of gravity of the visor mass, as shown in Fig. 7.4.2.7} \\
d & = \text{vertical distance, in m, from visor pivot to the bottom of the door, as shown in Fig. 7.4.2.7} \\
V & = \text{inner volume of the door, in m³}
\end{align*}\]

7.4.2.8 For side-opening doors, thrust bearing is to be provided in way of girder ends at the closing of two leaves to prevent one leaf shifting towards the other one under effect of unsymmetrical pressure (see Fig. 7.4.2.8). Each part of the thrust bearing is to be kept secured on the other part by means of securing devices.

7.4.2.9 Lifting arms of the visor doors and thrust bearing are to be designed to withstand static and dynamic loads arising when the door is opened and closed with due regard to the minimum wind pressure 1.5 kN/m².

7.4.3 Side and stern doors.

7.4.3.1 The lower edge of the door openings is not to be lower than the line which is parallel to the freeboard deck and has its lowest point at the uppermost cargo waterline.

The deviation from this requirement may be allowed in exceptional cases for side doors of the ships which are not passenger ships, provided it is proved to the Register that safety will not be thus impaired.

In such cases, provision is to be made for: the second (inner) doors, strength and tightness of which is equivalent to those of the outer doors; a device enabling to determine water presence in the space between the doors; water drainage from this space to
bilges or drain wells, controlled by a readily accessible valve or other arrangements approved by the Register.

7.4.3.2 The doors are to be open outwards so that forces acting under the effect of the sea press the door against the supporting contour of the sill. Installation of the doors opening inside is subject to special consideration by the Register in each particular case.

7.4.3.3 The number of securing devices on each edge of the door is to be not less than two; a securing device is to be provided in the vicinity of each door corner. The distance between securing devices is not to exceed 2.5 m.

7.4.3.4 The design external pressure \( P \), in kPa, for structural members of doors is to be determined in accordance with the requirements of 1.3.2, Part II "Hull". In any case, the value of \( P \) is not to be taken less than 25 kPa.

7.4.3.5 Securing and locking devices are to be designed to withstand the forces \( F_1 \) or \( F_2 \), kN, determined from the formulae:

\[
F_1 = AP + p_d \rho_p \tag{7.4.3.4-1}
\]

for doors opening inwards;

\[
F_2 = F_e + 10Q + p_d \rho_p \tag{7.4.3.4-2}
\]

where for \( A, \rho_p \), and \( \rho_p \), see 7.4.2.6;

for \( P \), see 7.4.3.4

\( F_e \) = an accidental force due to loose cargo, to be uniformly distributed over the area \( A \) and to be taken not less than 300 kN or 5\( A \), in kN, whichever is the greater.

For small doors, such as bunker doors or pilot doors, the value of \( F_e \) may be reduced upon special consideration by the Register. In case the second (inner) door is installed, which is capable to protect the external door from accidental forces due to loose cargoes, \( F_e = 0 \).

For \( Q \), see 7.4.2.6.

Supporting structures of doors are to be designed to withstand forces \( F_3 \) and \( F_4 \), in kN, obtained from the formulae:

for doors opening inwards:

\[
F_3 = AP \tag{7.4.3.4-3}
\]

for doors opening outwards:

\[
F_4 = F_e + 10Q \tag{7.4.3.4-4}.
\]

7.5 SUPERSTRUCTURES AND DECKHOUSES

7.5.1 Construction, openings and closing appliances.

7.5.1.1 Openings in the freeboard deck other than those defined in 7.3, 7.6 to 7.11 and 7.13 are to be protected by the enclosed superstructure or enclosed deckhouse.

The similar openings in the deck of enclosed superstructure or enclosed deckhouse are to be protected by enclosed deckhouse of the second tier.

7.5.1.2 Superstructures and deckhouses are considered enclosed if:

- their construction complies with the requirements of 2.12, Part II "Hull";
- all access openings comply with the requirements of 7.5.2 and 7.7;
- all other openings in their outside contour comply with requirements of 7.2 to 7.4 and 7.7 to 7.10.

7.5.2 Doors in enclosed superstructures and enclosed deckhouses.

7.5.2.1 All access openings in the end bulkheads of enclosed superstructures and outside bulkheads of enclosed deckhouses are to be fitted with doors (see 2.4.5, Part VI "Fire Protection").

7.5.2.2 The height of the sills to access openings specified in 7.5.2.1 is to be at least 380 mm. However, the bridge or poop shall not be regarded as enclosed unless access is provided for the crew to machinery and other working spaces inside these superstructures from any place in the uppermost continuous open deck or above it by alternative means which are available at all times when bulkhead openings are closed; the height of the sills of the openings in the bulkheads of such bridge or poop is to be at least 600 mm in position 1 and at least 380 mm in position 2.

In ships of restricted area of navigation III having the length of 24 m and over (except for passenger ships) the specified height of the sills to access openings may be reduced from 600 mm down to 450 mm and from 380 mm down to 230 mm, respectively.

In ships of restricted areas of navigation II, II CII, III CII and III having the length below 24 m the height of the above sills may be reduced to 230 mm for all open decks.

7.5.2.3 The doors shall be so designed as to withstand the pressure head \( p \) calculated according to 2.12.3, Part II "Hull", the distance \( z_1 \) being taken up to the middle of the door height. Under the pressure head \( p \) the stresses in the door elements shall not exceed 0.8 times the upper yield stress of the material.

Whatever the stresses, the thickness of the steel door plate shall be not less than that specified in 2.12.4.4, Part II "Hull". For steel doors manufactured by stamping the minimum thickness of the door plate may be reduced by 1 mm.

The minimum thickness of the door plate made of other materials is subject to special consideration by the Register.

7.5.2.4 The doors are to be permanently and strongly attached to the bulkhead and fitted with clamping devices or other equivalent means for expeditiously opening, closing and securing them.
weathertight; such devices shall be so arranged that they can be operated from both sides of the bulkhead. The doors are to be opening outside, opening of doors inside the superstructure or deckhouse space will be specially considered by the Register in each case.

7.5.2.5 The doors are to be weathertight when secured. The tightness is to be ensured by a rubber or other suitable gasket.

7.5.2.6 The doors are to be made of steel or other material approved by the Register.

7.5.2.7 In glass-reinforced plastic ships the doors shall be attached to the bulkheads of superstructures and deckhouses in the same manner as the side scuttles, in accordance with the requirements of 7.2.3.5.

7.5.2.8 In floating docks the height of the sills to access openings in superstructures and deckhouses of the top deck shall be at least 200 mm if access is provided from these superstructures and deckhouses into the spaces situated below.

7.6 ENGINE AND BOILER CASINGS

7.6.1 Engine and boiler space openings in positions 1 and 2 are to be efficiently enclosed by casings of ample strength raised above decks to the extent, which is reasonable and practicable, and being in their turn decked or terminated in skylights. The construction of the casings is to meet the requirements of 2.13, Part II "Hull", and in case of glass-reinforced plastic ships, with the requirements of Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

7.6.2 Casings are to be made weathertight.

7.6.3 Casings are to be made of steel or other materials approved by the Register (see also 2.1.1.2, Part VI "Fire Protection").

7.6.4 The access openings in the casings are to be fitted with permanently attached doors complying with the requirements of 7.5.2.3 to 7.5.2.6. The height of the sills to the access openings is to be at least 600 mm in position 1 and at least 380 mm in position 2.

If the length of the ship is less than 24 m, the specified height of the sills may be reduced down to 300 mm for ships of restricted areas of navigation II, II CI, III CI and III.

In ships of restricted area of navigation III having the length of 24 m and over (except passenger ships) the specified height of the sills may be reduced from 600 mm down to 450 mm and from 380 mm down to 230 mm, respectively.

7.6.5 In type "A" ships and also in type "B" ships which are permitted to have the tabular freeboard less than that prescribed by Table 4.1.3.2, 6.4.2.3 or 6.4.3.3 of the Load Line Rules for Sea-Going Ships, the engine and boiler casings are to be protected by enclosed poop or bridge of at least standard height, or by a deckhouse of equal height and equivalent strength. However, engine and boiler casings may be exposed if there are no openings giving direct access from the freeboard deck to the machinery space. A door complying with requirements of 7.5.2.3 to 7.5.2.6 may, however, be permitted in the machinery casing provided that it leads to a space or passageway which is as strongly constructed as the casing and is separated from the stairway to the engine and boiler room by a second similar door. The opening for the outside door is to be provided with a sill at least 600 mm in height, and that for the inside door with a sill of at least 230 mm in height.

7.6.6 In supply vessels the doors in the casings giving access to the engine or boiler rooms shall be located, where possible, inside the enclosed superstructure or deckhouse.

The door in the casing for access to the engine or boiler room may be fitted directly on the open cargo deck provided that, in addition to the first outside door, the second inside door is fitted; in this case, the outside and inside doors shall satisfy the requirements of 7.5.2.3 to 7.5.2.6, the height of the outside door sill shall be at least 600 mm, and of the inside door sill, at least 230 mm.

7.6.7 In floating docks the height of sills to the top deck access openings in the engine and boiler casings shall be at least 200 mm.

7.7 COMPANION HATCHES, SKYLIGHTS AND VENTILATING TRUNKS

7.7.1 Deck openings in positions 1 and 2 intended for stairways to the ship’s spaces located below, as well as light and air openings to these spaces are to be protected by strong companion hatches, skylights or ventilating trunks.

Where the openings intended for stairways to the ship’s spaces located below are protected by superstructures or deckhouses instead of companion hatches, these superstructures and deckhouses shall comply with the requirements of 7.5.

7.7.2 Height of coamings of companion hatches, skylights and ventilating trunks is to be at least 600 mm in position 1 and at least 450 mm in position 2.

In ships of restricted area of navigation III having the length of 24 m and over (except passenger ships) the specified height of coamings may be reduced from 600 mm down to 450 mm and from 450 mm down to 380 mm, respectively. If the length of the ship is less than 24 m, the height of the coamings may be reduced down to 380 mm for ships of restricted areas of navigation II, II CI and III CI and down to 300 mm for ships of restricted area of navigation III.
Construction of coamings is to comply with the requirements of 2.6.5.2. Part II "Hull" and in case of glass-reinforced plastic ships, with the requirements of Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

7.7.3 All the companion hatches, skylights and ventilating trunks are to be provided with covers made of steel or other material approved by the Register and being permanently attached to the coamings.

Where the covers are made of steel, the thickness of their plate is to be equal to at least 0,01 times the spacing of stiffeners, but not less than 6 mm.

The minimum required thickness of 6 mm may be reduced if the cover is made by stamping in accordance with Fig. 7.7.3 and Table 7.7.3.

In small ships having the deck thickness less than 6 mm the required minimum thickness 6 mm may be reduced down to the deck thickness regardless of whether the cover is made by stamping, but in no case is the plate thickness to be less than 4 mm.

7.7.4 Covers of companion hatches, skylights and ventilating trunks are to have securing devices workable at least from outside of the hatch. However, where the hatches are used as emergency exits in addition to their primary application, the securing device is to be capable of being operated from each side of the cover.

When secured, the covers are to be weathertight. The tightness is to be provided by a rubber or other suitable gasket.

7.7.5 The glass for windows in the covers of skylights is to be hardened and at least 6 mm thick if the inner diameter is 150 mm and below, and at least 12 mm with the inner diameter of 450 mm. For intermediate inner diameters, the thickness of glass is to be determined by linear interpolation. However, where wire-reinforced glass is used, its thickness may be 5 mm, and the requirement relating to its hardening will not be applicable.

Glass is to be efficiently attached to the covers by means of a frame and have on its contour a weathertight gasket of rubber or other equivalent material.

Windows in the covers of skylights fitted in machinery spaces shall comply with the requirements of 2.1.4.2, Part VI "Fire Protection".

7.7.6 Each window or group of adjacent windows is to be provided with portable shields of the same material as the cover being at least 3 mm in thickness and capable of being efficiently fastened outside the cover by means of ear-nuts; such portable shields are to be stowed adjacent to the skylights.

7.7.7 In floating docks the height of coamings of companion hatches, skylights and ventilating trunks situated on the top deck shall be at least 200 mm.

The portable shields mentioned in 7.7.6 need not be provided for covers of skylights situated on the top deck of the floating docks.

7.8 VENTILATORS

7.8.1 Ventilators to spaces below freeboard deck or deck of enclosed superstructures and deckhouses are to be fitted with coamings efficiently connected to the deck. The coamings of ventilators are to be at least 900 mm in height in position 1 and at least 760 mm in position 2.

In ships of restricted area of navigation III having the length of 24 m and over (except passenger ships) the specified height of the coamings may be reduced from 900 mm down to 760 mm and from 760 mm down to 600 mm, respectively.
In ships of restricted areas of navigation II, II CII, III CII and III having the length below 24 m the height of the coamings may be reduced down to 300 mm for all open decks.

Construction of coamings is to comply with the requirements of 2.6.5.2. Part II "Hull" and in case of glass-reinforced plastic ships, with the requirements of Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

The strength of ventilators, connections of ventilators to coamings and connections of ventilator parts, if any, shall be equivalent to that of the coaming.

7.8.2 Ventilators in position 1 the coamings of which extend to more than 4500 mm above the deck and in position 2 the coamings of which extend to more than 2300 mm above the deck need not be fitted with closing appliances. In all other cases, each ventilator is to be fitted with a strong cover made of steel or other material approved by the Register.

In ships of less than 200 m in length, the covers are to be permanently attached; in ships of 100 m in length and over they may be conveniently stowed near the ventilators to which they are to be fitted.

7.8.3 When secured, the covers of ventilators are to be weathertight. The tightness is to be provided by a rubber or other suitable gasket.

7.8.4 In supply vessels, in order to minimize the possibility of flooding of the spaces situated below, the ventilators shall be positioned in the protected locations where the probability of their damage by cargo is excluded during cargo handling operations. Particular attention shall be given to the arrangement of ventilators of the engine and boiler rooms for which the location is preferable above the deck level of the first tier of superstructures or deckhouses.

7.8.5 In floating docks the height of coamings of ventilators situated on the top deck shall be at least 200 mm.

7.9 MANHOLES

7.9.1 The height of coamings of manholes for deep and other tanks, except for those indicated in 2.4.5.3, Part II "Hull", air spaces, cofferdams, etc. will not be regulated by the Register.

7.9.2 Covers of manholes are to be made of steel or other material approved by the Register.

The thickness of the covers is not to be less than that of the plating on which they are fitted. In sound cases, the Register may permit to decrease the thickness of the covers where the thickness of plating is greater than 12 mm.

7.9.3 The covers of manholes are to be efficiently attached to the coaming or doubling ring by means of bolts or pins with nuts.

7.9.4 When secured, the covers are to be tight both for water and liquid cargoes or stores for which the tanks are intended under the inner pressure corresponding to the test pressure of the tank under consideration.

The tightness is to be provided by a rubber or other suitable gasket. The gasket is to be resistant to the liquids referred to above.

7.10 HATCHWAYS OF DRY CARGO HOLDS

7.10.1 General.

The deck openings through which cargoes or ship's stores are loaded and unloaded are to be protected by strong hatchways. If these hatchways are situated in positions 1 and 2, the hatchway covers are to be weathertight. The tightness is to be provided by one of the following two methods:

.1 by portable covers and tarpaulins as well as battening devices;

.2 by weathertight covers made of steel or other equivalent material fitted with rubber or other suitable gaskets and clamping devices.

7.10.2 Coamings.

7.10.2.1 The height of hatchway coamings in positions 1 and 2 is to be at least 600 mm and 450 mm, respectively.

If the length of the ship is less than 24 m, the height of the coamings may be reduced down to 380 mm for ships of restricted area of navigation II, II CII and III CII and down to 300 mm for ships of restricted area of navigation III. In fishing vessels the height of cargo hatchway coamings in position 2 may be reduced down to 300 mm.

In ships of restricted area of navigation III having the length of 24 m and over (except passenger ships) the specified height of cargo hatchway coamings may be reduced from 600 mm down to 450 mm and from 450 mm down to 380 mm, respectively.

Construction of coamings in positions 1 and 2 is to comply with the requirements of 2.6, Part II "Hull" and in case of glass-reinforced plastic ships, with the requirements of Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ships and Boats".

7.10.2.2 The height of coamings of the hatchways specified in 7.10.1.2 may be increased in relation to that prescribed by 7.10.2.1 or the coamings may be omitted entirely where the efficiency of the cover tightness and securing means will satisfy the Register. In type "B" ships which are permitted to have the tabular freeboard less than that prescribed by Table 4.1.3.2 of Load Line Rules for Sea-Going Ships, such hatchways with coamings of a decreased height (or the hatchways without coamings) in case they are situated in the exposed parts of the freeboard deck in way of 0.25 of the ship's length L from
the forward perpendicular, are to be strengthened in accordance with 7.10.4.2.

7.10.3 Materials.
7.10.3.1 For steel of hatchway covers, see 1.6.
7.10.3.2 The wood of hatchway covers shall be of good quality and of the type and grade which proved to be satisfactory for this purpose. Wedges are to be of hard wood.

7.10.3.3 Canvas used for making tarpaulins is to be impregnated to make them moisture-resistant and shall not contain jute thread. Mass of 1 m² of canvas before impregnation is to be not less than 0,55 kg. Breaking stress of impregnated canvas band 200 × 50 mm in size is to be at least 3 kN and 2 kN in longitudinal and transverse directions, respectively. When tested for watertightness, the impregnated canvas shall not get wet under water head of 0,15 m acting for 24 hours.

Use of tarpaulins made of synthetic fibre will be specially considered by the Register in each case.

7.10.3.4 The rubber for packing gaskets of hatchway covers is to be elastic, strong, and resistant to atmospheric changes. The rubber is to be of sufficient hardness.

7.10.3.5 Adhesives for fastening the rubber in the grooves of hatchway covers are to meet the requirements of 6.5, Part XIII "Materials".

7.10.4 Design loads.
7.10.4.1 Hatchway covers are to be designed to sustain deck cargoes which are intended to be carried on these covers. Where operation of the cargo handling cars on hatchways covers is anticipated in the course of the ship’s service, during cargo handling operations, the loads induced by such cars are to be taken into consideration. For hatchway covers in positions 1 and 2 it is additionally required that the value of the design deck load is not to be less than the product of the cover area by the load intensity given in Table 7.10.4.1. For ships of more than 24 m, but less than 100 m in length the design load intensity is to be found by linear interpolation.

<table>
<thead>
<tr>
<th>Location of cargo hatchways</th>
<th>Design load intensity, kPa, at ship’s length L</th>
</tr>
</thead>
<tbody>
<tr>

<td>24 m and less</td>
</tr>
<tr>
<td>Position 1</td>
<td>9.81</td>
</tr>
<tr>
<td>Position 2</td>
<td>7.35</td>
</tr>
</tbody>
</table>

For ships of less than 24 m in length of restricted area of navigation engaged on international voyages and for all ships of restricted area of navigation not engaged on international voyages the load intensity reduced by:

15 per cent for ships of restricted areas of navigation II, II CPI and III.
30 per cent for ships of restricted area of navigation III may be taken in calculations instead of the values given in Table 7.10.4.1.

In any case, the design load for open-deck hatch covers is not to be adopted less than $P_w$ determined in accordance with 1.3.2.2, Part II "Hull".

7.10.4.2 In type "B" ships which are permitted to have the freeboard less than prescribed by Table 4.1.3.2 of Load Line Rules for Sea-Going Ships, if they are provided with hatchways without coamings in the exposed parts of the freeboard deck in way of 0.25 of the ship’s length $L$ from the forward perpendicular, the design load for covers of these hatchways is to be increased by 15 per cent over that given in Table 7.10.4.1. Where these hatchways are provided with coamings, but their height is less than given in 7.10.2.1, the percentage of the load increase is to be found by linear interpolation.

7.10.4.3 When deck cargo other than containers is carried, the design load on cargo hatch covers should not be less than stipulated by 1.3.4.1, Part II "Hull".

7.10.4.4 When containers of international standard types are carried on hatch covers, the design load $P_z$, in kN, concentrated at the points where the corner fittings of the containers are installed is determined, for the purpose of calculating the deck cargo effect as stipulated by 7.10.4.1 and 7.10.4.3, by the following formula:

$$P_z = mg(1 + a_z)$$

7.10.4.5 Where cargo-handling cars and wheeled vehicles are to be used on hatch covers during cargo-handling operations, the loads upon hatch covers are determined in accordance with 3.2.3, Part II "Hull".

7.10.4.6 The hatch covers of lower decks not intended for the carriage of cargo should be designed to bear:

- evenly distributed load of 2 kPa intensity;
- force of 3 kN applied to any point upon the hatch cover.

7.10.4.7 In strength and rigidity calculations of hatch covers, their own weight is ignored.

7.10.5 Strength and rigidity calculations of hatch covers.

7.10.5.1 Where hatch covers in positions 1 and 2 come under design loads, the stresses in the structural components are not to exceed the values of Table 7.10.5.1.
7.10.5.2 Where the hatch covers of lower decks come under design loads, the stresses in the structural components are not to exceed the values of Table 7.10.5.2.

7.10.5.3 For hatch covers in positions 1 and 2, the deflection under the design load mentioned in 7.10.4.1 and 7.10.4.2 is not to exceed the following values:

*Whichever is less.

σ = normal stresses;
τ = tangential stresses;
σ<sub>com</sub> = combined stresses, see 1.5.1;
R<sub>xy</sub> = upper yield strength of hatch cover material;
R<sub>u</sub> = ultimate strength of hatch cover material.

7.10.7 Construction of hatchway covers specified in 7.10.1.1.

7.10.7.1 These covers are to be so constructed as to prevent their accidental opening under the effect of sea and weather.

7.10.7.2 Portable beams are to be placed in sockets of the coamings and locked therein. Where portable beams are of sliding type, efficient devices are to be provided for locking them when the hatchway is either closed or open.

7.10.7.3 If the hatchway covers are jointed on the portable beam, a vertical flat bar of at least 60 mm in height is to be attached by welding to the upper flange of the beam.

7.10.7.4 The width of each bearing surface for hatchway covers is to be at least 65 mm.

7.10.7.5 Where the covers are made of wood, their finished thickness is to be at least 60 mm for a load intensity sustained by the cover equal to 17.16 kPa and less. If the load intensity exceeds this value, the above thickness is to be increased by 1.5 mm per 0.981 kPa of overload. In all cases, the portable beams of the hatchway provided with wooden covers are to be spaced not more than 1.5 m apart.

Independently of the provisions of 7.10.5, all covers made of steel are to have the thickness of their plating at least 0.01 times the spacing of stiffeners or 6 mm, whichever is the greater.

If the covers are made of light alloys, the minimum thickness of their top plating will be specially considered by the Register in each case.

7.10.7.6 The hatchways in positions 1 and 2 are to be protected by at least two layers of tarpaulins.

Tarpaulins are to be tightly pressed against the hatchway coamings with the aid of battens and wedges, for which purpose the coamings, as well as horizontal stiffeners, if fitted, are to be provided with cleats of at least 65 mm wide and 10 mm thick; edges of the cleats shall be rounded so that the possibility of cutting the wedges is brought to the minimum. Cleats are to be spaced not more than 600 mm centre to centre; the cleats along each side or end are to be not more than 150 mm from hatch corners. The cleats are to be so mounted as to provide setting of wedges in them in the fore to aft direction on the side coamings, and from the sides to centre line direction on the end coamings.

Wedges are to be not less than 200 mm in length and 50 mm in width with a taper of not more than 1:6, and a thickness not less than 13 mm at the thinnest point.

7.10.7.7 Steel bars or other equivalent means are to be provided in order to efficiently and independently secure each section of hatchway covers after
the tarpaulins are battened down. Sections of hatchway covers of more than 1.5 m in length shall be secured by at least two such securing appliances.

**7.10.8 Construction of hatchway covers specified in 7.10.1.2.**

**7.10.8.1** These covers are to be so constructed as to prevent their accidental opening under the effect of sea and weather.

When secured, the covers shall be pressed against the bearing surface of the coaming without further deformation of the packing gasket.

**7.10.8.2** The scantlings of components of hatch covers made of steel are determined in conformity with the requirements of 7.10.4 — 7.10.6.

For primary members and webs, the effective flange width is determined in accordance with 1.6.3.3 and 1.6.3.4, Part II "Hull", the effective flange thickness is determined in accordance with 1.6.3.2 of the same Part. The application of light alloys is in each case subject to special consideration by the Register.

**7.10.8.3** Irrespective of the provisions of 7.10.8.2 being complied with, the top plating thickness $t$, in mm, of steel hatch covers should not be less than determined from the formula

$$ t = 10a $$  \hspace{1cm} (7.10.8.3)

where $a$ = distance between the stiffeners, in m.

In any case, the top plating thickness is not to be less than 6 mm.

**7.10.8.4** Where cargo-handling cars are to be used on hatch covers, the top plating thickness should not be less than stipulated by 3.2.4.1, Part II "Hull".

**7.10.8.5** The hatchway covers on which containers are carried shall be provided, in way of corner fittings of containers, with structural elements ensuring immediate load transfer from the containers to the cover framing.

If the above-mentioned structural elements are not coincident with the cover stiffeners in way of fitting the former, the additional stiffeners shall be provided having section modulus equal to 0.8 times that of main stiffeners of the cover. In this case, structural bonding of main and additional stiffeners shall be ensured.

**7.10.8.6** Where dry cargo holds are adapted for transportation of dangerous goods (see 1.2, Part VI "Fire Protection"), cargo hatch covers of the upper deck are to be made of steel; the cargo hatch covers of upper and lower decks are to be provided with drives ensuring smooth movement (without striking) of covers and all parts of hatch covers. The design of the drives should be such that in the case of their failure no dropping of the covers could occur during closing or opening operations; reliable securing of covers kept open should be provided. Measures are to be taken to prevent the ingress of working fluid of the drives for these hatch covers into cargo holds (see also 2.8.2 and 2.8.15, Part VI "Fire Protection").

**7.10.8.7** Each hatch cover or section of hatch covers should be fitted with proper securing devices along its transverse and longitudinal sides, which would ensure the weathertightness of the cover.

The number of securing devices is not to be less than two on each side of the section, and the securing devices should be spaced not more than 6 m apart.

The securing device fitted in close proximity to the corner of the section is considered to be the device both for the transverse and longitudinal sides of the sections, and the securing device fitted in way of two jointed sections and pressing the corners of the two sections against the coaming is considered to be the device both for the transverse and longitudinal sides of the two sections adjacent to the device.

**7.10.8.8** Each securing device of the hatchway cover shall be calculated for the action of force $F$, in N, determined from the formula

$$ F = (1/n)[mg(8a_o - K) + pL] $$  \hspace{1cm} (7.10.8.8)

where $m$ = total mass of covers of the hatchway under consideration, kg;

$n$ = total number of securing devices along the perimeter of the hatchway under consideration;

$l_o$ = clear perimeter of the hatchway under consideration, m;

$p$ = pressure of the packing gasket when compressed to the maximum depth possible for the accepted design, N/m. Where the value $p$ is less than 5000 N/m in calculations performed according to Formula (7.10.8.6), $p$ is taken equal to 5000 N/m;

$g$ = acceleration due to gravity equal to 9.81 m/s$^2$;

$a_o$ = dimensionless acceleration to be determined in accordance with 1.7 as applied to the centre of gravity of the considered hatchway covers;

$K$ = coefficient to be determined from the formula

$$ K = 0.947 - 20.7/L $$

where $L$ = ship's length, in m.

In any case, $F$ should not be taken less than 40 kN.

**7.10.8.9** When the securing device is under the effect of the design force specified in 7.10.8.8, the stresses in its parts shall not exceed 0.8 times the upper yield stress of material.

**7.10.8.10** Irrespective of the results calculated in accordance with 7.10.8.8, the free sectional area $A$, in cm$^2$, of the securing device should not be less than determined from the formula

$$ A = \frac{1.4a}{f} $$  \hspace{1cm} (7.10.8.10)

where $a$ = distance between securing devices, in m, which in any case should not be adopted less than 2 m;

$f$ = factor determined from the formula

$$ f = \left( \frac{R_u}{250} \right) $$

where $R_u$ = the upper yield strength of the securing device material, in MPa, and should not be adopted greater than 0.7 of the tensile strength of the material;
For hatch covers and hatch cover sections having an area in excess of 5 m², the active diameter of bars and bolts of the securing devices should not be less than 19 mm.

7.10.8.11 Where the packing gasket is compressed to the maximum depth possible and its pressure exceeds 5 000 N/m, the area of securing devices as determined in accordance with 7.10.8.10 should be increased in a relevant proportion.

7.10.8.12 The stiffness of the cover corners is to be sufficient to maintain an adequate pressure of the packing gasket between the securing devices. The cross-sectional inertia moment of the corner members of the covers \( I \), in cm⁴, is to be not less than that determined from the formula:

\[
I = 6p a^4 10^{-3}
\]  
(7.10.8.12)

where \( p \) = pressure of the packing gasket when compressed to the maximum depth possible for the accepted design, in N/m, but not less than 5 000 N/m; 
\( a \) = distance between securing devices, in m.

7.10.8.13 Covers on which cargoes are to be carried are to be provided with securing devices preventing the cover sections from shifting relative to the hatchway coamings during rolling or prolonged statical heel. These securing devices are to be calculated to take up the loads induced therein when the common centre of gravity of the cover with the cargo thereon is affected by the loads directed perpendicular to the centre plane of the ship \( P_y \) and parallel to the centre plane \( P_x \) obtained in N, using the following formulae:

\[
P_y = mg a_y
\]  
(7.10.8.13-1)

\[
P_x = mg a_x
\]  
(7.10.8.13-2)

where \( m \) = total mass of the cover and cargo secured thereon, kg; 
\( g \) = acceleration due to gravity equal to 9.81 m/s²; 
\( a_y, a_x \) = dimensionless accelerations obtained in accordance with 1.7 as applied to the common centre of gravity of the considered cover with cargo thereon. For hatchway covers of shipborne barges, when determining \( a_y \) and \( a_x \), to be taken as \( L \) and \( B \) are the length and the breadth of the barge carrier (on which the considered shipborne barge is transported), and as \( x \) and \( z \) the maximum possible distances between the centre of gravity of the cover, and the midship frame and the summum load waterline of the barge carrier, respectively, are to be taken.

Stresses arising in the parts of securing devices are not to exceed 0.8 times the upper yield stress of the material of which these devices are made.

7.10.8.14 In ships having large hatchways for which considerable deformation of the hatchway coamings is possible in seaway:

.1 the design of the securing device shall allow for possible horizontal shifting of the point of attachment of this device to the coaming by a value equal to possible horizontal shifting of the cover section from the coaming;

.2 in the hinged joints of the cover sections to each other and to the hatchway coaming provision shall be made for clearances adequate for possible horizontal relative shifting of the sections without obstruction;

.3 over the lower bearing edges of cover sections, an appropriate metal contact surface should be provided allowing for free gliding of sections over hatch coamings;

.4 the horizontal stiffener of hatch coaming on which the covers rest should be properly stiffened to ensure a permanent contact of the cover section and coaming.

7.10.8.15 Hydraulic drives of hatch covers should comply with Part IX "Machinery".

The hatchway covers and the drives are to be so designed as to make it possible to close the hatch kept open before and to secure it even in case of the main power drive failure. The device for reliable locking of the covers kept open shall be provided. The direction of the cover opening shall ensure, wherever possible, maximum protection of open hatches from exposure to sea.

7.10.9 Hatch cover designs for lower decks.

The hatch cover designs for lower decks should comply with the requirements of 7.10.7 and 7.10.8.

7.11 HATCHWAYS OF CARGO TANKS IN TYPE "A" SHIPS

7.11.1 Openings for hatchways of the cargo tanks on tankers are to be of round or oval form. Height of the coamings of cargo tank hatchways will not be regulated by the Register. Construction of the coamings of cargo tank hatchways is to comply with the requirements of 3.5.5.1, Part II "Hull".

7.11.2 Covers of hatches and tank cleaning openings are to be made of steel, bronze or brass. Use of other materials is subject to special consideration by the Register in each case.

In ships carrying flammable liquids in bulk use of light alloys for covers of hatchs and tank cleaning openings is not permitted.

7.11.3 Covers of the cargo tank hatchways are to be permanently attached and tight, when secured, under the inner pressure of liquid carried in tanks to a head of at least 2.5 m. Tightness is to be provided by a rubber or other suitable gasket being resistant to the liquids which are carried in the cargo tanks.

7.11.4 The plate of the cargo tank hatchway covers is to be at least 12 mm in thickness if it is of steel. The cover plate is to be reinforced by stiffeners made of flat bars not less than 80 x 12 mm in size, and spaced at every 600 mm of the cover length, or the cover is to be of spherical shape.
7.11.5 The hatchway cover is to be provided with a sighting port having an inner diameter of 150 mm and closed by a cover of similar construction.

7.11.6 Materials and designs of cargo tank hatchway covers in ships intended to carry flammable liquids are to be so selected as to preclude spark formation during opening and closing the covers.

7.12 OPENINGS IN WATERTIGHT SUBDIVISION BULKHEADS AND THEIR CLOSING APPLIANCES

7.12.1 General provisions.

7.12.1.1 Unless expressly provided otherwise, the present Chapter covers ships to which the requirements of Part V "Subdivision" apply.

For other ships, the requirements of this Chapter apply to bulkheads only, provided in accordance with 2.7.1.3, Part II "Hull"; for these ships, the requirements may be relaxed, and the degree of relaxation will be specially considered by the Register in each case.

In ships indicated in 7.12.6.1, the requirements of 7.12.2 — 7.12.5 may be relaxed for doors fitted in watertight subdivision bulkheads dividing a cargo space from an adjoining cargo space provided the requirements of 7.12.6 are met.

7.12.1.2 The number of openings in watertight bulkheads should be reduced to a minimum compatible with the design and normal service conditions of the ship.

7.12.1.3 Where piping and electric cables are carried through watertight subdivision bulkheads, the requirements of 5.1, Part VIII "System and Piping" and of 16.8.6, Part XI "Electrical Equipment" should be taken into consideration.

7.12.2 Doors in watertight subdivision bulkheads.

General provisions.

7.12.2.1 The doors are to be made of steel. The use of other materials will be specially considered by the Register in each case.

7.12.2.2 Doors are to withstand the pressure of a water head of the height measured from the lower edge of doorway to the underside of bulkhead deck plating at the centre line, but not less than 5 m.

7.12.2.3 Under the effect of water head specified in 7.12.2.2, the stresses in the door frame and door plate are not to exceed 0.6 times the upper yield stress of their material.

7.12.2.4 When closed, the doors are to be tight under the pressure of a water head of the height specified in 7.12.2.2.

7.12.2.5 Each means of operation of the doors should alone ensure closure of the door with the ship listed 15° either way and with a trim up to 5°. Doors closed by dropping or by the effect of a dropping weight are not permitted. Portable plates secured by bolts only are not permitted.

7.12.3 Regulations concerning the positioning of doors.

7.12.3.1 No doors are permitted in:
- collision bulkhead below the bulkhead deck of ships having a subdivision distinguishing mark in the class notation and below the freeboard deck of all other ships;
- watertight subdivision bulkheads dividing a cargo space from an adjoining cargo space except where the Register is satisfied that such doors are essential. In this case, the doors may be hinged, sliding or of another equivalent type, but they should not be remotely controlled.

In passenger ships and special-purpose ships, as well as in ships with subdivision distinguishing mark in the class notation, the outboard vertical edges of the doors are not to be located at less than 0.2 of the ship breadth. This distance is to be measured at right angles to the centre line of the ship at the level of the deepest subdivision loadline.

7.12.3.2 In addition to doors at entrances to propeller shaft tunnels, not more than one door may be provided in each watertight subdivision bulkhead within spaces containing main engines, boilers and auxiliary machinery.

Where two or more propeller shafts are fitted, their tunnels are to be connected by a passageway. In a twin-screw ship, there should only be one door between the engine room and tunnel spaces, and if the propellers are more than two, only two doors should be provided. All the doors are to be located as high as practicable.

Hand gear for operating the doors from above the bulkhead deck and for operating doors at entrances to shaft tunnels should be fitted outside the engine room.

7.12.4 Doors in cargo ships.

7.12.4.1 The requirements of 7.12.4 apply to doors fitted in the subdivision bulkheads of cargo ships except the doors of special purpose ships and those mentioned under 7.12.6.

7.12.4.2 The doors should be sliding doors with horizontal or vertical motion, they should be both hand- and power-operated.

If hand-operated, it should be possible to open and close the door from both sides of the bulkhead.

If power-operated, closing of the doors from the control station on the navigating bridge should be possible.

7.12.4.3 At the door control stations, visual indicators should be provided to show whether the doors are open or closed. An alarm should be provided to control the door closing.

Power source, control station and indicators should be operable in the case of main power source
failure. Special attention should be paid to minimizing the effects of the control system failure.

7.12.4.4 Passage doors which ensure the water integrity of inside openings usually closed when at sea should be fitted up with indication means, in their close proximity and on the bridge, to indicate whether the doors are open or closed. On each side of such a door, an inscription should be secured to the effect the door is not to be left open. These doors should only be used by the permission of the watch officer.

7.12.5 Doors in passenger ships and special purpose ships.

7.12.5.1 The requirements of 7.12.5 apply to doors fitted in the subdivision bulkheads of passenger ships and special purpose ships except those mentioned in 7.12.6.

7.12.5.2 The doors should be sliding doors with horizontal or vertical motion, they should be both hand- and power-operated.

The maximum width of the door aperture is not to exceed 1.2 m. Fitting of doors with the aperture width in excess of 1.2 m is subject to special consideration by the Register in each case.

7.12.5.3 If hand-operated, it should be possible to open and close the door from both sides of the bulkhead and, in addition, from an accessible position above the bulkhead deck by means of a hand wheel, knob or another similar gear. The force applied to the hand wheel, knob or similar gear while the door is in motion is not to exceed 157 N.

If the door is not visible from the position above the bulkhead deck where the gear is fitted, indicators should be provided showing the positions of the hand wheel, knob and similar gear at which the door is open or closed.

When hand-operated, the time necessary for a complete closure of the door is not to exceed 90 s with the ship upright.

7.12.5.4 Door control knobs should be fitted on either side of the bulkhead at a minimum height of 1.6 m above deck plating and so arranged as to enable persons passing through the doorway to hold both the knobs in a position preventing door closure.

7.12.5.5 The power gear should be controllable (i.e. door opening and closing should be possible) by local control stations on either side of the bulkhead.

Besides being controlled directly at the door, the power gear should also be controllable (for door closure) from the main control station.

Remote opening of any door from the main control station should not be possible.

The main control station for doors should be located in the wheel-house.

7.12.5.6 The power gear should ensure door closure in not more than 40 s and not less than 20 s with the ship upright, as well as a simultaneous closure of all doors within not more than 60 s.

7.12.5.7 The power gear of the doors should have either:

- a centralized hydraulic system with two independent power sources each consisting of a motor and pump capable of simultaneously closing all doors. In addition, there should be for the whole installation hydraulic accumulators of sufficient capacity to operate all the doors at least three times, i.e. closed — open — closed; or

- an independent hydraulic system for each door with each power source consisting of a motor and pump capable of opening and closing the door. In addition, there should be a hydraulic accumulator of sufficient capacity to operate the door at least three times, i.e. closed — open — closed; or

- an independent electrical system and motor for each door with each power source consisting of a motor capable of opening and closing the door. The power source should be capable of being automatically supplied by a transitional source of emergency electrical power, as required by 19.1.2.7. Part XI "Electrical Equipment" in the event of failure of either the main or emergency source of electrical power and with sufficient capacity to operate the door at least three times, i.e. closed — open — closed.

7.12.5.8 Door controls, including hydraulic piping and electric cables, should be kept as close as practicable to the bulkhead in which the doors are fitted, in order to minimize the likelihood of them being involved in any damage which the ship may sustain.

7.12.5.9 Each door should be provided with an audible alarm, distinct from any other alarm in the area, which will sound whenever the door is closed remotely by power and which should sound for at least five seconds, but not more than ten seconds, before the door begins to move, and should continue sounding until the door is completely closed. In the case of remote hand operation it is sufficient for the audible alarm to sound only when the door is moving.

7.12.5.10 The central operating console at the navigating bridge should have a switch with two modes of control:

- a "local control" mode which should allow any door to be locally opened and closed without automatic closure and

- a "doors closed" mode which should allow doors to be opened locally and should automatically reclose the doors upon release of the local control mechanism.

The switch should normally be in the "local control" position. The "doors closed" position should only be used in an emergency or for testing purposes.

7.12.5.11 The central operating console at the navigating bridge should be provided with a diagram
showing the location of each door, with visual indicators to show whether each door is open or closed. A red light should indicate a door fully open and a green light should indicate a door fully closed. When a door is closed remotely, the red light should indicate the intermediate position by flashing. The indicating circuit should be independent of the control circuit for each door.

7.12.5.12 Where trunkways or tunnels for access from crew accommodation to the stokehold, for piping, or for any other purpose are carried through main transverse watertight bulkheads, they shall be watertight. The access to at least one end of each such tunnel or trunkway, if used as a passage at sea, shall be through a trunk extending watertight to a height sufficient to permit access above the margin line. The access to the other end of the trunkway or tunnel may be through a watertight door of the type required by its location in the ship. Such trunkways or tunnels shall not extend through first subdivision bulkhead abaft the collision bulkhead.

7.12.5.13 Where ventilating trunks in connection with refrigerated cargo and ventilation or forced draught trunks are carried through more than one watertight bulkhead, the means of closure at such openings shall be operated by power and be capable of being closed from a central position situated above the bulkhead deck.

7.12.6 Doors in ships designed for the carriage of vehicles.

7.12.6.1 The requirements of 7.12.6 apply to doors fitted in watertight subdivision bulkheads separating a cargo space from an adjacent cargo space in ships designed for the carriage of vehicles and covered by the requirements of Part V "Subdivision", if the total number of persons on board (excluding the master and the members of the crew or other persons employed or engaged in any capacity on board a ship on the business of that ship, and also a child under one year of age) is not greater than the value $N$ determined from the formula

$$N = 12 + 0.044A$$  \hspace{1cm} (7.12.6.1)

where $A =$ total deck area, in $m^2$; of spaces available for the stowage of vehicles where the clear height at the stowage position and at the entrances to such spaces is not less than 4 $m$.

7.12.6.2 The doors specified in 7.12.6.1 may be fitted at any level if the Register is satisfied that such doors are essential for the movement of the vehicles in the ship.

The number and arrangement of these doors are subject to special consideration by the Register.

7.12.6.3 The doors specified in 7.12.6.1 shall be fitted as far from the shell plating as practicable, but in no case shall the outboard vertical edge of the door be situated at a distance from the shell plating that is less than 0.2 of the breadth of the ship, such distance being measured at right angles to the centre line of the ship at the level of the subdivision loadline.

7.12.6.4 The doors specified in 7.12.6.1 may be of the following types: hinged, sliding or rolling but they should not be controlled remotely.

The doors shall be fitted with devices ensuring watertightness, securing and locking.

When the sealing material of the door is not classed as non-combustible (see 1.6.1, Part VI "Fire Protection"), the gasket shall be suitably protected from the effects of fire by a method approved by the Register.

The doors shall be fitted with a device which prevents unauthorized opening.

7.12.6.5 The doors specified in 7.12.6.1 shall be so designed that they could be opened and closed both in case of unloaded and loaded decks, the deck deflections under the effect of the stowed cargo taken into account.

The securing devices of the door shall be so designed that account is taken of the deck deflections under the effect of the stowed cargo resulting in relative displacement of the structural elements of the bulkhead and the door.

7.12.6.6 Where watertightness is ensured by rubber or other suitable gaskets and securing devices, at each corner of the door or door section (if any) the securing devices shall be fitted.

The securing devices of such doors shall be designed to withstand the following forces, in kN:

- $F_1$ for securing devices fitted at the lower edge of the door;
- $F_2$ for securing devices fitted at the upper edge of the door;
- $F_3$ for securing devices fitted at the vertical edge of the door.

These forces are to be obtained from the formulae:

$$F_1 = \frac{9.81A}{n_1} \left( H_1^2 \frac{h}{2} - \frac{h^3}{6} \right) + 29.42,$$  \hspace{1cm} (7.12.6.1-1)

$$F_2 = \frac{9.81A}{n_2} \left( H_1^2 \frac{h}{3} - \frac{h^3}{2} \right) + 29.42,$$  \hspace{1cm} (7.12.6.1-2)

$$F_3 = \frac{a}{A} [F_1(n_1 - 1)h_1 + F_2(n_2 - 1)(h - h_1)]$$  \hspace{1cm} (7.12.6.1-3)

where $A =$ clear area of the door, $m^2$;

$H_1 =$ vertical distance from the lower edge of the door opening to the lower edge of the plating of the bulkhead deck at the centre line of the ship, in $m$, but not less than 5 $m$;

$h =$ clear height of the door, $m$;

$h_1 =$ vertical distance from the securing device considered to the upper edge of the door, $m$;

$a =$ half the sum of the vertical distances from the securing device considered to the nearest upper and lower securing devices, $m$;
\[ n_1 = \text{number of the securing devices fitted on the lower edge of the door}; \]
\[ n_2 = \text{number of the securing devices fitted on the upper edge of the door}. \]

When the securing device is under the effect of the design force \( F_1, F_2 \) or \( F_3 \), the stresses in its parts shall not exceed 0.5 times the upper yield stress of material.

**7.12.6.7** The operation of the doors specified in 7.12.6.1 shall be by means of local control only. On the bridge indicators shall be provided to show automatically that each door is closed and all door fastenings are secured.

**7.12.6.8** The requirements of 7.12.2.1 to 7.12.2.4 are also applicable to doors specified under 7.12.6.1.

**7.12.7** Manholes in watertight subdivision bulkheads.

**7.12.7.1** The requirements of 7.9 relating to the manholes located on the freeboard deck, raised quarter deck or the first tier of superstructures are generally applicable to the manholes fitted in the watertight subdivision bulkheads.

No manholes are permitted:

- **1** in the collision bulkhead below the bulkhead deck for ships having subdivision distinguishing mark in the class notation, and below the freeboard deck for other ships;
- **2** in watertight subdivision bulkheads separating a cargo space from an adjacent cargo space or a fuel oil tank.

**7.13** CARGO HATCHWAYS OF HOLDS DESIGNED FOR ALTERNATE CARRIAGE OF DRY AND LIQUID CARGOES IN BULK

**7.13.1** The requirements of this Chapter cover the cargo hatchways of holds designed for alternate carriage of liquid cargo in bulk with the density of not over 1.025 t/m³ and of dry cargo; the requirements are applicable in case of carriage of liquid cargo in bulk in the hold filled to not less than 90 per cent of its volume.

When liquid cargoes are carried in bulk in the hold filled to less than 90 per cent, the cargo hatchways are subject to special consideration by the Register.

**7.13.2** Cargo hatchways of holds designed for alternate carriage of dry and liquid cargoes in bulk shall comply with the requirements of 7.10.1, 7.10.2, 7.10.3, 7.10.3.5, 7.10.4 to 7.10.6, 7.10.8, 7.11.5 and 7.11.6.

**7.13.3** Hatchway covers shall be made of steel. The use of other materials for this purpose is subject to special consideration by the Register in each case.

**7.13.4** Hatchway covers, except for the cases specified in 7.13.5, shall be designed to withstand the inner pressure of liquid carried in the hold, the design load being takendepending on the framing system of the cover.

**7.13.5** For transverse framing system of the cover (stiffeners are perpendicular to the centre line of the ship) the uniformly distributed load with the intensity \( p \), in kPa, determined from the following formula, shall be taken as the design load acting upon the whole area of the cover:

\[
p = 0.7P_0 + 1.275(b + 2r) + 0.245l + 2.55K \quad (7.13.4-1)\]

**7.13.6** For longitudinal framing system of the cover (stiffeners are parallel to the centre line of the ship) and also for combined framing system of the cover the variable load shall be taken as the design load acting upon the whole area of the cover.

The law of changing the intensity \( p \), in kPa, is determined from the formula

\[
p = 0.7P_0 + 1.275(b + 2r + 2y) + 2.55K \quad (7.13.4-2)\]

where

- \( b \) = clear width of the hatchway, m;
- \( l \) = clear length of the hatchway, m;
- \( r \) = value taken equal to:
  - distance between longitudinal (parallel to the centre line of the ship) axes of symmetry of hatchways, m, for twin hatchways arranged symmetrically about the centre line of the ship where no longitudinal tight wash bulkhead is provided in the hold;
  - zero for central hatchways and for twin hatchways where the centre line tight wash bulkhead is provided in the hold;
- \( y \) = distance from longitudinal (parallel to the centre line of the ship) axis of symmetry of the hatchway to the point of the cover under consideration, m.

At \( r > 0 \) the value \( y \) is taken to be positive in the direction of the nearest side of the ship from the axis of symmetry of the hatchway and is taken to be negative in the opposite direction.

At the design value of \( r = 0 \) two variants of the design load shall be considered:
- for positive values of \( y \) in one direction and negative values in the other direction from the axis of symmetry of the hatchway;
- with the rule of signs for the value \( y \) opposite to that of the first variant;
- \( P_0 \) = maximum pressure of the pressure/vacuum valve opening, in kPa, (see 5.2.1 and 5.2.5, Part VIII "Pumping and Piping");
- \( K \) = value determined from the formula

\[
K = C - 2.4b \quad (7.13.4-3)\]

where

- \( C \) = value taken equal to:
  - distance measured at the deck level from the side coaming of the hatchway positioned at the ship's side to the shell plating or to the inner longitudinal bulkhead of the side tank, if any, in m, for central hatchways and for twin hatchways if no longitudinal tight wash bulkhead is provided in the hold;
  - distance measured at the deck level from the side coaming of the hatchway positioned at the ship's side to the shell plating or to the inner longitudinal bulkhead of the side tank, if any, in m, or distance measured at the deck level from the side coaming of the hatchway positioned at the centre line to the tight wash bulkhead or to the central tank longitudinal bulkhead nearest to this coaming, if any, in m, whichever of the two distances is greater, for twin hatchways where the tight wash bulkhead is provided in the hold in the centre line;
\[ h = \text{distance between inner edges of the deck plating and cover plating, m.} \]

If the value of \( K \) determined from Formula (7.13.4-3) is negative, the value of \( K = 0 \) shall be taken in the calculations.

**7.13.5** When two or more hatchways are arranged one after another throughout the hold length, the design loads for cargo hatchway covers are subject to special consideration by the Register.

**7.13.6** When the hatchway cover is under the design load, stresses in its parts shall not exceed 0.7 times the upper yield stress of material.

**7.13.7** The sealing parts of the hatchway covers being secured shall be tight under the inner pressure of the liquid carried in the hold not less than 24.5 kPa or double value of the load determined from Formula (7.13.4-2), whichever is the greater.

The tightness shall be provided by rubber or other suitable gaskets being resistant to the liquid carried in the hold.

The securing devices shall be equally spaced, where possible.

**7.13.8** Each securing device of the hatchway cover shall be calculated for the action of the greater force \( F_1 \) or \( F_2 \), in kN, determined from the formulae:

\[
F_1 = \frac{1}{n} \left[ 4.4Q + 294bh(b + 2r + 2K_1) \right] 10^2, \quad (7.13.8-1)
\]

\[
F_2 = \frac{34.3bh}{n} + 44 \quad (7.13.8-2)
\]

where \( Q \) = total mass of covers of the hatchway under consideration, kg;
\( n \) = total number of securing devices along the perimeter of the hatchway under consideration;
\( K_1 = \text{value determined from the formula} \)

\[
K_1 = C - 0.75h. \quad (7.13.8-3)
\]

If the value of \( K_1 \) determined from Formula (7.13.8-3) is negative, the value of \( K_1 = 0 \) shall be taken in the calculations.

For \( b, l, r, C \) and \( h \), see 7.13.4.

**7.13.9** Each securing device of the side coaming of the hatchway shall be calculated for (in addition to the force specified in 7.13.8) the action of force \( F_3 \), in kN, determined from the formula

\[
F_3 = ab(1.13b + 1.72r + 1.72K_2) + 35.3 \quad (7.13.9-1)
\]

where \( a = \text{distance between securing devices, m; \quad K_2} = \text{value determined from the formula} \)

\[
K_2 = C - 2.14h. \quad (7.13.9-2)
\]

If the value of \( K_2 \) determined from Formula (7.13.9-2) is negative, the value of \( K_2 = 0 \) shall be taken in the calculations.

For \( b, r, C \) and \( h \), see 7.13.4.

**7.13.10** When the securing device is subjected to the design force specified in 7.13.8 and 7.13.9, stresses in its parts shall not exceed 0.7 times the upper yield stress of material.

**7.13.11** Independently of the provisions of 7.10.8.2 and 7.13.6, for all covers made of steel the thickness of their plating shall be not less than 8 mm or the value \( s \), in mm, determined from Formula (7.13.11), whichever is the greater

\[
s = 25a_1 \sqrt{p/R_{SH}} \quad (7.13.11)
\]

where \( p = \text{load, kPa, determined from Formula (7.13.4-2), with the value } y \text{ measured from the longitudinal (parallel to the centre line of the ship) axis of symmetry of the hatchway to the edge of the plate under consideration most distant from this axis, in m; \quad a_1 = distance between the cover stiffeners of the main direction, m; \quad R_{SH} = upper yield stress of the cover plating material, MPa.} \]

Special earthing need not be used in case reliable electrical contact is ensured between the covers and ship’s hull when the hatchway is closed and secured.

**7.14. CARGO HATCHWAYS OF HOLDS DESIGNED FOR CARRIAGE OF CARGOES IN BULK**

**7.14.1** Hatchway covers on the ships intended for carriage of cargoes in bulk shall comply with the requirements of 7.10.1 — 7.10.8.

Moreover, hatchway covers at 0.25 length of ship from the forward perpendicular shall comply with the requirements of 7.14.2 — 7.14.7.

**7.14.2** Hatchway covers shall be designed to withstand the load \( P \) (kPa) determined from the formula:

\[
P = 19.6 \sqrt{H} \quad (7.14.2-1)
\]

where \( H \) is determined from the formula

\[
H = 0.14A_1 \sqrt{VL/C_b \cdot d_f} \quad (7.14.2-2)
\]

\( A_1 = \text{factor, which value depends on the location of the middle length of hatchway cover in relation to the forward perpendicular, is defined from the Table 7.14.2-2; \quad V = \text{design headway speed (knots) is taken not less than 13 knots; \quad L = \text{ship length (m); \quad C_b = \text{coefficient of fullness at the summer loadline draught; \quad d_f = vertical distance (m) between the summer loadline and the higher edge of the hatchway coaming.}} \)
7.14.3 Normal and tangential stresses (σ and τ, MPa) arising in the stiffeners of hatchway covers, main load carrying structural and plating elements shall not exceed the following values:

\[
\sigma = 0.80 R_{\text{HY}} \\
\tau = 0.45 R_{\text{HY}}
\]

(7.14.3-1) (7.14.3-2)

where

\[ R_{\text{HY}} \] — upper yield stress of material (MPa).

Whilst defining σ and τ stresses one shall use design dimensions of transverse sections.

For determination of the section modulus of the main load carrying structural elements, the effective rider’s width shall not exceed values defined in 7.14.5.

7.14.4 The design plate thickness \( t \) (mm) of the hatchway cover plating is determined from the formula

\[ t = 17.9a \sqrt{P/R_{\text{HY}}} \]

(7.14.4)

where

\[ a \] — distance between stiffeners (m);
\[ P \] — load according to 7.14.2;
\[ R_{\text{HY}} \] — see 7.14.3.

7.14.5 The effective rider’s width of the main framing which is parallel to stiffeners \( b_1 \) (m) is determined from the formula:

\[ b_1 = K_1 c \]

(7.14.5-1)

where

\[ K_1 = \text{factor defined by the following formulae:} \]
\[ K_1 = 1.8/f - 0.8/f^2 \text{ at } f > 1.0; \]
\[ K_1 = 1.0 \text{ at } f \leq 1.0; \]
\[ f = 10^{0.05 \sqrt{R_{\text{HY}}/E}}; \]
\[ c \] — see 7.14.4;
\[ R_{\text{HY}} \] — see 7.14.3;
\[ E \] — elastic modulus of the material (N/mm²). For steel it is assumed for 2.06×10^5.

The effective rider’s width of the main framing which is perpendicular to stiffeners \( b_2 \) (m) is determined from the formula:

\[ b_2 = K_2 d \]

(7.14.5-2)

where

\[ K_2 = \text{factor defined by the following formula:} \]
\[ K_2 = K_1 c/d + 0.115(1-c/d)(1+1/f)^2 < 1.0; \]
\[ d \] — the larger and the smaller plate sides (m), respectively;
\[ K_1, f \] — see above.

7.14.6 For ships with no forecastle or breakwater, coamings’ thickness of the forward hold are to be not less than those required by 2.12.3.2., Part II "Hull" for end bulkheads or deckhouses of this region.

7.14.7 The corrosion increment to the plating and stiffeners’ thickness of any type of hatchway covers (excluding pontoon hatchway cover) is to be taken at the rate of 2 mm.

For the pontoon hatchway covers the corrosion increment is to be taken at the rate of:

- 2 mm for upper and lower plating;
- 1.5 mm for inner structures.

7.15 ACCESS TO SPACES IN THE CARGO AREA OF TYPE "A" SHIPS

7.15.1 Access to cofferdams, ballast tanks, cargo tanks and other spaces in the cargo area should be directly from the open deck and such as to ensure their complete inspection. Access to double bottom spaces may be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.

7.15.2 For access through horizontal openings, hatches or manholes, the dimensions should be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening should be not less than 600×600 mm.

7.15.3 For access through vertical openings or manholes providing passage through the length and breadth of the space, the minimum clear opening should be not less than 600×800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other footholds are provided.

7.15.4 For ships of less than 5000 t deadweight, smaller dimensions may be approved as compared to those stipulated by 7.15.2 and 7.15.3, subject to the special consideration of the Register in each case.

7.16 ADDITIONAL REQUIREMENTS FOR OPENINGS AND THEIR CLOSING APPLIANCES IN RO-RO PASSENGER SHIPS

7.16.1 Where vehicle ramps are installed in the ship to give access to spaces below the bulkhead deck, their openings in the bulkhead deck shall be able to be closed weathertight to prevent ingress of water below, alarmed and indicated to the navigating bridge.

7.16.2 Where fitting of particular accesses to spaces below the bulkhead deck is necessary for the
essential working of the ship (e.g. the movement of machinery and stores, etc.) such accesses shall be provided with watertight closures, alarmed and indicated to the navigating bridge.

7.16.3 Subject to provisions of paragraphs 7.16.1 and 7.16.2 all accesses that lead to spaces below the bulkhead deck shall have a lowest point which is not less than 2.5 m above the bulkhead deck.

7.16.4 Indicators shall be provided on the navigating bridge for all shell doors, loading doors and other closing appliances which, if left open or not properly secured, could lead to flooding of a special category space or ro-ro cargo space. The indicator system shall be designed on the fail safe principle and shall show by light alarms if the door is not fully closed or if any of the securing arrangements is not in place and fully locked, and by audible alarms if such door or closing appliances become open or the securing arrangements become unsecured.

The indicator panel on the navigating bridge shall be equipped with a mode selection function "harbour/sea voyage" so arranged that an audible alarm is given on the navigating bridge if the ship leaves harbour with the bow doors, inner doors, stern ramp or any other side shell doors not closed or any closing device not in the correct position. The power supply for the indicator system shall be independent of the power supply for operating and securing the doors.

7.16.5 Television surveillance and a water leakage system shall be arranged to provide an indication to the navigating bridge and to the engine control station of any leakage through inner and outer bow doors, stern doors or any other shell doors which could lead to flooding of special category spaces or ro-ro cargo spaces.

7.16.6 Special category spaces and ro-ro cargo spaces shall be continuously patrolled or monitored by effective means, such as television surveillance, so that any movement of vehicles in adverse weather conditions and unauthorized access of passengers thereto can be detected whilst the ship is underway.

7.16.7 Documented operating procedures for closing and securing all shell doors, loading doors and other closing appliances which, if left open or not properly secured could lead to flooding of special category space or ro-ro cargo space, shall be kept on board and posted at an appropriate place.

7.16.8 In ships constructed before 1 July 1997 all accesses from the ro-ro deck that lead to spaces below the bulkhead deck shall be made weathertight and means shall be provided on the navigating bridge, indicating whether the access is open or closed.

The said requirement shall apply not later than the date of the first periodical survey after 1 July 1997.

8 ARRANGEMENT AND EQUIPMENT OF SHIP'S SPACES, VARIOUS EQUIPMENT, ARRANGEMENTS AND OUTFIT

8.1 GENERAL PROVISIONS

8.1.1 The requirements for the arrangement and equipment of machinery spaces are specified in Part VII "Machinery Installations" and those relating to refrigerating machinery spaces, refrigerant store-rooms, as well as refrigerated cargo spaces are set forth in Part XII "Refrigerating Plants".

8.1.2 In berth-connected ships, the arrangement and equipment of spaces, various devices and equipment must comply with the relevant requirements of 8.4 and 8.5 as in the case of passenger ships.

Besides, a berth-connected ship should have at least two companion ladders fitted as far away from each other as possible. The companion ladders are to be not less than 0.2 m wide where the total of passengers and crew on board does not exceed 50. For each 10 persons above 50, the companion ladder breadth is to be increased by 5 cm.

8.2 LOCATION OF SPACES

8.2.1 The chart room is to be located in a space adjacent to the wheelhouse. The chart room and the wheelhouse may be situated in a common space.

8.2.2 No accommodation spaces are to be arranged forward of the collision bulkhead and abaft of the afterpeak bulkhead below the bulkhead deck (see also 2.1.5.1, 2.1.14, 2.8.14, Part VI "Fire Protection").

8.3. NAVIGATING BRIDGE

8.3.1. General provisions

8.3.1.1 The ship’s control station is to be located in an enclosed space of the wheelhouse on the navigating bridge. The navigating bridge is to be located so as to ensure:

- proper visual control of the ship’s running;
- good visibility with maximum view of water surface;
good audibility of sound signals of the approaching ships;
for tugs, possibility of visual control of tow line during towing operations. It is recommended to arrange the steering control station at the ship's centre line.

8.3.2 Visibility from the navigating bridge on the ships of length of 45 metres and more.

8.3.2.1 The view of the water surface from the ship's control station shall not be shadowed for a distance of more than two ship lengths or 500 metres whichever is less and in the direction to the ship bow the view shall not be shadowed by 10° on each side with no regard of the type of deck cargo, draught and trim. Shadowed sectors of no more than 5° are allowed.

8.3.2.2 Any shadowed sector incurred by cargo, cargo arrangement or other hindrances in front of the wheelhouse worsening the view of the water surface from the ship's control point shall not exceed 10°. The total of the shadowed sector shall not exceed 20°. Sectors of clear view between shadowed sectors shall not be less than 5°.

8.3.2.3 Horizontal view from the ship’s control point shall be not less than 225°, i.e. 22.5° abait each side’s beam. From each wing of the bridge the view shall be not less than 225°, i.e. not less than 45° to the other side and further from the bow to the stern. From the main rudder control station the view shall be not less than 60° to each side.

8.3.2.4 Ship side shall be visible from the bridge wing. The lower edge of windows in the front bulkhead of the navigating bridge is to be as close as possible to the bridge deck and it shall not close the view. The upper edge of windows of the front bulkhead of the navigating bridge shall be at such level which provides an unhindered view from the ship's control point for a man whose eyes are at the height of 1800 mm from the bridge deck at a heavy pitch. By the special Register approval the said height may be reduced to 1600 mm in certain cases.

8.3.2.5 Construction and lay-out of windows in the wheelhouse shall meet the following requirements:

the space between windows is to be minimal and not to be located directly in front of the watchkeeper’s working place;

deckhouse front windows’ upper edge is to have a ledge declining inside by not less than 10° and not more than 25° to avoid reflection;

polarized or toned glasses shall not be fitted;

a clear view through the front two windows of the deckhouse and if provided by its construction through the additional windows is to be provided with no regard of the weather.

8.3.2.6 Ships of exceptional design which by their design characteristics are not able to comply with the requirements of 8.3.1.1 — 8.3.2.5 shall be fitted with appropriate arrangements and means which as far as it is efficient and practically possible meet the requirements of the present Chapter.

8.4 EQUIPMENT OF DRY CARGO HOLDS

8.4.1 When in ships not having double bottom wooden ceiling is placed on top of the floors, it shall be solid and shall extend up to the bilge. The ceiling is recommended to be made of portable sections of such dimensions and so constructed as to allow of their ready removal at any place.

The thickness of a ceiling is to be:
- at least 40 mm for ships of 30 m in length and less;
- at least 60 mm for ships over 30 m in length;
- at least 70 mm under cargo hatchways.

8.4.2 When in ships having double bottom wooden ceiling is fitted, it shall have a thickness as follows:
- at least 50 mm for ships of 60 m in length and less;
- at least 65 mm for ships over 60 m in length.

The application of the ceiling made from synthetic material is subject to special consideration by the Register in each case.

8.4.3 Where cargo is discharged by grabs or other mechanisms, the thickness of the wooden ceiling fitted under cargo hatchways is to be doubled.

8.4.4 In holds intended for carriage of grain and other bulk cargoes the wooden ceiling on the inner bottom or, in case the latter is omitted, on the top of floors, is to be fitted so as to prevent wells, bilges and suction pipes of the bilge system from clogging.

8.4.5 The wooden ceiling is not to be laid directly on the inner bottom metal plating, but is to be embedded in a bituminous or epoxy composition approved by the Register, or placed on battens of 25 — 30 mm in thickness along the floors. The wooden ceiling over the bilges is to be placed so as to be readily removable (see also 7.6.9, Part VIII "Systems and Piping").

8.4.6 It is recommended that the cargo battens made of wood or metal should be fitted on sides in holds and spaces intended for carriage of general cargoes. The thickness of wooden battens is to be as follows:

- at least 40 mm for ships of 70 m in length and less;
- at least 50 mm for ships of length exceeding 70 m.

The distance between adjacent battens is not to exceed 305 mm. The battens are to be attached to side framing so as to be readily removable and replaceable.

8.4.7 All projecting parts of various equipment in the holds (manholes, air pipes, sounding pipes, etc.) are to be protected with wooden screens, grids, chutes, etc. in places subject to impacts of cargoes,
grabs or other hoisting devices. Requirements for laying pipe lines in cargo holds are given in 5.3, Part VIII "Systems and Piping".

8.4.8 Cellular guide members for the carriage of containers in holds.

8.4.8.1 The requirements of 8.3.8 apply to the cellular guide members used for the carriage of containers, manufactured in accordance with Rules for the Construction of Containers, in the holds of cargo ships.

8.4.8.2 Cellular guide members comprise uprights and horizontal shores arranged breadthwise and lengthwise. In the holds, the cellular guide members may be removable or permanent.

8.4.8.3 Cellular guide members shall not be integrated in the hull structure. They are to be so designed that no stresses are exerted on them when the hull comes under bending or torsion.

8.4.8.4 Cellular guide members shall be designed to withstand stresses due to the forces $F_x$ and $F_y$, affecting the gravity centre of each container, which are to be determined from the formulae:

lengthwise

$$F_x = mga_x, \quad N,$$

breadthwise

$$F_y = mga_y, \quad N,$$

where $m$ = maximum gross mass of container, in kg; $g$ = gravity acceleration, $g = 9.81 \text{ m/s}^2$; $a_x$, $a_y$ = dimensionless accelerations to be determined in accordance with 1.6, the coordinates of $x$ and $z$ being determined up to the gravity centre of each container volume.

The forces $F_x$ and $F_y$ are to be determined for each container, and through the four relevant corner fittings of the end or wall they are uniformly distributed among the uprights. By way of simplification, maximum $F_x$ and $F_y$ values may be adopted for each container. Where a number of adjoining containers are supported by a pair of uprights, the $F_x$ and $F_y$ values for the particular container tier shall be summed up and distributed among the respective uprights.

Friction forces arising where the corner fittings of containers touch each other or the inner bottom are to be ignored.

8.4.8.5 The forces resultant from loads to be determined in accordance with 8.3.8.4, where the container corner fittings rest upon the uprights, shall not exceed 150 kN per fitting breadthwise or 75 kN per fitting lengthwise.

8.4.8.6 Where the attachment of uprights to the hull structures is not considered as firm fixing (free resting, flexible fixing, etc.), the cellular guide members shall be calculated as three-dimensional frames.

Where the attachment of uprights to the hull structures can be considered as firm fixing, particular vertical surfaces of cellular guide members may be calculated as plane frames.

The stresses in the cellular guide member components are not to exceed 0.8 times the upper yield stress of their material.

The terms of calculating the stability of cellular guide member components are to be found under 8.4.8.14.

8.4.8.7 In view of the requirements under 8.4.8.6, the displacement of the resting points of corner fittings upon the uprights is not to exceed 25 mm breadthwise or 10 mm lengthwise.

8.4.8.8 When determining the thickness of the uprights components, the thickness of those especially subject to wear shall be increased by 5 mm to equal 12 mm at least.

8.4.8.9 Where the uprights comprise separate angular sections, they are to be firmly secured to each other with horizontal plates at the resting points of container corner fittings and at least halfway between those points.

8.4.8.10 At the upper ends of the uprights, devices shall be fitted to facilitate the insertion of containers into the stowage frames.

8.4.8.11 Uprights shall, so far as possible without notches, be attached to transverse and longitudinal bulkheads by means of sheer- and bend-stiff members.

8.4.8.12 The total margin between the external scantlings of containers and the internal upright surfaces shall not exceed 25 mm breadthwise or 40 mm lengthwise.

When fitting the uprights, the deviation from the straight line shall not exceed 5 mm.

8.4.8.13 Transverse horizontal and longitudinal horizontal shores serve to connect the stand-alone uprights to each other and to secure them to vertical hull structures. The horizontal shores shall, as far as possible, be fitted on the level of the corner fitting rest points and be torsion- and bend-stiff connected to the uprights.

8.4.8.14 The stability of transverse horizontal and longitudinal horizontal shores and, where necessary, that of uprights shall be checked by a procedure approved by the Register.

When determining the permissible buckling stresses, the relevant safety factor may be adopted equal to 2.0.

The free length of buckling shall be adopted span-equal in the case of a bolted joint or 0.7 times the shore or uprights span in the case of a welded joint. The flexibility is not to exceed 250.

For other types of bar-end fixing, the free length is to be established on agreement with the Register.

8.4.8.15 The container rest points on the inner bottom and areas containing the connections and
8.4.9 Movable decks, platforms, ramps and other similar structures.

8.4.9.1 The requirements of 8.4.9 apply to the movable decks, platforms, ramps and other similar structures designed to be installed in two positions:

- in working position when they are used for carriage, loading or unloading of vehicles or other cargoes;
- in non-working position when they are not used for carriage, loading or unloading of vehicles or other cargoes.

8.4.9.2 The movable decks, platforms, ramps and other similar structures and also their supporting elements at ship's sides, decks and bulkheads, the pillars or suspensions for decks and platforms ensuring their proper installation in the working position shall be designed in accordance with the requirements of Part II "Hull".

8.4.9.3 Arrangements shall be provided for reliable securing of the movable decks, platforms ramps and other similar structures in the non-working position.

8.4.9.4 When the movable decks, platforms, ramps and other similar structures are secured in the non-working position, the hoisting gear and elements thereof shall not generally be kept under the load.

It is not permitted to secure the movable decks, platforms, ramps and other similar structures by suspending them on ropes.

8.4.9.5 The structural elements of the arrangements mentioned in 8.4.9.3 and also the associated supporting structures shall be designed to withstand the forces resulting form the application of the loads $P_x$, $P_y$, $P_z$, as obtained from the formulae given below, to the centres of gravity of the considered section of the deck, platform, ramp or other similar structures:

$$P_x = mga_x$$  \hspace{1cm} (8.4.9.5-1)

$$P_y = mga_y$$  \hspace{1cm} (8.4.9.5-2)

$$P_z = mg(1 + a_z)$$  \hspace{1cm} (8.4.9.5-3)

where

- $P_x$ = horizontal load parallel to the centre plane of the ship, N. Consideration shall be given to the cases when the load $P_x$ is directed both forward and aft;
- $P_y$ = horizontal load parallel to the midstation plane, N. Consideration shall be given to the cases when the load $P_y$ is directed both to the nearest ship's side and to the opposite side;
- $P_z$ = vertical load directed downward, N;
- $m$ = mass of the considered section of the deck, platform, ramp or other similar structure, kg;
- $g$ = acceleration due to gravity equal to 9.81 m/s$^2$;
- $a_x$, $a_y$, $a_z$ = dimensionless accelerations to be determined in accordance with 1.7.

8.4.9.6 When determining the forces affecting the structural elements of the arrangements specified in 8.4.9.3 and the associated supporting structures with regard to the provisions of 8.4.9.5, the loads $P_x$, $P_y$, and $P_z$ are regarded as separately applied, i.e. no account is taken of their combined action and of the frictional forces originating on the surfaces of the considered sections of decks, platforms, ramps or other similar structures which are in contact with the associated supporting structures.

8.4.9.7 When the structural elements of the arrangements specified in 8.4.9.3 and the associated supporting structures are under the effect of the loads determined according to the provisions of 8.4.9.5 and 8.4.9.6, the stresses in their parts shall not exceed 0.8 times the upper yield stress of material.

Under the effect of these loads the safety factor of the wire ropes in relation to their actual breaking strength shall be not less than 4; the safety factor of the chain cables in relation to the proof load of the chain shall be not less than 2; the margin of safety against buckling of the elements subjected to the compression stress shall be not less than 2.

8.4.9.8 Wire ropes used in the arrangements specified in 8.4.9.3 shall satisfy the requirements of 3.15 and chain cables, those of 7.1, Part XIII "Materials".

8.5 EXITS, DOORS, CORRIDORS, STAIRWAYS AND VERTICAL LADDERS

8.5.1 General.

Location and arrangement of exits, doors, corridors, stairways and vertical ladders are to ensure ready access of persons from spaces to the places of embarkation into lifeboats and liferafts.

8.5.2 Exits and doors.

8.5.2.1 In passenger ships and in special purpose ships each watertight compartment or similarly restricted space or group of spaces situated below the bulkhead deck shall have at least two means of escape, in any case one of which shall be independent of the door in the subdivision bulkhead.

Two means of escape should be provided from a machinery control room located within a machinery space, at least one of which will provide continuous fire shelter to a safe position outside the machinery space (See 2.1.4.5 and 2.2, Part VI "Fire Protection").

8.5.2.2 In passenger ships and in special purpose ships above the bulkhead deck each main vertical fire zone (see 1.2, Part VI "Fire Protection") or similarly restricted space or group of spaces shall have at least two means of escape one of which shall give access to a stairway forming a vertical means of escape to the places of embarkation into lifeboats and liferafts.
8.5.2.3 In passenger ships the number and location of means of escape from special category spaces (see 1.5.9. Part VI "Fire Protection") are subject to special consideration by the Register, and the degree of safety for escape from these spaces to the places of embarkation into lifeboats and liferafts shall at least correspond to that specified in 8.5.2.1 and 8.5.2.2.

For cargo ships in all ro-ro cargo spaces where the crew is normally employed the number and locations of escape routes to the open deck are subject to special consideration by the Register, but shall in no case be less than two and shall be widely separated.

8.5.2.4 In cargo ships of 500 gross tonnage and upwards at each level of accommodation spaces there shall be at least two means of escape, as widely separated as possible, from each restricted space or group of spaces; from the spaces situated below the open deck the main means of escape shall be formed by a stairway, the other means of escape may be formed by a casing with a vertical ladder or by a stairway; from the spaces situated above the open deck the means of escape shall be formed by doors of stairways leading to the open deck or combination thereof.

8.5.2.5 Exceptionally, the Register may dispense with one of the means of escape specified in 8.5.2.1 or 8.5.2.4, due regard being paid to the purpose and location of spaces and to the number of persons who normally might be quartered or employed there.

8.5.2.6 Stairways serving only a space and a balcony in that space, as well as lifts shall not be considered as means of escape specified in 8.5.2.1, 8.5.2.2 to 8.5.2.4 and 8.5.2.6.

8.5.2.7 Each cinema hall is to be provided with at least two means of escape. Both exits are to be spaced from each other as wide as practicable. A readily seen inscription "Exit" or "Emergency exit" is to be provided above every such exit.

8.5.2.8 The wheelhouse is to have two exits, one to each side of the navigation bridge, with a passageway through the house from side to side.

8.5.2.9 The total width of exits from cinema halls shall be determined on the basis of 0.8 m per 50 persons, however, the width of each exit shall be not less than 1.1 m, when the number of seats is more than 50, and not less than 0.8 m when the number of seats is not more than 50.

The width of each exit from accommodation and service spaces shall be not less than 0.6 m. The sizes of the ladderways from cargo holds shall be not less than 0.6 x 0.6 m.

8.5.2.10 The exit doors and ladderway covers are to be so arranged that they can be operated from both sides.

Doors are to open as follows:

.1 doors of accommodation and service spaces giving access to a corridor inside the spaces,
.2 doors of public rooms, outside or each side,
.3 doors in the end bulkheads of superstructures and in external transverse bulkheads of deckhouses, outside in the direction of the nearest side,
.4 doors in the external longitudinal bulkheads of deckhouses, outside in the forward direction.

In cargo ships the inner doors duplicating the doors specified in .3 and .4 may open inside the space.

In ships of 31 m in length and less the doors indicated in .1 may open outside (to the corridor) if they are situated at the end of blind corridors and do not hinder the exits from other spaces.

No sliding doors are to be fitted at exits and means of escape, except for doors of the wheelhouse.
The doors referred to in .1 shall not be provided with hooks for holding the door open. It is permitted that such doors be fitted with buffers and spring catchers to fix the door in the open position and to allow for its closure without entering the space.

8.5.2.11 Doors of accommodation spaces specified in 1.5.2.1 and 1.5.2.2, Part VI "Fire Protection" are to have in their lower portions detachable panels 0.4 x 0.5 m in size, these panels of the passenger cabin doors shall be provided with the following inscription: "Means of escape — knock out in case of emergency".

The detachable panels need not be fitted where the spaces are provided with opening type side scuttles of at least 400 mm in diameter of windows the smaller side of which being at least 400 mm and on condition that persons may get to the corridor or open deck through these side scuttles or windows. The appropriate means shall be provided, if necessary, to facilitate exit through side scuttles or windows.

8.5.3 Corridors and passageways.

8.5.3.1 All corridors and passageways are to ensure free movement of persons along them. On passenger ships and special purpose ships carrying more than 50 special personnel, a lobby, corridor or part of a corridor should have more than one means of escape.

Cargo ships and special purpose ships carrying not more than 50 special personnel should have no dead-end corridors more than 6 m long. By a dead-end corridor, a corridor or part of a corridor is meant which has only one means of escape.

8.5.3.2 The width of main corridors in way of passengers' and crew's accommodation spaces is not to be less than 0.9 m, and that of side corridors is to be at least 0.8 m. Where the number of passengers and crew using the corridor surpasses 50 persons, the widths referred to above are to be increased by 0.1 m.

In ships (including the tugs) below 500 gross tonnage and in tugs of less than 370 kW the width of
the main corridors and side corridors may be reduced down to 0.8 and 0.6 m, respectively.

8.5.3.3 The widths of passageways in the cinema hall and in the entrance hall are not to be less than 1.1 m and 1.4 m, respectively.

The width of the main passageways in the restaurant or dining room and also the messroom is not to be less than 0.9 m and that of the side passageways is to be at least 0.65 m. In ships of less than 500 gross tonnage the width of main passageways in the messroom may be reduced down to 0.65 m.

8.5.3.4 The width of the main passageway in the seating passenger space is to be at least 1 m with number of passengers up to 50 and at least 1.1 m with number of passengers in excess of 50.

8.5.3.5 In passenger ships the main corridors adjacent to engine and boiler casings are to be at least 1.2 m in width, however, in ships of less than 500 gross tonnage this width may be reduced down to 0.9 m.

8.5.3.6 The width of passageway on the bridge is not to be less than 0.8 m in ships of 500 tons gross tonnage and over and at least 0.6 m in ships of less than 500 gross tonnage.

8.5.3.7 In passenger ships and special purpose ships the width of the deck passageways providing access to the lifeboat and liferaft embarkation deck is not to be less than:

- 0.9 m if the number of seats in lifeboats is not more than 50 on each side of ship;
- 1.0 m if the number of seats in lifeboats is 50 and over, but less than 100 on each side of ship;
- 1.2 m if the number of seats in lifeboats is 100 and over, but less than 200 on each side of ship.

If number of seats in lifeboats is 200 and over on each side of ship, the width of the passageways will be specially considered by the Register in each case.

In other ships the width of the passageways referred to above is not to be less than 0.8 m.

8.5.4 Stairways and vertical ladders.

8.5.4.1 All between deck stairways shall be of steel frame construction or of equivalent material on agreement with the Register (see 1.2, Part VI "Fire Protection"). Special requirements for arrangement of stairway enclosures and protection of means of escape are specified in 2.1.4.3, 2.1.4.5, 2.2.2.4, and Table 3.1.2.1, Part VI "Fire Protection".

8.5.4.2 On passenger ships and special purpose ships carrying more than 50 special personnel, the following conditions are to be met:

- The width of stairways should be not less than 900 mm, with handrails on each side.

The minimum width of stairways is to be increased by 10 mm for every one person in excess of 90 persons.

The maximum width between handrails where stairways are wider than 900 mm is to be 1800 mm. The total number of persons to be evacuated by such stairways should be assumed to be two-thirds of the crew and the total number of passengers in the areas served by such stairways.

- All stairways sized for more than 90 persons are to be aligned fore and aft.

- The dooryards, corridors and intermediate landings included in means of escape should be sized in the same manner as stairways.

- Stairways should not exceed 3.5 m in vertical rise without the provision of a landing and should not have an angle of inclination greater than 45°.

- Landings at each deck level should not be less than 2 m² in area and should increase by 1 m² for every 10 persons provided for in excess of 20 persons but need not exceed 16 m², except for those landings servicing public spaces having direct access onto the stairway enclosure.

- In any case, the stairway width is to be in accordance with the requirements of the Appendix to this Part of the Rules.

8.5.4.3 For cargo ships, the stairway width should be determined on the basis of instructions to be found in para 3 of the Appendix to this Part. In any case, the stairway width is not to be less than the corridor width specified in 8.5.3.2.

8.5.5 Low location lighting (LLL) on passenger ships carrying more than 36 passengers and special purpose ships carrying more than 200 special personnel.

8.5.5.1 In addition to the emergency lighting stipulated by 19.1.2, Part XI "Electrical Equipment", the means of escape, including stairways and exits, of passenger ships carrying more than 36 passengers and special purpose ships carrying more than 200 special personnel shall be marked by LLL at all points of the escape route including angles and intersections.

8.5.5.2 Provision shall be made for the following LLL systems:

- A photoluminescent system which uses photoluminescent material containing a chemical (example: zinc sulfide) that has the quality of storing energy when illuminated by visible light (see also 6.7, Part XIII "Materials");

- Electrically powered systems which use incandescent bulbs, light emitting diodes, electroluminescent strips or lamps, electrofluorescent lamps, etc. (see also 19.1.4, Part XI "Electrical Equipment").

8.5.5.3 The LLL system shall function at all times for at least 1 hour after its activation. All systems, including those automatically activated or continuously operating, are to be capable of being manually activated by a single action from the central control station.
8.5.5.4 In all passageways, the LLL should be continuous except as interrupted by corridors and cabin doors in order to provide a visible delineation along the escape route. The LLL should be installed at least on one side of the corridor, either on the bulkhead within 300 mm of the deck, or on the deck within 150 mm of the bulkhead. In corridors more than 2 m wide, LLL should be installed on both sides. In dead-end corridors, LLL should have arrows placed at intervals of no more than 1 m, or equivalent direction indicators, pointing away from the dead-end.

8.5.5.5 In all stairways, LLL should be installed on at least one side at a height less than 300 mm above the steps. LLL should be installed on both sides if the width of the stairway is two metres or more. The top and bottom of each set of stairs should be identified to show that there are no further steps.

8.5.5.6 In all passenger cabins, a placard explaining the LLL system should be installed on the inside of the cabin door. It should also have a diagram showing the location of, and the way to, the two closest exits with respect to the cabin.

Materials used in the manufacture of LLL products should not contain radioactive or toxic materials.

8.5.5.7 LLL signs shall be also provided at all doors and means of escape. The signs shall be located at a height of 300 mm above the deck or the bottom of the door and be contrast in colour to the background on which they are marked.

All exit door and escape route signs shall be of photoluminescent materials or marked appropriately by lighting.

8.5.6 Additional requirements for means of escape on ro-ro passenger ships.

8.5.6.1 Handrails or other handholds shall be provided in all corridors along entire escape route, so that a firm handhold is available every step of the way, where possible, to the assembly stations and embarkation stations. Such handrails shall be provided on both sides of longitudinal corridors more than 1.8 m in width and transverse corridors more than 1 m in width. Particular attention shall be paid to the need to be able to cross lobbies, atriums and other large open spaces along escape routes. Handrails and other handholds shall be of such strength as to withstand a distributed horizontal load of 750 N/m applied in the direction of the centre of the corridor or space, and a distributed vertical load of 750 N/m applied in downward direction. There is no need to apply the two loads simultaneously.

8.5.6.2 Means of escape shall not be obstructed by furniture and other obstructions, with the exception of tables and chairs which may be cleared away to provide open space. Cabinets and other heavy pieces of furniture in public spaces and along escape routes shall be secured in place to prevent shifting if the ship rocks or lists. Floor coverings shall also be secured in place. When the ship is underway, means of escape shall be kept clear of obstructions.

8.5.6.3 Means of escape shall be provided from every normally occupied space on the ship. These means of escape shall be arranged so as to provide the shortest route possible to the assembly stations and survival craft embarkation stations and shall be marked with appropriate symbols.

8.5.6.4 Where enclosed spaces adjoin an open deck, openings from the enclosed space to the open deck shall, where it is practicable, be capable of being used as an emergency exit.

8.5.6.5 Decks shall be sequentially numbered, starting with "1" at the tank top or the lowest deck. These numbers shall be prominently displayed at stair landings and lifts in the lobbies. Decks may also be named, but the deck number shall always be displayed along with the name.

8.5.6.6 Simple and clear plans showing the "you are here" position and means of escape marked by arrows shall be prominently displayed on the inside of each cabin door and in public spaces.

8.5.6.7 Cabin and stateroom doors shall not require keys to be unlocked from the inside. Neither shall there be any doors along any designed escape route which require keys to be unlocked.

8.5.6.8 The lowest 0.5 m of bulkheads along escape routes shall be able to sustain a load of 750 N/m to allow them to be used as walking surfaces with the ship at large angles of heel.

8.5.6.9 The escape routes from cabins to stairway enclosures shall be as direct as possible, with a minimum number of direction changes. It shall not be necessary to cross from one side of the ship to the other to reach means of escape. It shall not be necessary to climb more than two decks up or down to reach an assembly station or open deck from any passenger space.

8.5.6.10 External means of escape to the survival craft embarkation stations shall be provided from all open decks, referred to in sub-paragraph 8.5.6.9.

8.6 GUARD RAILS, BULWARK AND GANGWAYS

8.6.1 All exposed parts of the freeboard decks, superstructure decks and deckhouse tops are to be provided with efficient guard rails or bulwarks; in case of ships intended for carriage of timber deck cargo collapsible railing or storm rails are to be fitted on this cargo.

8.6.2 The height of the bulwark or guard rails above the deck is not to be less than 1 m. However, where this height would interfere with the normal
operation of the ship, a lesser height may be approved provided the adequate protection of passengers and crew is ensured to the satisfaction of the Register.

8.6.3 The distance between the stanchions of the guard rails shall be not more than 1.5 m. At least every third stanchion shall be supported by a stay.

Removable and hinged stanchions shall be capable of being locked in the upright position.

8.6.4 The gunwale, hand rails and guard rails shall be generally of rigid construction; wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths; wire ropes shall be made taut by means of turn-buckles.

Lengths of chains may only be accepted in lieu of rigid guard rails if they are fitted between two fixed stanchions or between the fixed stanchion and bulwark.

8.6.5 The opening below the lowest course of the guard rails is not to exceed 230 mm. The other courses of rails are not to be more than 380 mm apart. An exception is made for the guard rails above the timber deck cargo where the height from the base to the lowest course and other course spacings are not to exceed 330 mm. In the case of ships with rounded gunwale, the guard rail supports are to be placed on the flat of the deck.

8.6.6 Type "A" ships with bulwarks as well as type "B" ships with a freeboard reduced to that required for type "A" ships are to have open rails fitted for at least half the length of the exposed parts of the weather deck, or other effective water freeing arrangements. The upper edge of the sheerstrake is to be kept as low as practicable.

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

8.6.7 The bulwark, if arranged, is to comply with the requirements of 2.14, Part II "Hull".

8.6.8 Satisfactory means (in the form of life lines, gangways, underdeck passages, etc.) are to be provided for the protection of the crew in getting to and from their quarters, the machinery space and all other parts used in the necessary work of the ship.

8.6.9 A fore and aft permanent gangway is to be provided on type "A" ships at the level of the superstructure deck between the poop and the midship superstructure or deckhouse, where fitted, or equivalent means of access are to be provided to carry out the purpose of the gangway, such as underdeck passages.

The width of the passages is to be not less than 1 m. The gangways over the entire length of the plating on either side are to be fitted with longitudinal guarding bars. Reliable guard rails, the dimensions of which are to comply with the requirements of 8.6.2, 8.6.3 and 8.6.5 of this Part, and 3.5.5.2, Part II "Hull" are to be provided.

The gangways are to be constructed of a fire-resisting material, and the plating is to be made, in addition, of a nonslip material.

In ships not having a midship superstructure arrangements to the satisfaction of the Register are to be made to safeguard the crew in reaching all parts of the ship while at sea.

8.6.10 Safe and convenient ladders from the level of the gangways to the deck are to be provided; they are not to be spaced more than 40 m apart.

Where the length of the deck is more than 70 m, special shelters are to be provided along the gangways or other means of access for protection of the crew from bad weather. Such shelters are to be designed for at least one person and are to be spaced not more than 45 m apart. Pipes or other deck equipment are not to impede safe passage.

8.6.11 Requirements of 8.6.1 — 8.6.5 and 8.6.9 are not applied to the shipborne barges. In such case, at least guard rails are to be provided.

8.7 HOISTING GEAR OF SHIPBORNE BARGES

8.7.1 The elements of the hoisting gear of the shipborne barges to be lifted by the crane on board the barge carrier (hulls, eye plates, rings, shackles, grips, etc.) are to be designed to withstand the forces resulting from lifting the shipborne barge uniformly loaded with the specification cargo and gripped in two points diagonally positioned. Under these forces the stresses in the elements of the hoisting gear are not to exceed 0.7 times the upper yield stress of material.

9 EMERGENCY OUTFIT

9.1 GENERAL PROVISIONS

9.1.1 The items listed in Tables 9.2.1, 9.2.2-1, 9.2.2-2 and 9.2.3 available in the ship, but intended for other purposes may be included into the emergency outfit, provided these items have corresponding markings and their permanent storage places are situated above the bulkhead deck.

### 9.2 ITEMS REQUIRED

#### 9.2.1 For the unmanned non-self-propelled ships

No emergency outfit is required. The manned non-self-propelled ships are to be supplied with the emergency outfit in accordance with 9.2.10 like floating docks with no permanent direct communication with the shore.

#### 9.2.2 Additional set of emergency outfit, above that listed in Table 9.2.1, shall be provided:

In accordance with Table 9.2.2-1 for passenger and special purpose ships, of $70$ m in length and over, except those of glass-reinforced plastics;
in accordance with Table 9.2.2-2 for glass-reinforced plastic ships.

**9.2.3** The sets of rigging and fitter’s tools specified in Table 9.2.1 are to be completed according to Table 9.2.3.

**9.2.4** For ships of restricted areas of navigation I and II, except those specified in 9.2.5, equipment with emergency outfit and materials may be laid down as for the nearest lower group of ship’s division depending on their length according to Table 9.2.1.

The minimum amount of emergency outfit for ships of restricted area of navigation III will be specially considered by the Register in each case.

**9.2.5** For ships with ice strengthening of JY5, JY6, JY7, JY8 and JY9 categories, equipment with emergency outfit and materials are to be established as for the nearest higher group of ship’s division according to their length as per Table 9.2.1.

**9.2.6** For glass-reinforced plastic ships provision of emergency outfit listed under 6, 9, 17, 21 to 24, 26 to 29, 31, 35, 36, 39, and 40 of Table 9.2.1 is not required.

**9.2.7** In ships intended to carry flammable and explosive cargoes tools of emergency outfit are to be made of sparkless materials wherever practicable.

**9.2.8** The tugs of restricted area of navigation III need not be equipped with emergency outfit, except for the sets of rigging and fitter’s tools required in accordance with Table 9.2.3.

**9.2.9** For tugs of unrestricted service and restricted area of navigation I with ice strengthening of JY5 category equipment with emergency outfit and materials shall be established as for the nearest higher group according to Table 9.2.1.

**9.2.10** The floating docks which are not in permanent direct communication with the shore shall have emergency outfit as indicated under items 5, 6, 19 to 26, 32 to 34 and 37 of Table 9.2.1, length of the floating dock _L_ being taken in this case instead of the ship’s length _L_.

The floating docks which are in permanent direct communication with the shore need not be provided with emergency outfit.

**9.2.11** For berth-connected ships, the emergency outfit is to be chosen by the owner.

**9.2.12** Ships having a distinguishing mark Π1, Π1B, Π2, Π2B and Π3B in the class notation are to have two searchlights capable of providing an efficient horizontal and vertical range of illumination of a surface not less than 10 m in diameter at a distance up to 250 m at the minimum illumination intensity up to 50 lx at dark time and clear atmosphere.

### 9.3 STORAGE OF EMERGENCY OUTFIT

**9.3.1** The emergency outfit indicated in 9.2 shall be stored at least in two emergency stations, one of which shall be situated in the machinery space. Emergency stations may be special spaces, boxes or places allocated on the deck or in spaces. In the emergency station of the machinery space the outfit necessary for carrying out the emergency operations inside the space shall be stored; the rest of the
emergency outfit shall generally be stored in the emergency stations located above the bulkhead deck; in ships of less than 45 m in length it is allowed to locate the emergency station below the bulkhead deck on condition that free access to this station is provided at all times.

In ships of 31 m in length and below it is allowed to store the emergency outfit only in one emergency station.

**9.3.2** A free passage shall be provided in front of the emergency station; the passage width shall be selected depending on the overall dimensions of the outfit stored in the station but not less than 1,2 m. In ships of less than 70 m in length the passage width is allowed to be reduced to 0,8 m and in ships of 31 m in length and below to 0,6 m.

The passages to the emergency stations shall be as straight and short as practicable.

**9.4 MARKING**

**9.4.1** Items of the emergency outfit and cases for their storage (apart from collision mats) are to be painted blue either entirely or in a stripe. The cases for emergency equipment storage shall have the distinct inscription to indicate the name of the material, weight and warranted storage period.

**9.4.2** The emergency stations are to be provided with distinct inscriptions "Emergency Station". Moreover, in the passages and on the decks notices shall be posted showing location of the emergency stations.

**9.5 COLLISION MATS**

**9.5.1** Collision mats are to be made of water-resistant canvas or other equivalent fabric and be provided with either a soft or wire interlayer depending on the type of the collision mat. The collision mats are to be edged by a leech rope with four thimbles fitted into its corners. Moreover, cringles are to be provided according to the number of ropes specified in Table 9.5.1.

**9.5.2** The pads are to be made of natural fibre rope strands and be thrummed with natural fibre spun yarn. A canvas shall be sewn on the bottom side of the pad.

**9.5.3** Sheets and guys of armoured collision mats shall be made of flexible steel wire ropes, control lanyards — of natural fibre ropes and hogging lines for all collision mats — of flexible steel wire ropes or chains having suitable diameter. Wires of steel ropes shall have heavy zinc coating in accordance with the national standards.

The length of the sheets is to be chosen so that a hole may be shut up in any place of the shell plating and the ends of the ropes may be efficiently secured on the deck.

The actual breaking load of the whole sheets is to exceed that of the leech ropes by not less than 25 per cent.

**9.5.4** The blocks of emergency outfit may have hooks as hangers. The permissible load of the shackles joining the ropes is not to be less than 0,25 times the actual breaking load of the whole ropes referred to above.

</table>
10 ANCHORS

10.1 MANUFACTURE

10.1.1 Anchors may be of forged, cast or welded construction.

10.1.2 Anchor parts are to be free from cracks, cavities and other defects affecting the strength of the parts. The external defects may be repaired by electric welding. Welding procedure is to be agreed with the Register.

10.1.3 The pins of the heads shaft and the pin of the anchor shackle are to be efficiently locked against axial displacement. The locking may be effected by electric welding.

10.1.4 The necessity of heat treatment of the anchors after their manufacture as well as heat treatment conditions are defined by the manufacturer. Heat treatment, if the anchors are subjected to it, is to be performed before testing.

10.2 TESTING

10.2.1 All cast or welded anchors or their parts are to be tested by dropping on a steel plate not less than 100 mm in thickness. The height of dropping is given in Table 10.2.1.

<table>
<thead>
<tr>
<th>Anchor mass m, kg</th>
<th>Height of dropping (measured from plate up to lower edge of anchor or its part), m</th>

</tr>
</tbody>
</table>

The heads of Hall’s, Gruson’s and high holding power anchors are dropped on the plate the crown downwards; the shanks of Hall’s, Gruson’s and high holding power anchors and also the shanks with the flukes of admiralty stocked anchor are dropped in horizontal position.

10.2.2 Moreover, each cast or welded shank with flukes of the admiralty stocked anchor is to be suspended in a vertical position, the flukes downwards, and dropped on two steel blocks put on the plate in such a manner that the distance between them is half the span of the flukes (Fig. 10.2.2). The thickness of the blocks is to be such as to prevent the anchor crown from striking against the plate.

10.2.3 After the drop test the anchors or their parts are to be suspended and subjected to a hammer test with a hammer having mass of not less than 3 kg. They must give out a clear ringing sound.

10.2.4 Anchor shackles should be tested together with the anchors. When tested by proof load, no fractures or permanent deformation should be detected.

10.2.5 Each anchor, irrespective of the method of its manufacture, shall be subjected to tensile test by application of a proof load either on a chain testing machine or by a load suspended to the flukes.

10.2.6 Hall’s, Gruson’s and high holding power anchors are to be tested by simultaneous gripping of both flukes (Fig. 10.2.6), first turned to one side and then to the other.

10.2.7 The admiralty stocked anchors are to be tested by applying the load to each fluke in succession (Fig. 10.2.7). The test may be carried out both with or without the stock.
10.2.8 In all cases, the proof load is applied on one side to the statutory shackle and on the other side to flukes (Hall’s, Gruson’s and high holding power anchors) or fluke (admiralty stocked anchors) at a distance of one-third of the fluke length \( l \), apart from the bill (see Figs 10.2.6 and 10.2.7).

10.2.9 The value of the proof load \( F_1 \) which the anchor shall withstand is not to be less than that specified in Table 10.2.9.

10.2.10 Prior to the proof testing, a punch mark is to be made on the anchor shank and also on each bill of flukes. Then Hall’s Gruson’s and high holding power anchors are subjected to a preliminary 5-minute tension by a load equal to 0.5\( F_1 \).

The load is then reduced down to 0.1\( F_1 \) and the distances between the punch marks are measured. After this the load is increased to the proof test value and maintained during 5 min. Then the load is

</table>

Notes: 1. Proof load for intermediate values of the anchor mass is determined by linear interpolation.
2. For high holding power anchors the proof load is taken depending on the anchor mass increased by 35 per cent.
reduced to 0.1F₁ and the distances between the punch marks are measured again.

If the increase of the distance between the punch marks exceeds 0.5 per cent of the initial distance, the anchor will be rejected.

The admiralty stocked anchors are not subjected to the preliminary tension. The distance between the punch marks is measured before and after the application of the proof load which is to be applied during 5 min. No residual deformation is allowed.

10.2.11 After Half's, Gruson's and high holding power anchors have been subjected to the proof load, the free rotation of their flukes through the complete angle is to be controlled. In case the rotation of the flukes is impeded or they rotate through an incomplete angle, the defects shall be found and eliminated and the test repeated. The results of the repeated test are considered final.

APPENDIX

CALCULATION OF THE WIDTH OF STAIRWAYS FORMING MEANS OF ESCAPE ON PASSENGER SHIPS AND ON SPECIAL PURPOSE SHIPS CARRYING MORE THAN 50 SPECIAL PERSONNEL

1. The calculation method considers evacuation from enclosed spaces within each main vertical zone individually and takes into account all of the persons using the stairway enclosures in each zone, even if they enter that stairway from another main vertical zone.

2. For each main vertical zone the calculation should be completed for the night time (case 1) and day time (case 2) and the largest dimension from either case used for determining the stairway width for each deck under consideration.

3. For multi-deck ships, the total stairway width W, in mm, which allows for the timely flow of persons evacuating from adjacent decks is determined using the following calculation method:

   when joining two decks:
   \[ W = (N₁ + N₂) \times 10; \]  
   when joining three decks:
   \[ W = (N₁ + N₂ + 0.5N₃) \times 10; \]  
   when joining four decks:
   \[ W = (N₁ + N₂ + 0.5N₃ + 0.25N₄) \times 10 \]  

   where \( N₁ \) = the number of persons to be evacuated from deck with the largest number of persons using the stairway;
   \( N₂ \) = the number of persons to be evacuated from the deck with the next largest number of persons directly entering the stairway etc., i.e. \( N₁ > N₂ > N₃ > N₄ \).

   When joining five or more decks, the total stairway width should be determined from formula (3-3) with regard for the number of tiers and their capacity (see Fig. 3.1).

![Fig. 3.1. Minimum stairway width calculation example](image-url)

Deck 7
- Muster station
- N = 200

Deck 6
- N = 283

Deck 5
- N = 418

Deck 4
- N = 425

Deck 3
- N = 58

Deck 2
- N = 200

Deck 1

Deck 1: \( N₁ = 200, \ W = 200 \times 10 = 2000; \)
Deck 2: \( N₁ = 200, \ N₂ = 50, \ W = (200 + 50) \times 10 = 2500; \)
Deck 3: \( N₁ = 200, \ N₂ = 158, \ N₃ = 50, \ W = (200 + 158 + 0.5 \times 50) \times 10 = 3830; \)
Deck 4: \( N₁ = 425, \ N₂ = 200, \ N₃ = 158, \ N₄ = 50, \ W = (425 + 200 + 0.5 \times 158 + 0.25 \times 50) \times 10 = 7165; \)
Deck 5: \( N₁ = 425, \ N₂ = 419, \ N₃ = 158, \ N₄ = 50, \ W = (425 + 419 + 0.5 \times 158 + 0.25 \times 50) \times 10 = 9055; \)
Deck 7: \( N₁ = 200, \ W = 900. \)
The calculated value of $W$ may be reduced where available landing area is provided in stairways at the deck level (Fig. 3.2).

![Diagram](image)

Fig.3.2 Landing calculation for stairway width reduction:

1 - handrail on both sides of the stairway;
2 - intermediate landing;
3 - necessary flow area for accessing the flow on the stairs;
4 - door area

$P = S \times 3$ persons/m$^2$ = the number of persons taking refuge on the landing to a maximum of $P = 0.25Z$;

$N = Z - P$ = the number of persons directly entering the stairway flow from a given deck;

$S$ = the number of persons to be evacuated from the deck considered;

$D$ = width of exit doors to the stairway landing area (mm).

The doors to the muster station should have an aggregate width of at least $D = 900 + 9355 = 10255$.

4. The stairway width should not decrease in width in the direction of evacuation to the muster station, except in the case of several muster stations in one main vertical zone the stairway width should not decrease in the direction of the evacuation to the most distant muster station.

5. Where the passengers and crew are held at a muster station which is not at the survival craft embarkation position the dimensions of stairway width and doors from the muster station to this position should be based on the number of persons in the controlled groups. The width of these stairways and doors need not exceed 1500 mm unless larger dimensions are required for evacuation from these spaces under normal conditions.

6. The calculations of stairway width should be based upon the crew and passenger load on each deck. For the purpose of the calculation the maximum capacity of a public space should be defined by either of the following two values: the number of seats or similar arrangements, or the number obtained by assigning 2 m$^2$ of gross deck surface area to each person.

7. The dimensions of the means of escape should be calculated on the basis of the total number of persons expected to escape by the stairway and through doorways, corridors and landing (Fig. 7.1).

![Diagram](image)

Fig.7.1 Occupant loading calculation example:

1 - public space;
2 - landing credit area;
3 - door area;
DOWN, UP = stairway flow path

for upper space:

$Z_{(pers.)} = \frac{25 \text{ m} \times 8 \text{ m}}{2 \text{ m}^2} = 100$; $N_{(pers.)} = 100 - 0.75 = 75$;

for lower space:

$Z_{(pers.)} = \frac{25 \text{ m} \times 10 \text{ m}}{2 \text{ m}^2} = 125$; $N_{(pers.)} = 125 - 0.75 = 93$.

Calculations should be made separately for the two cases of occupancy of the spaces specified below. For each component part of the escape route, the dimension taken should not be less than the largest dimension determined for each case:
Case 1:
Passengers in cabins with maximum berthing capacity fully occupied;
members of the crew in cabins occupied to 2/3 of maximum berthing capacity;
service spaces occupied by 1/3 of the crew.

Case 2:
Passengers in public spaces occupied to 3/4 of maximum capacity;
members of the crew in public spaces occupied to 1/3 of maximum capacity;
service spaces occupied by 1/3 of the crew;
crew accommodation occupied by 1/3 of the crew.

8. The maximum number of persons contained in a vertical zone including persons entering stairways from another main vertical zone should not be assumed to be higher than the maximum number of persons authorized to be carried on board for the calculation of the stairway width only.

ADDITIONAL REQUIREMENTS

1. The aggregate width of stairway exit doors to the muster station should not be less than the aggregate width of stairways serving this deck.

2. Means of escape plans should be provided indicating the following:
   1. the number of crew and passengers in all normally occupied spaces;
   2. the number of crew and passengers expected to escape by the stairway and through doorways, corridors and landing;
   3. muster stations and survival craft embarkation positions;
   4. primary and secondary means of escape;
   5. width of stairways, doors, corridors and landing areas.

3. Means of escape plans should be accompanied by detailed calculations for determining the width of escape stairways, doors, corridors and landing areas.
1 GENERAL

1.1 APPLICATION

1.1.1 The present Part of the Rules applies to decked ships\(^1\) sailing in displacement condition. As to hydrogliders and sailing ships navigating under sails the requirements of this Part apply to them as far as it is reasonable and practicable.

1.1.2 This Part of the Rules applies to ships in service as far as it is reasonable and practicable, but it is, however, compulsory for ships which undergo reconstruction, major repair, alteration or modification if their stability is impaired as a result.

Stability of ships under 20 m in length after reconstruction, major repair, alteration or modification is to comply either with the requirements of this Part or with the requirements applied to such ships before reconstruction, major repair, alteration or modification.

1.1.3 The requirements set forth in this Part of the Rules do not extend to the light-ship condition, except for the provisions given in 2.3.1.

1.2 DEFINITIONS AND EXPLANATIONS

Definitions and explanations concerning the general terminology of the Rules are given in General Regulations for the Supervision and in Part I "Classification".

For the purpose of the present Part of the Rules the following definitions have been adopted:

Moulded depth is the vertical distance measured amidships from the top of plate keel or from the point where the inner surface of shell plating abuts upon the bar keel to the top of the beam of the uppermost continuous deck, i.e. of the deck below which the volume of the ship's hull is taken into account in stability calculations. In ships having a rounded gunwale, the moulded depth is measured to the point of intersection of moulded lines of the uppermost continuous deck and side, the lines extending so as if the gunwale were of angular design. If the uppermost continuous deck is stepped and the raised part of the deck extends over the point at which the moulded depth is to be determined, the moulded depth shall be measured to a line of reference extending from the lower part of the deck along a line parallel with the raised part.

---

\(^1\) In Section 1 of the present Part of the Rules the term "ship" also includes a floating crane, dock, pontoon and berth-connected ship, unless expressly provided otherwise.
Passage is navigation of a ship outside the prescribed area of navigation.

Voyage is navigation of a ship within the prescribed area of navigation.

Wing area is the projected lateral area of the above-water portion of the ship (except for floating crane) on the centre line plane with the ship in the upright position.

Deckhouse is a decked structure on the upper deck or superstructure deck with its side plating, on one side at least, being inboard of the shell plating by more than 4 per cent of the greatest breadth of the ship measured amidships to the outside of frames and having doors, windows and other similar openings in external bulkheads.

Lightship is a fully ready ship less deadweight. Water ballast is included in the deadweight.

A pontoon is a non-self-propelled vessel unmanned and designed to carry only deck cargo and having no hatchways in the deck, except small manholes closed with gasketed covers.

A hopper dredger is a ship extracting spoil by any appliances and having a hopper for its transportation.

Angle of flooding is the angle of heel at which the ship’s interior spaces are flooded by water through openings considered to be open or openings which may be opened as required by operation conditions of the ship in working position.

Breadth of ship is the maximum breadth measured on the summer load line from outside of frame to outside of frame in a ship with metal shell and to the outer surface of the hull in a ship with the shell of any other material.

For the purpose of the present Part of the Rules the following explanations have been adopted:

Amplitude of roll is an assumed rated amplitude of roll.

Hydrostatic curves are curves of the ship’s lines plan particulars.

Wind pressure is an assumed rated pressure of wind.

Diagram of limiting moments is a diagram of limiting statical moments, on the abscissa of which ship’s displacement, deadweight or draught is plotted and on the ordinate, limiting values of the vertical statical moments of masses meeting the complex of various requirements of this Part of the Rules for ship’s stability.

Inclining Test Instructions are instructions for determination of the ship’s displacement and position of the centre of gravity from the inclining test.

Instructions for Free Surfaces are instructions for taking into account the effect of free surfaces of liquid cargoes on ship’s stability.

Information is Information for the master (stability booklet).

Heeling moment due to wind pressure is an assumed rated moment caused by wind pressure.

Amidships is at the middle of the ship’s length.

Capsizing moment is an assumed rated minimum heeling moment dynamically applied.

Correction for free surfaces is a correction allowing for a decrease in the ship’s stability due to the effect of free surfaces of liquid cargoes.

A special facility is a system permanently installed in the ship for rapid estimation of her initial stability (e.g. heeling tanks with angle-of-inclination indicators) and approved by the Register for measurement of angles of inclination during the inclining test.

Universal diagram is a diagram of ship’s stability with a non-uniform scale of abscissae proportional to the heeling angle sines, a set of curves for arms of the form stability for various displacements and a scale of metacentric heights (or of heights of the ship’s centre of gravity) along the axis of ordinates for constructing straight half-lines determining the weight stability.

Various symbols used in this Part of the Rules are given in the Table (see p. p. 324 — 325).

1.3 SCOPE OF SUPERVISION

1.3.1 General provisions pertaining to the procedure of classification, construction supervision and classification surveys, as well as the requirements for the technical documentation submitted to the Register for consideration and approval are contained in General Regulations for the Supervision and Part I "Classification".

1.3.2 For every ship meeting the requirements of this Part of the Rules, the Register shall carry out the following:

.1 prior to the commencement of ship’s construction: consideration and approval of technical documentation relating to ship’s stability;

.2 during ship’s construction conversion and trials: supervision of the inclining test; consideration and approval of the Information on Stability;

.3 during special surveys for the purpose of class renewal and after repair or modernization;

inspections to check for changes in the light-ship condition in order to conclude whether the Information on Stability is still applicable;

for passenger ships, determination of light-ship weight experimentally at intervals not exceeding five years.
1.4 GENERAL TECHNICAL REQUIREMENTS

1.4.1 All calculations shall be made by the methods generally accepted in naval architecture. When using a computer, the methods of computation and programme shall be approved by the Register.

1.4.2 Calculation of form stability.

1.4.2.1 Arms of form stability shall be calculated for the waterline parallel to the design waterline.

For ships operating with permanent considerable initial trim, arms of form stability shall be calculated with due regard for this trim upon agreement with the Register.

If the shape and structure of a ship are such that the righting moment is considerably affected by the trim accompanying the inclinations, then the arms of form stability should be calculated with due regard for this trim.

1.4.2.2 When calculating the arms of form stability, full account may be taken of those tiers of superstructure which:

.1 meet the requirements of 7.5.1.2, Part III "Equipment, Arrangements and Outfit" for the first tier of superstructure (counting from the freeboard deck); side scuttles as concerns the efficiency of their closures shall be in compliance with 7.2.1.3 to 7.2.1.5 of the said Part;

.2 have an access for the crew from the above deck to the working spaces inside these superstructures, as well as to the machinery space by other means during the whole period when the openings in the superstructure bulkheads are closed.

If a midship bridge or poop complies with the requirements of 7.5.1.2, Part III "Equipment, Arrangements and Outfit", but the doors in their bulkheads provide the only exits to the deck, and the upper edge of the sills of the superstructure doors in a fully loaded ship immerses at a heeling angle less than 60°, the effective height of superstructures shall be assumed to be half their actual height and the superstructure doors assumed to be closed. If the upper edge of the door sills of a fully loaded ship immerses at a heeling angle equal to or over 60°, its effective height above the freeboard deck is taken to be its actual height.

1.4.2.3 When calculating the arms of form stability, account may also be taken of those tiers of deckhouse which:

.1 meet the requirements of 7.5.1.2, Part III "Equipment, Arrangements and Outfit" for the first tier of deckhouse (counting from the freeboard deck); side scuttles as concerns the efficiency of their closures shall be in compliance with 7.2.1.3 to 7.2.1.5 of the said Part;

.2 have an additional exit to the deck above.

With the aforesaid conditions satisfied, account is taken of full height of the deckhouses. If they meet the requirements of 7.5.1.2, Part III "Equipment, Arrangements and Outfit", but there is no additional exit to the deck above, such deckhouses shall not be taken into account in calculations of the arms of form stability, however, any deck openings inside such deckhouses are assumed as closed, irrespective of whether they are fitted with closures or not.

The deckhouses whose closures do not comply with the requirements set forth in 7.5.1.2, Part III "Equipment, Arrangements and Outfit" shall not be considered in calculations of the arms of form stability. Any deck openings inside them are regarded as closed only if their coamings and means of closing comply with the requirements of 7.3, 7.7 to 7.10, Part III "Equipment, Arrangements and Outfit".

1.4.2.4 In ships with hatch covers meeting the requirements of 7.10 and 7.13, Part III "Equipment, Arrangements and Outfit", the volumes of hatches located on the freeboard deck may be taken into account.

1.4.2.5 The interpolation curves of the arms of form stability shall have a small-scaled scheme of superstructures and deckhouses taken into account, specifying the openings considered to be open and portions of the upper deck where the deck planking is taken into consideration.

The point shall be indicated in relation to which the arms of form stability are calculated.

1.4.3 Arrangement of compartments.

A drawing of watertight compartments of the ship design documentation shall contain data necessary to calculate the positions of the centres of gravity for individual tanks filled with liquid cargoes and values of corrections for the effect of free surfaces of liquid cargoes on stability.

1.4.4 Deck plan.

1.4.4.1 Deck plans of the ship design documentation shall include all data necessary to determine the centres of gravity of deck cargoes.

1.4.4.2 The deck plans for passenger ships shall indicate the deck area on which passengers can walk freely and maximum permissible crowding of passengers on free areas of the deck, with passengers moving to one side of the ship (see 3.1.2 and 3.1.3).

1.4.5 Arrangement of doors, companionways and side scuttles. Angle of flooding.

1.4.5.1 The arrangement plan of doors and companionways shall include all doors and companionways to an exposed deck, as well as ports and hatches in the shell plating with appropriate references to their design.

1.4.5.2 The arrangement plan of side scuttles shall incorporate all side scuttles located below the uppermost continuous deck, as well as the side scuttles in the superstructures and deckhouses taken into account when calculating the arms of form stability.
1.4.5.3 A curve of angles of flooding for the lowest opening in the ship’s side, deck or superstructure, assumed to be open, shall be appended to the calculations of arms of form stability for each ship.

1.4.6 Calculation of windage area of a ship (except for a floating crane).

1.4.6.1 The windage area shall include the projections of all continuous surfaces of the ship’s hull, superstructures and deckhouses on the centre line plane, as well as projections of masts, ventilators, boats, deck machinery, all tents that might be stretched in stormy weather as also the projections of side surfaces of deck cargoes, including timber cargo, if the ship design makes the carriage of it possible.

For ships having auxiliary sails, the projected lateral areas of rolled up sails shall be taken into account separately according to the ship’s profile plan and included in the total projected lateral area of the continuous surfaces.

It is recommended that projected lateral areas of discontinued surfaces of rails, spars (except for masts) and rigging of ships having no sails and those of various small objects be taken into account by increasing the total projected lateral area of continuous surfaces calculated for draught \( d_{\text{min}} \) by 5 per cent and the statical moment of this area by 10 per cent with respect to the base plane.

The projected lateral areas of discontinued surfaces of ships subjected to icing is taken into account by increasing the projected lateral area and its statical moment of continuous surfaces calculated for draught \( d_{\text{min}} \) under icing conditions by 10 and 20 per cent or 7.5 and 15 per cent, respectively, depending upon the rates of icing stated in 2.4. In this case, the value of the projected lateral area of discontinued surfaces and the position of its centre of gravity with respect to the base plane are assumed to be constant for all loading conditions.

For container ships the projected lateral area shall be taken into account as a continuous surface having no regard to the clearances between containers.

1.4.6.2 The application of the said approximate methods for taking into account the projected lateral areas of discontinued surfaces and small objects is not obligatory. These components of windage area can be determined in a more precise way, if deemed necessary by the designer.

For this purpose when calculating the projected lateral area of discontinued surfaces, such as spars and rigging of ships having no sails, rails, crane trusses of lattice type, etc., the overall areas taken into consideration, shall be multiplied by filling factors whose values are taken as follows:

<table>
<thead>
<tr>
<th>No icing</th>
<th>Icing</th>
</tr>
</thead>
<tbody>
<tr>
<td>For rails covered with meshed wire</td>
<td>0.6</td>
</tr>
<tr>
<td>For rails without meshed wire</td>
<td>0.2</td>
</tr>
<tr>
<td>For crane trusses of lattice type</td>
<td>0.5</td>
</tr>
</tbody>
</table>

For spars, tackle and shrouds of ships with no sails, values of the filling factors shall be adopted in compliance with Table 1.4.6.2 depending upon the ratio \( z_0/b_0 \) where \( z_0 \) is the height of the point of shrouds fastening to the mast over the bulwark; \( b_0 \) is the distance between the shrouds at bulwark.

The projections of the hull above the waterline, deckhouses and superstructures shall be taken into account with a flow coefficient 1.0. The projections of circular section structures located separately on the deck (funnels, ventilators, masts) shall be assumed to have a flow coefficient of 0.6.

When calculating in detail, the projected lateral areas of small objects, discontinued surfaces, spars, rigging, rails, shrouds, tackle, etc., shall be taken to have a flow coefficient of 1.0. If the projections of individual components of the windage area overlap one another fully or in part, the areas of only one of the overlapping projections shall be included in the computation.

If the overlapping projections have different flow coefficients, those with higher coefficients shall be taken for the computation.

1.4.6.3 The arm of windage area \( z \) for determining the heeling moment due to wind pressure in accordance with 2.1.2.1 shall be defined as a distance, in metres, between the centre of the windage area and the actual waterline plane for an upright ship in smooth water. The position of the centre of windage area is determined by a method generally applied for determining the coordinates of the centre of gravity for a plane figure.

1.4.6.4 The windage area and its statical moment shall be calculated for the ship’s draught \( d_{\text{min}} \). These

*Table 1.4.6.2*
components for other draughts are determined by calculation. The use of linear interpolation is permissible if the second point is assumed at the draught corresponding to the summer load line.

1.4.7 Computation of the liquid cargo effect.

1.4.7.1 Tanks for each kind of liquid, including those for water ballast, which depending on the service conditions may simultaneously have free surfaces as well as tanks of stabilizer systems irrespective of their type are to be taken into account when determining the free surfaces effect of liquids on ship’s stability at large angles of heeling. To allow for the free surface effect, one design combination of single tanks or their combinations for each kind of liquid cargo shall be drawn up. Considering the number of tank combinations for the individual kinds of liquid cargo or single tanks, likely to occur under service conditions, only those developing the greatest total heeling moment $\Delta M_{30}$ due to liquid overflow at the ship’s heel of $30^\circ$ and for a floating crane $\Delta M_{15}$ at the crane’s heel of $15^\circ$ shall be selected. In all cases, except for those expressly provided in 3.2.2 and 3.4.2 the correction for free surfaces shall be calculated for a tank filled by 50 per cent of its capacity.

The methods for estimating corrections are presented in the Register’s Instructions on Estimating Liquid Cargo Free Surface Effect on Ship’s Stability. It is permissible to choose the tanks to be taken into account in compliance with the Instructions on Loading and Consuming of Liquid Cargoes.

1.4.7.2 The tanks complying with the following condition are not included in the computation:

$$l_{30}b_{1/2} \gamma \sqrt{C_b} < 0.01 \Delta_{\text{min}}$$  \hspace{1cm} (1.4.7.2-1)

where $l_{30}$ = non-dimensional factor determined from Table 1.4.7.2.

<table>
<thead>
<tr>

</tbody>
</table>

For floating cranes the tanks meeting the following condition are not included in the computation:

$$\Delta M_{15} = 0.0216 \gamma \sqrt{C_b} \frac{b_{1/2}}{d_i} < 0.02 \Delta_{\text{min}}.$$  \hspace{1cm} (1.4.7.2-2)

Total correction $\Delta M_{15}$ for tanks not included in the calculation shall not exceed $0.05 \Delta_{\text{min}}$. Otherwise, appropriate corrections shall be taken into account in the computation.

1.4.7.3 Selection of tanks included in the design combination to allow for the free surface effect on initial stability shall be carried out in compliance with the directions of 1.4.7.1, with the difference that, proceeding from initial stability, the tanks shall be selected from the maximum value of $\Delta m_b$ equal to the product of the own moment of inertia of free surface for a ship in the upright position by the density of the liquid cargo.

1.4.7.4 The tanks complying with the following condition are not included in the computation:

$$\Delta m_b = 0.0834 \gamma \sqrt{C_b} \frac{b_{1/2}}{d_i} < 0.01 \Delta_{\text{min}}.$$  \hspace{1cm} (1.4.7.4)

Usual residues of liquids in emptied tanks are not taken into account in the computation.

For floating cranes the tanks with $\Delta m_b$ being less than $0.1 \Delta_{\text{min}}$ are not included in the computation. In this case, the total correction $\Delta m_b$ for tanks not allowed for in the computation shall not exceed $0.25 \Delta_{\text{min}}$. Otherwise, appropriate corrections shall be taken into account in the computation.

1.4.7.5 In those cases when the coamings are mounted on the open space on the deck of the tankers for prevention of cargo spillage forming an enclosed space (well), such space is to be treated as if filled with the outboard water and it is to be considered in calculation of correction to the initial metacentric height in accordance with 1.4.7.4.

1.4.8 Loading conditions.

1.4.8.1 Stability shall be checked in all loading conditions specified in Sections 3 and 4 for various types of ships.

1.4.8.2 For the types of ships which are not covered by special provisions of Section 3, the loading conditions to be examined shall be as follows:

- .1 ship in fully loaded condition with full stores;
- .2 ship in fully loaded condition with 10 per cent of stores;
- .3 ship without cargo, with full stores;
- .4 ship without cargo, with 10 per cent of stores.

1.4.8.3 If the loading conditions anticipated in normal service of a ship as regards stability are less favourable than those listed in 1.4.8.2 or specified in Section 3, stability shall also be checked for these conditions.

1.4.8.4 If there is solid ballast on board, its mass shall be included in the light-ship condition.

1.4.8.5 In all cases of loading which might occur in the ship’s service, except those expressly provided in Section 3, the weight of ballast water may be included in the deadweight of the ship, where necessary.

1.4.9 Curves of stability.

1.4.9.1 Stability curves calculated with due allowance for the corrections of free surfaces shall be plotted for all loading conditions under consideration.

\(^{1}\)Collection of Regulating Documents, book 1, 1979 (in Russian).
1.4.9.2 If there are openings considered to be open in the ship’s sides, upper deck or superstructures through which water can penetrate inside the hull, the stability curves are considered effective up to the angle of flooding. At the inclinations of the ship exceeding the angle of flooding, the ship may be regarded to have entirely lost her stability and the curves of stability at this angle are cutting short.

1.4.9.3 If the spread of water coming to a superstructure through openings considered to be open is limited only by this superstructure or a part thereof, such superstructure or its part shall be considered as non-existent at the angles of heel exceeding the angle of flooding. In this case, the statical stability curve becomes stepped and that of dynamical stability broken.

1.4.10 Design data relating to stability checking and summary tables.

1.4.10.1 For ships under investigation, all design data relating to stability checking (calculations of loading, initial stability, curves of stability, windage area, amplitudes of roll, heeling due to crowding of passengers on one side, heeling when turning as also that due to icing, etc.) shall be submitted to the Register for consideration.

1.4.10.2 For all design loading conditions, summary tables presenting the results of calculations of displacement, position of the centre of gravity, initial stability and trim, as well as summary tables of results of stability checking for the compliance with the requirements of the present Part of the Rules shall be drawn up.

1.4.11 Requirements for Information on Stability.

1.4.11.1 To provide adequate stability of ships in service, the Information on Stability approved by the Register and containing the following data shall be issued for each ship:

.1 particulars of ship;
.2 information on how the ship conforms to stability criteria and directions based on the Register requirements for stability, to prevent the ship capsizing;
.3 designer’s recommendations concerning stability and other instructions for safe service;
.4 stability data for typical, predetermined loading conditions;
.5 advice and documents necessary to estimate trim and stability of the ship for any cases of full and partial loading which might occur in the ship’s service.

The trim and stability of the ship shall be determined by calculation.

1.4.11.2 Where on-board computers and automatic measuring systems are used to control trim and stability, they are to be approved by the Register together with software and stability control procedure to be applied in service.

Availability of Register approved computer or automatic measuring system on board to control the ship stability and trim shall not be considered a ground for deleting any section of the Information.

The procedure of using these computers is to be specified in their manuals where it is to be mentioned that the accuracy of these computers and systems prior to their use is to be checked by ship crew.

1.4.11.3 The Information shall be compiled with regard to the ship’s inclining test data, except for the cases stated in 1.5.7.

For the group of the ships specified in 1.5.2.1, the Information shall be prepared on the basis of the inclining test data of the first ship of the group. The Information compiled for the first ship of any group may be extended to ships of another group, provided that based on the inclining test results for the first ship of this group the light-ship displacement changes by not more than 2 per cent, the height of the centre of gravity increases by not more than the value obtained as per 1.5.2.2 and the requirements of this Part of the Rules are not violated.

In this case, to be indicated in the Information prepared in compliance with 1.4.11.1.3 for the guidance of the master, are the displacement and centre of gravity coordinates for the light condition of the ship as obtained on the basis of the inclining test results for the first ship of the group concerned.

For ships for which inclining test may be omitted in compliance with 1.5 design light-ship displacement shall be specified, and the centre of gravity height of light ship is calculated according to 1.5.2.2.3 or 1.5.7. It shall be simultaneously stated in the Information that the ship has not been inclined and the centre of gravity height of the light ship has been calculated in accordance with 1.5.2.2.3 or 1.5.7.

1.4.11.4 When carrying non-grain bulk cargoes the document shall be supplemented by the materials making it possible to assess the ship stability during loading and unloading operations.

1.4.11.5 When ships in service call ports which require exchange of the water ballast at sea in advance, they are to have the Ballast Water Management Plan which shall contain the following:

.1 information on the authorized method of ballast exchange (exchange by full dewatering of tanks with further ballasting and/or continuous tank pumping);
.2 the detailed instructions as regards operation of pumps, ballast system, preparation of tanks and air pipes to ballasting operations, instructions in respect of the ballast exchange procedure and instructions as regards of the hull impermeability after completion of ballast exchange operations;
.3 instructions for prevention of over and under pressurization of ballast tanks;
4 information on free surface effects on stability and sloshing loads in tanks that may be slack at any one time;
5 information on weather conditions admissible for ballast exchange;
6 weather routing in areas affected by cyclones, typhoons and hurricanes, or heavy icing conditions;
7 instructions for maintenance of adequate intact stability in accordance with an approved Instruction on Stability;
8 information on permissible seagoing strength limits of shear forces and bending moments for ships at sea;
9 information on torsional forces, where relevant;
10 accepted values of minimum/maximum forward and aft draughts;
11 information on wave induced hull vibration;
12 instructions for documented record of ballasting operations;
13 instructions for contingency procedures for situations which may affect the water ballast exchange at sea (including worsening of weather conditions, pump failure, de-energization of ship, etc);
14 information on time necessary to complete the water ballast exchange or an appropriate sequence thereof, taking into account that the amount of ballast water may represent 50% of the total cargo capacity for some ships;
15 instructions for monitoring the amount of ballast water;
16 assessment of application of "priming" considering construction of air pipes;
17 number of full tank changes during "priming" (at least 3 changes);
18 list of manholes which may be left opened during exchange of ballast with a notification that they are to be closed after completion of exchange;
19 instructions for ballast exchange under low temperatures (usually it shall not be carried out);
20 if necessary, a requirement of availability on ship of the load control instrument for comparison of actual shear forces and bending moments with accepted values;
21 list of conditions and circumstances which do not allow the ballast water exchange.

1.5 INCLINING TEST

1.5.1 To be inclined are:
.1 series-built ships as per 1.5.2;
.2 every newly built ship of non-series construction;
.3 every ship after reconstruction;
.4 ships after major repair, alteration or modification as per 1.5.3;
.5 ships after installation of permanent solid ballast as per 1.5.4;
.6 ships whose stability is unknown or gives rise to doubts;
.7 passenger ships in service at intervals not exceeding five years if stipulated by 1.5.5.
.8 fishing vessels in service (of 30 metres length and less) at intervals not exceeding fifteen years and fishing vessels over 30 metres length if stipulated by 1.5.5.

1.5.2 Out of the series of ships under construction at each shipyard the following ships are to be inclined:
.1 the first ship, then every fifth ship of the series (i.e. sixth, eleventh, etc.).

Depending on the seasonal conditions during the delivery of the ship and subject to special agreement with the Register, the inclining test of the next ship of the series may be permitted instead of the ship to be delivered. Beginning from the twelfth ship of the series, the Register may require the inclining of the smaller number of ships if it is demonstrated to the satisfaction of the Register that in the process of constructing the ships of the series stability of their mass and centre of gravity position is ensured within the limits stated in 1.5.2.2;

2.2 a series-built ship if structural alterations therein compared with the first ship of the series, as shown by the calculation, result in:
2.1 the changes in the light-ship displacement by more than 2 per cent; or
2.2 the increase of the light-ship centre of gravity height exceeding simultaneously 4 cm and the lesser value determined by the formulae:

$$\delta z_g = 0.1 \frac{\Delta_1}{\Delta_0} l_{max},$$

$$\delta z_g = 0.05 \frac{\Delta_1}{\Delta_0} h$$

(1.5.2.2.2-1)

(1.5.2.2.2-2)

where

- $\Delta_0 =$ light-ship displacement, in t;
- $\Delta_1 =$ ship’s displacement under the most unfavourable loading condition as regards the value of $h$ or $l_{max}$, in t;
- $l_{max} =$ maximum arm of statical stability curve under the most unfavourable design loading condition as regards its value;
- $h =$ corrected metacentric height under the most unfavourable design loading condition as regards its value;

or

2.3 violation of the requirements of this Part of the Rules for design loading conditions with $z_g = 1.2 z_{g2} - 0.2 z_{g1}$ where $z_{g1}$ ($z_{g2}$) is design light-ship centre of gravity height prior to (after) structural changes; $z_g$ is an assumed light-ship centre of gravity height.

Such ship shall be considered the first ship of a new series as regards stability, and the inclining test
procedure of the subsequent ships shall comply with the requirements of 1.5.2.1.

1.5.3 After major repair, alteration and modification to be inclined are ships, in which structural changes, as shown by calculation, result in:

.1 change of load (total mass of loads removed or added) by more than 6 per cent of the light-ship displacement, or

.2 change in the light-ship displacement by more than 2 per cent, or

.3 increase in the light-ship centre of gravity height by more than the value obtained as per 1.5.2.2, or

.4 violation of the requirements of this Part of the Rules for design loading conditions as specified in 1.5.2.2.3.

Irrespective of the calculations submitted, the Register may require in compliance with 1.5.1.6 the inclining test of the ship to be performed, proceeding from the technical condition of the ship.

1.5.4 After installation of the permanent solid ballast each ship is to be inclined.

The inclining test of the ship may be dispensed with if the Register is satisfied that when installing the ballast, efficient control is ensured to effect the design values of mass and centre of gravity position, or these values can be properly confirmed by calculation.

1.5.5 Experimental determination of the light-ship weight shall be effected periodically for finding whether according to the 1.5.1.7-1.5.1.8 the inclining test is required to:

.1 passenger ships;

.2 fishing vessels over 30 metres length after ten years in service.

Experimental determination of the light-ship weight is to be carried out at intervals not more than five years.

If a change in the light-ship displacement by more than 2% or in longitudinal gravity-centre position by more than 1% of the ship’s length as compared to the approved Information on Stability is found out as a result of the experimental determination of the light-ship weight then the ship is to be inclined.

1.5.6 Where the inclining test results for the ship built show that the light-ship centre of gravity height exceeds design value to the extent that involves the violation of the requirements of the present Part of the Rules, calculations with explanation of the reasons of such differences are to be attached to the Inclining Test Records.

Based on the investigation analysis of the documents submitted, or in case such documents are not available, the Register may require the repeated (check) inclining test of the ship to be performed. In this case, both Inclining Test Records are to be submitted to the Register for consideration.

1.5.7 At the discretion of the owner, a newly built ship may be exempted by the Register from the inclining test provided an increase of a light-ship centre of gravity height by 20 per cent as against the design value will not result in the violation of the requirements of this Part of the Rules.

1.5.8 Ship’s loading during the inclining test shall be as far as practicable close to the light-ship displacement. The mass of missing loads shall not be more than 2 per cent of the light-ship displacement, and the mass of surplus loads less inclining ballast and ballast according to 1.5.9, 4 per cent.

1.5.9 The metacentric height of the ship in the process of the inclining test shall be at least 0.20 m. For this purpose necessary ballast may be taken. When water ballast is taken, the tanks shall be carefully sealed.

1.5.10 To determine angles of inclination during the inclining test not less than three plumb lines at least 3 m long or at least two devices approved by the Register shall be provided, or a special facility approved by the Register for use in the inclining test shall be employed.

For ships under 30 m in length only two plumb lines at least 2 m long may be used.

1.5.11 In well performed inclining test the value of the metacentric height obtained may be used in calculations with no deduction for probable error of the test.

The inclining test is considered to be satisfactory performed, provided:

.1 for each measurement the following condition is fulfilled:

$$|h_l - h_k| \leq \frac{2 \sqrt{\sum (h_l - h_k)^2}}{n - 1}$$

where

- \(h_l\) = metacentric height obtained by individual measurement;
- \(h_k = \frac{\sum h_k}{n}\) is metacentric height obtained in inclining the ship;
- \(n\) = number of measurements.

Measurements not meeting the above condition are excluded when treating the results with appropriate change of the total number \(n\) and repeated calculation of the metacentric height \(h_k\);

.2 probable error of the test

$$t_{sw} \sqrt{\frac{\sum (h_l - h_k)^2}{m(n - 1)}}$$

fulfils the condition

$$t_{sw} \sqrt{\frac{\sum (h_l - h_k)^2}{m(n - 1)}} \leq 0.02(1 + h_k) \text{ if } h_k \leq 2 \text{ m}$$

and
\[ t_{sn} \sqrt{\frac{\sum (h_i - h_k)^2}{n(n-1)}} \leq 0.04 h_k \text{ if } h_k > 2 \text{ m.} \]

Factor \( t_{sn} \) is taken from Table 1.5.11;

<table>
<thead>
<tr>
<th>( n )</th>
<th>( t_{sn} )</th>
<th>( n )</th>
<th>( t_{sn} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>5.4</td>
<td>13</td>
<td>4.3</td>
</tr>
<tr>

<td>4.6</td>
<td>16</td>
<td>4.0</td>
</tr>
<tr>
<td>12</td>
<td>4.5</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following condition is fulfilled:

\[ t_{sn} \sqrt{\frac{\sum (h_i - h_k)^2}{n(n-1)}} \frac{\Delta_0}{\Delta_1} \leq 0.05 h \text{ or } 0.10 l_{\text{max}}, \]

whichever is less, but not less than 4 cm, where \( h \) and \( l_{\text{max}} \) are calculated for the most unfavourable design loading conditions as regards their values;

A total number of satisfactory measurements is not less than 8.

No more than one measurement is excluded from the calculation (greater number of measurements may be excluded only in well-grounded cases on agreement with the Register).

1.5.12 Where the requirements of 1.5.11 are not fulfilled, the value of the metacentric height less the probable error of the test obtained as per 1.5.11.2 may be taken for calculations upon agreement with the Register.

1.5.13 The inclining test of the ship shall be performed in compliance with the Register’s Instructions on Inclining Test.

Other methods of inclining the ships may be permitted provided it will be demonstrated that the accuracy of the inclining test results meets the requirements of this Chapter.

1.6 DEPARTURES FROM THE RULES

1.6.1 If doubts arise with regard to stability of any ship when the requirements of this Part of the Rules are complied with or the requirements set forth in this Part of the Rules are considered to be too severe, the Register may permit, on own initiative or a well-grounded statement of design and service bodies, appropriate departures from the requirements of this Part of the Rules for the ship concerned.

1.6.2 When a ship navigating in a particular area does not comply with the requirements of this Part of the Rules, the Register may, in each particular case, either restrict the ship’s area of navigation or place other limitations depending upon the ship’s stability characteristics, service conditions and purpose the ship is intended for.

1.7 CONDITIONS OF SUFFICIENT STABILITY

1.7.1 Under the most unfavourable loading conditions with regard to stability, the ship’s stability, except for floating cranes, pontoons, floating docks and berth-connected ships shall comply with the following requirements:

1. the ship shall withstand, without capsizing, simultaneously the effect of dynamically applied wind pressure and rolling the parameters of which are determined in compliance with the directions given in Section 2;

2. numerical values of the parameters of the statical stability curve for the ship on still water and the values of the corrected initial metacentric height shall not be below those specified in Section 2;

3. the effect of consequences of probable icing upon stability shall be taken into account in compliance with Section 2;

4. stability of a ship shall comply with additional requirements of Section 3.

1.7.2 The stability of floating cranes, pontoons, floating docks and berth-connected ships shall comply with the requirements of Section 4.

1.7.3 For ships to which the requirements of Part V "Subdivision" are applicable, the intact stability shall be sufficient to meet these requirements in damaged condition.

1.7.4 To ships of unrestricted service (passenger ships, cargo ships, container ships, timber carriers, fishing vessels and special purpose ships) alternative requirements contained in Section 5 may be applied instead of requirements of 2.1, 2.2, 2.3 and 2.4.7.

1.7.5 Stability of ships which have distinguishing marks of provision with means for fighting fires on board other ships in their class notation is to meet the requirements of this Part in the course of fire fighting operations on the assumption that all monitors operate simultaneously with the maximum supply rate in the direction corresponding to the minimum stability of the ship.

1.8 PASSAGE OF SHIPS FROM ONE PORT TO ANOTHER

1.8.1 When passing from one port to another, the ship’s stability shall meet the requirements imposed upon ships navigating in a region through which the passage is expected to be undertaken.

1.8.2 For ships whose stability cannot be raised up to that required by 1.8.1, the Register may permit the passage of the ship provided the ship’s stability complies with weather restrictions.
2 GENERAL REQUIREMENTS FOR STABILITY

2.1 WEATHER CRITERION

2.1.1 The requirements for stability set forth in this Part of the Rules are differentiated depending upon the ship's area of navigation.

Definitions of restricted areas of navigation are given in 2.2.5 of Part I "Classification".

Specific restrictions of navigation areas for each sea region for ships of restricted area of navigation III C1I are established with due regard for wind and wave conditions of the region concerned by the Inspectorate of the Register in accordance with 2.2.5.3 of Part I "Classification".

2.1.1.1 Stability of ships of unrestricted service and of restricted areas of navigation I and II shall be considered sufficient as to weather criterion \( K \), if the dynamically applied heeling moment \( M_v \) due to wind pressure in the most unfavourable loading condition as to stability equals or is below the capsizing moment \( M_c \), that is:

\[
K = \frac{M_v}{M_c} \geq 1.0.
\]

(2.1.1.1)

For ships specially intended for operation in heavy seas (for example, weather observation ships) the value of weather criterion \( K \) is subject to special consideration by the Register in each particular case; it is recommended that this value should not be less than 1.5.

2.1.1.2 At the discretion of the Register, the ships whose stability with respect to the weather criterion does not comply with the requirements for the ships of restricted area of navigation II, may be allowed to operate as ships of restricted area of navigation III with additional restrictions, taking into account the peculiarities of the area and the nature of service.

2.1.2 Calculation of the heeling moment due to wind pressure.

2.1.2.1 The heeling moment \( M_v \), in kNm, is assumed to be equal to the product of wind pressure \( p_w \) by windage area \( A_v \) and by the distance \( z \) between the centre of windage area and the actual waterline plane:

\[
M_v = 0.001 p_w A_v z.
\]

(2.1.2.1)

The value of the heeling moment is assumed to be constant during the whole period of the ship's inclination.

2.1.2.2 The values of wind pressure \( p_w \), in Pa, shall be taken from Table 2.1.2.2 depending upon the ship's area of navigation and arm of windage area.

2.1.3 Calculation of the amplitude of roll.

2.1.3.1 The amplitude of roll, in deg., of a round-bilged ship having no bilge and bar keels is calculated using the formula

\[
\theta_v = X_1 X_2 Y
\]

(2.1.3.1)

where \( X_1, X_2 \) = non-dimensional factors;

\( Y \) = factor, in deg.

The values of factor \( Y \) shall be taken from Table 2.1.3.1-1 depending on the ship's area of navigation and the ratio \( \sqrt{B/\alpha} \).

The values of factor \( X_1 \) shall be taken from Table 2.1.3.1-2 depending upon the ratio \( B/d \).

### Table 2.1.2.2

</tbody>
</table>

2.1.3.2 If a ship is provided with bilge keels, or a bar keel or both, the amplitude of roll, in deg., shall be calculated using the formula

$$\theta_{2r} = k \theta_{1r}$$

(2.1.3.2)

where values of factor $k$ shall be taken from Table 2.1.3.2 depending upon the ratio $A_k/LB$ where $A_k$ is a total overall area of bilge keels, or an area of the lateral projection of the bar keel, or a sum of these areas, in m$^2$.

2.1.3.3 The amplitude of roll for a ship having sharp bilges shall be assumed to be equal to $70$ per cent of that calculated from Formula (2.1.3.1).

2.1.3.4 The amplitude of roll for ships provided with anti-rolling devices shall be determined taking no account of operation of these devices.

2.1.3.5 The values of amplitudes of roll shall be rounded off to whole degrees.

2.1.4 Determination of the capsizing moment.

The capsizing moment may be determined by any method approved by the Register.

The recommended procedure of the capsizing moment determination is given in Appendix 2.

2.2 CURVE OF STATICAL STABILITY

2.2.1 The maximum arm of the curve of statical stability $l_{\text{max}}$ shall not be less than $0.25$ m for ships with $L \leq 80$ m and not less than $0.20$ m for ships with $L \geq 105$ m at the heeling angle $\theta_{1r} \geq 30^\circ$. For intermediate values of $L$, the value $l_{\text{max}}$ shall be determined by linear interpolation. The limit of positive statical stability (the angle of vanishing stability) shall be at least $60^\circ$. However, for ships of restricted area of navigation III C1 it may be lowered to $50^\circ$ provided that every lowering by $1^\circ$ is accompanied by an increase of the maximum arm of the curve of statical stability by $0.01$ m above the specified value. If the curve of statical stability has two maxima due to the influence of superstructures or deckhouses, the first maximum from the upright position shall occur at the angle of heel not less than $25^\circ$.

2.2.2 Ships with ratio $B/D > 2$ are allowed to navigate having the angle of vanishing stability and the angle corresponding to the maximum arm of the curve less than those required by 2.2.1 by the following values:

1. angle of vanishing stability, by a value $\Delta \theta_{1r}$ determined from the formula

$$\Delta \theta_{1r} = 40^\circ \left( \frac{B}{D} - 2 \right)(K - 1).$$

(2.2.2.1)

Where $B/D > 2.5$ and $K > 1.5$, the ratio $B/D = 2.5$ and $K = 1.5$ should be adopted. The value of $\Delta \theta_{1r}$ is to be rounded off to the nearest integer;

2. angle corresponding to the maximum arm of the curve, by a value equal to half the decrease in the angle of vanishing stability.

2.2.3 A ship shall comply with the aforesaid requirements when the correction for free surfaces is taken into account in curves of statical stability in accordance with the provisions of 1.4.7.

2.2.4 For ships failing to comply with the requirements of this Chapter with respect to the angle of vanishing stability because of the curve cut short at the angle of flooding, navigation may be permitted as for ships of restricted service depending upon the value of wind pressure endured when checking stability for compliance with the weather criterion. It is necessary, however, that the conventional angle of vanishing stability determined on the assumption of weathertight closures of the openings through which flooding occurs shall be not less than that required by this Chapter.

2.3 METACENTRIC HEIGHT

2.3.1 The corrected initial metacentric height for all ships in all loading conditions, except for the lightship condition, shall be positive.

For all ships, except for fishing vessels, whale factory ships, fish factory ships and other ships used for processing the living resources of the sea and not
engaged in catching the same, negative initial metacentric height for a light ship is subject to special consideration by the Register in each case.

For all ships, the initial metacentric height in the light-ship condition may be determined taking trim into consideration.

2.3.2 Initial stability of well-deck ships shall be checked for the case of water penetration into the well. Amount of water in the well and its free surface shall correspond to the water level up to the lower edge of the freeing ports for a ship in upright position allowing for the deck camber.

Should a ship have two or more wells, stability shall be checked for the case of flooding of the largest one.

2.4 ALLOWANCE FOR ICING

2.4.1 For ships intended for winter navigation within winter seasonal zones set up by Load Line Rules for Sea-Going Ships, stability with due regard for icing, as specified in this Chapter, shall be checked in addition to the main loading conditions. In the calculation, account should be taken of increase in displacement, height of the centre of gravity and windage area due to icing. The stability calculation under icing shall be carried out for the worst loading condition as to stability. When checking stability under icing, the mass of the ice is considered as an overload and is not included in the ship’s deadweight.

2.4.2 When determining the heeling and capsizing moments for ships navigating in winter seasonal zones to the north of latitude 66°30’ N and to the south of latitude 66°00’ S, as also in winter in the Bering Sea, the Sea of Okhotsk and in the Tatarski Strait, the assumed rates of icing shall be as specified in 2.4.3 and 2.4.4.

2.4.3 The mass of ice per square metre of the total area of horizontal projection of exposed weather decks shall be assumed to be 30 kg. The total horizontal projection of decks shall include horizontal projections of all exposed decks and gangways, irrespective of the availability of awnings. The vertical moment due to this loading is determined for heights of the centre of gravity of the corresponding areas of decks and gangways.

The deck machinery, arrangements, hatch covers, etc. are included in the projection of decks and not taken into account separately.

2.4.4 The mass of ice per square metre of the windage area shall be assumed to be 15 kg. In this case, the windage area and the height of the centre of gravity shall be determined for a draught $d_{\text{min}}$, as specified in 1.4.6, but without the allowance for icing.

2.4.5 In other areas of the winter seasonal zone, the rates of icing for winter time shall be assumed to be equal to half those specified in 2.4.3 and 2.4.4, except for the areas where, on agreement with the Register, icing need not be taken into account.

2.4.6 The mass of ice and vertical moment computed in compliance with 2.4.3 to 2.4.5 cover all loading conditions when drawing up the Information.

2.4.7 For the statical stability curves plotted with the allowance for icing, the angle of vanishing stability shall be not less than 55° and the maximum arm of statical stability for ships of restricted service shall be at least 0.2 m at an angle of heeling not less than 25°.

For ships with ratio $B/D > 2$, an additional reduction of the angle of vanishing stability $\theta_n$ is permissible by the values equal to half those determined from Formula (2.2.2.1).

2.4.8 For ships navigating in winter in the regions of the Black and Asow Seas northwards of the parallel of latitude 44°00’ N, as well as in the region of the Caspian Sea northwards of the parallel of latitude 42°00’ N the icing is to be taken into account in compliance with 2.4.5.

3 ADDITIONAL REQUIREMENTS FOR STABILITY

3.1 PASSENGER SHIPS

3.1.1 Stability of passenger ships shall be checked for the following loading conditions:

.1 ship in the fully loaded condition, with full stores and full number of class and unberthed passengers and their effects. A possibility of liquid ballasting shall be agreed with the Register;

.2 ship in the fully loaded condition, with the full number of class and unberthed passengers and their effects, but with 10 per cent of stores;

.3 ship without cargo, but with the full number of class and unberthed passengers and their effects and with full stores;

\[\text{For additional requirements for ships under } 20 \text{ m in length, see 3.9.}\]
4 ship in the same loading condition as in .3, but with 10 per cent of stores;
5 ship without cargo and passengers, but with full stores;
6 ship in the same loading condition as in .5, but with 10 per cent of stores;
7 ship in the same loading condition as in .2, but with 50 per cent of stores.

When checking stability for the compliance with the weather criterion, class passengers shall be assumed to be in their accommodation and unberthed passengers on their decks. The stowage of cargo in holds, 'tween decks and on decks is assumed for normal service conditions of the ship. Stability with an allowance for icing shall be checked with no passengers on exposed decks.

3.1.2 Initial stability of passenger ships shall be such that in the eventual case of crowding of passengers to one side on the upper deck accessible for passengers, as near to the bulwark as possible, the angle of statical heel is not more than the angle at which the freeboard deck immerses or the angle at which the bilge comes out of water, or one half of the angle of flooding, whichever is less; in any case, the angle of heel shall not exceed 10°.

3.1.3 The angle of heel due to the combined effect of heeling moments \( M_{h1} \) (as a result of crowding of passengers to one side on the promenade decks) and \( M_{h2} \) (on steady turning) shall not exceed the angle at which the freeboard deck immerses, or the angle at which the bilge comes out of water, or three-fourths of the angle of flooding, whichever is less, but in any case the angle of heel shall not exceed 12°.

3.1.4 The heeling moment, in kN.m, due to turning shall be determined using the formula

\[
M_{h2} = \frac{0.24A\rho g^2}{L} (z_a - \frac{d}{2}).
\]  

(3.1.4)

3.1.5 When calculating ship’s stability on turning and for heeling caused by crowding of passengers to one side, no account shall be taken of wind and rolling effects.

3.1.6 When determining admissible distribution of passengers crowding to one side on their promenade decks, it is to be assumed that the ship’s normal operating conditions are duly observed with an allowance for the position of the equipment and arrangements and the regulations concerning the access of passengers to a particular deck area.

3.1.7 When determining the area where crowding of passengers may be permitted, the passages between benches shall be included in the computation with factor 0.5. The area of narrow external passages between the deckhouse and the bulwark or railing up to 0.7 m wide shall be included with factor 0.5.

3.1.8 For the purpose of determination of the angle of heel caused by crowding of passengers to one side, the mass of each passenger shall be assumed to be 75 kg. The assumed density of distribution of passengers is 6 persons per square metre of the free area of the deck. The height of the centre of gravity for standing passengers shall be assumed equal to 1,1 m above the deck level and that for sitting passengers 0,3 m above the seats.

3.1.9 All computations of the statical angle of heel caused by passengers crowding to one side and by turning shall be carried out taking no account of icing, but with a correction for free surfaces of liquid cargoes as specified in 1.4.7.

3.2 DRY CARGO SHIPS

3.2.1 Stability of cargo ships shall be checked for the following loading conditions:

1 ship having a draught to the summer load line with homogeneous cargo filling cargo holds, 'tween decks, coaming spaces and trunks of cargo hatches, with full stores, but without liquid ballast.

Where, owing to the peculiarities of the ship’s service, the full-load draught is less than that to the prescribed load line, the stability calculations shall be carried out for this smaller draught;

2 ship in the same condition as in .1, but with 10 per cent of stores and, where necessary, with liquid ballast;

3 ship without cargo, but with full stores;

4 ship in the same condition as in .3, but with 10 per cent of stores.

3.2.2 Where cargo holds of a ship in the loading conditions as under .3 and .4 of 3.2.1 are used to additionally take liquid ballast, ship’s stability with liquid ballast in these holds shall be checked. The effect of free surfaces in ship’s store tanks is taken into account in compliance with the provisions of 1.4.7 and that in holds with liquid ballast in accordance with their actual filling.

3.2.3 Where ships are normally engaged in carrying deck cargoes, their stability shall be checked for the following additional conditions:

1 ship having a draught to the summer load line (with regard to 3.2.1.1); with holds and 'tween decks filled by homogeneous cargo, with deck cargo, full stores and liquid ballast, if necessary;

2 ship in the same loading condition as in .1, but with 10 per cent of stores.

3.2.4 The corrected initial metacentric height of ro-ro ships in the loaded condition, with icing disregarded, shall not be less than 0.2 m.

3.2.5 If, during stability verification, it is found out that the value of one of the parameters \( \sqrt{h/B} \) and \( B/d \) at least exceeds 0.08 and 2.5, respectively, the
ship’s stability is to be checked additionally on the basis of the acceleration criterion $K^*$ in accordance with 3.12.3. In so doing, if the calculated acceleration value $a_{cal}$ (in fractions of $g$) is in excess of the maximum permissible one, the possibility of operating the ship under appropriate loading conditions should be specially considered by the Register. Particular loading conditions under which the ship is permitted to proceed to sea with $a_{cal} > 0.30$ shall be specified in the Information on Stability.

In the case of a ship in the ballast condition no check of the acceleration criterion may be effected.

### 3.3 TIMBER CARRIERS

3.3.1 Stability of timber carriers shall be checked for the following loading conditions:

.1 ship carrying timber cargo with a prescribed stowage rate (if stowage rate of timber cargo is not specified, the calculation of stability shall be made assuming $\mu = 2.32$ m$^3$/t) in holds and on deck and having a draught to the timber summer load line (taking account of 3.2.1.1), with full stores;

.2 ship in the same loading condition as in .1, but with 10 per cent of stores;

.3 ship with timber cargo, having the greatest stowage rate specified, in holds and on deck, with full stores;

.4 ship in the same loading condition as in .3, but with 10 per cent of stores;

.5 ship without cargo, but with full stores;

.6 ship in the same loading condition as in .5, but with 10 per cent of stores.

3.3.2 The stowage of timber cargo in timber carriers shall comply with the requirements of the Load Line Rules for Sea-Going Ships as well as with the provisions of the Information on Stability or special instructions.

3.3.3 When calculating the arms of form stability for timber carrier, the volume of timber cargo on deck may be included in the calculation with full breadth and height and permeability of 0.25.

3.3.4 Information on Stability shall include data to enable the master to estimate the ship’s stability when carrying a timber cargo on deck the permeability of which differs substantially from 0.25. Where the approximate permeability is not known, at least three values shall be adopted, namely, 0.25, 0.4 and 0.6.

3.3.5 The corrected initial metacentric height under the first and third loading conditions stated in 3.3.1 shall be not less than 0.1 m, the second and fourth — not less than 0.05 m and the fifth and sixth — not less than 0.15 m.

3.3.6 When the effect of icing is calculated, the upper surface of deck timber cargo shall be considered as if it were the deck, and its side surfaces above the bulwark — as if they were part of the designed windage area. The icing rate for these surfaces should be three times that specified in 2.4.

3.3.7 For timber carriers intended to operate in areas in which the icing is not required to be taken into account as well as for those navigating in summer within winter seasonal zones, the stability calculation shall be made for the most unfavourable loading conditions out of those indicated in 3.3.1.1 to 3.3.1.4 with regard to possible addition in mass of the deck cargo due to absorption of water.

Where no appropriate data on the extent of water absorption by different kinds of wood are available, it is recommended that the addition in mass of the deck cargo be assumed equal to 10 per cent. This addition is considered as an overload and is not included in the ship’s deadweight.

3.3.8 If timber carriers are used for the carriage of other kinds of cargo, their stability shall be checked according to the provisions of 3.2. In such a case, computation of the arms of form stability and the windage area shall be carried out taking no account of deck timber cargo.

3.3.9 The requirements of this Chapter apply to other types of ships when they are used for the carriage of deck timber cargo.

The requirements of 3.3.2 (concerning the need for compliance with the requirements of Load Line Rules for Sea-Going Ships) and of 3.3.3 do not apply to the ships for which the buoyancy of timber deck cargo is not included in the calculation of stability.

3.3.10 Double bottom tanks where fitted within the midship half-length of the ship shall have adequate watertight longitudinal subdivision.

### 3.4 TANKERS

3.4.1 Stability of tankers carrying liquid cargoes shall be checked for the following loading conditions:

.1 ship having draught up to summer load line (with regard to 3.2.1.1), fully loaded and with full stores;

.2 ship fully loaded, but with 10 per cent of stores;

.3 ship without cargo, but with full stores;

.4 ship in the same loading condition as in .3, but with 10 per cent of stores.

3.4.2 For refuelling tankers, stability shall be checked for additional loading condition: a ship with 75 per cent of cargoes and free surfaces in tanks for each kind of cargo, and 50 per cent of stores without liquid ballast. Account of the free surface effect in ship’s stores tanks shall be taken as specified in 1.4.7 and in cargo tanks according to the extent of their actual filling.

3.4.3 The requirements of 3.4.2 apply to oil recovery ships as well.
3.4.4 Stability of tankers having cargo tank or ballast tank breadths more than 60 per cent of the ship's breadth shall comply with the following additional requirements during cargo loading/unloading operations, including the intermediate stages thereof:

3.4.4.1 When the cargo loading/unloading operations are performed in port the corrected initial metacentric height is not to be less than 0,15 m and the positive intact stability is not to be less than 20°.

3.4.4.2 When the cargo loading/unloading operations are performed at sea and on roadstead all requirements of this Part of the Rules shall be met.

3.4.4.3 When determining correction for the effect of free surfaces of liquids an allowance shall be simultaneously made for maximum free surface effects in all cargo, ballast and consumable tanks.

3.4.4.4 If the requirements of 3.4.4.1 and 3.4.4.2 are not met, due to application of the requirements of 3.4.4.3, instructions covering the operational restrictions to satisfy the said requirements may be included into the Information on Stability upon agreement with the Register.

3.4.4.5 Instructions referred to in 3.4.4.4 shall be formulated with consideration for the following:

they shall be in a language understood by the crew member in charge of loading/unloading operations and shall be translated into English;

they shall not require more complicated mathematical calculations than those provided in the other sections of the Information on Stability;

they shall indicate the list of cargo and ballast tanks which may simultaneously have free surfaces at any stage of loading/unloading operations;

they shall include typical versions of loading/unloading operations to satisfy the stability requirements under any load condition specified in the Information on Stability. The versions shall contain lists of cargo and ballast tanks which may simultaneously have free surfaces during various stages of loading/unloading operations;

they shall provide instructions necessary for independent pre-planning loading/unloading operations, including:

- height of the ship's centre of gravity in graphical and/or tabular form which enables control of compliance with the requirements of 3.4.4.1, 3.4.4.2,
- the method of expeditious assessment of effect produced on the stability by the number of tanks which simultaneously have free surfaces at any stage of loading/unloading operations,
- description of means available on board for control and monitoring loading/unloading operations from the viewpoint of the effects on stability,
- the method used to monitor loading/unloading operations and to give early warning of possible impeding the stability criteria,

description of means available to suspend loading/unloading operations if the stability criteria are under the threat of being impeded,

information on the possibility and procedure of using shipboard computer and various automated systems to monitor loading/unloading operations (including systems of monitoring tank filling, shipboard computer software by which calculations of trim and stability are performed, etc.);

they shall provide for corrective actions to be taken in case of unexpected technical difficulties which can emerge in the course of loading/unloading operations and in case of emergency.

3.4.4.6 Provisions of the instructions formulated in accordance with 3.4.4.5 shall be specified in the Information on Stability and also in the computer software available on board, by which trim and stability calculations are performed. A copy of the instructions shall be kept at the loading/unloading control station.

3.4.5 The following requirements are applied to tankers of 5000 gross tonnage and more:

the contract for construction was concluded on 1 February 1999 or later; or

in default of contract for construction which keels were laid or they are at similar stage of construction on 1 August 1999 or later; or construction has been completed by 1 February 2002, or

which has undergone substantial conversion;

in respect of which the contract was concluded after 1 February 1999, or

in default of the contract, the work on substantial conversion began after 1 August 1999; or

which were completed after 1 February 2002.

3.4.5.1 Each oil tanker is to comply with requirements set forth in 3.4.5.1.1 — 3.4.5.1.2 (considering instructions in 3.4.5.1.3) for any operation draught under the worst possible loading and ballasting conditions (in accordance with good operation practice) including intermediate stages of operations with liquids. Under all conditions it is considered that there is a free surface of liquid in ballast tanks.

3.4.5.1.1 At port the adjusted initial metacentric height is to be not less than 0,15 m.

3.4.5.1.2 At sea:

.1 Adjusted initial metacentric height is to be not less than 0,15 m.

.2 The diagram of the static stability is to comply with the requirements of 5.2.1.1. and 5.2.1.2.

3.4.5.1.3 While calculating stability, each tank is considered to be fully loaded up to the level, at which the sum of the cargo volume moment in relation to the main plain and the inertia moment of free surface at the heel of 00 reach their maximum. The density of cargo shall fit the cargo carrying capacity at which
the rise of the transverse metacentre over the main plain reaches its minimum at 100% of stores and ballast (equal to 1% of all ballast tanks). In calculations is to be accepted the maximum value of inertia moment of the liquid free surface in ballast tanks. In calculations of the initial metacentric height, the correction for free surface of liquids is to be based on the respective inertia moments of the free surfaces at upright ship position. The arms of the stability diagrams may be corrected based on the liquid shift moments.

3.4.5.2 Implementation of the requirements in 3.4.5.1 is to be ensured by design measures. For the combination carriers additional simple operation instructions may be allowed. This instructions are to:

.1 be approved by the Register;
.2 contain the list of cargo and ballast tanks which may have free surfaces during any operations with liquids and in the range of possible densities of cargo, still the above mentioned stability criteria are met;
.3 be easily understandable for the officer responsible for operations with liquids;
.4 provide possibility of planning the sequence of operations with cargo and ballast;
.5 enable to compare real stability figures with the required criteria presented in graphics and tables;
.6 do not require comprehensive mathematical calculations from the officer responsible for operations with liquids;
.7 contain instructions in respect of corrective actions to be fulfilled by the officer responsible for the operations with liquids in case of deviations from recommended figures and in case of accidents;
.8 be highlighted in Information on Stability and hang out in the cargo operations control station and put into the ship software performing stability calculations.

3.5 FISHING VESSELS

3.5.1 Stability of fishing vessels shall be checked in service for the following loading conditions:

.1 departure for fishing grounds with full stores;
.2 arrival at a port from fishing grounds with full catch in holds and on deck, if provision is made for the deck cargo in the design, and with 10 per cent of stores;
.3 arrival at a port from fishing grounds with 20 per cent of catch in holds or on deck (if provision is made in the design for stowage of cargo on deck), 70 per cent of ice and salt rating and 10 per cent of stores;
.4 departure from fishing grounds to transfer the catch with full catch and amount of stores ensuring the ship’s draught up to the load line.

3.5.2 The amount of full catch is determined depending on the ship’s type, capacity of cargo spaces and stability characteristics. It shall correspond to the load line position approved by the Register and shall be specified in stability calculations, as well as in the Information.

3.5.3 For net fishing vessels, allowance is to be made for wet fishing nets on deck in the second, third and fourth loading conditions.

3.5.4 Stability of a ship, while being on fishing grounds, shall be checked for compliance with the weather criterion for the following loading conditions: a vessel engaged in fishing, with no catch in holds and the hatches of the holds open, catch and wet nets stowed on deck, 25 per cent of stores and full amount of ice and salt. For vessels where nets and catch are hauled in with the help of cargo booms, account shall also be taken of cargo which is hoisted, with the cargo weight equal to the boom safe working load. The amount of catch allowed to be stowed on deck shall be specified both in the vessel’s design and the Information.

3.5.5 The ship’s amplitude of roll in the loading condition specified in 3.5.4 is assumed to be 10° and the angle of heel at which the coaming of a cargo hatch immerses is regarded as the angle of the ship’s flooding through openings considered open. Wind pressure in this loading condition for vessels of unrestricted service is assumed as that for ships of restricted area of navigation I, the wind pressure for vessels of restricted area of navigation I as that for ships of restricted area of navigation II, the wind pressure for vessels of restricted area of navigation II as that for these ships reduced by 30 per cent.

3.5.6 The curve of statical stability for ships in the loading condition of 3.5.4 limited by the angle of flooding cutting it short need not comply with the requirements set forth in 2.2.1.

3.5.7 For fishing vessels, the corrected initial metacentric height, including the light ship condition, is not to exceed 0.05 m or 0.003 of the ship’s breadth, whichever is the greater.

3.5.8 Under all loading conditions, the ship’s stability is to conform to 3.1.2 — 3.1.5, 3.1.7 — 3.1.9 where the ships are used for processing fish and other living resources of the sea and have a crew on board of more than 12 persons engaged in catching and processing only. From the point of the above requirements the crew members in question are regarded as passengers.

3.5.9 In the case of icing the parameters of the static stability curve are to be in conformity with 2.2.

For ships designed prior to the present Rules being enforced, if they undergo reconstruction, major repair, alteration or modification, the requirements of 2.4.7 apply.
3.6 SPECIAL PURPOSE SHIPS

3.6.1 The stability of whale factory ships, fish factory ships and other ships used for processing the living resources of the sea and not engaged in catching the same is to be checked for the following loading conditions:

.1 ship with special personnel, full stores, and full cargo of tare and salt on board;

.2 ship with special personnel, 10 per cent of stores, and full cargo of its production on board;

.3 ship in the same loading condition as in .2, but with 20 per cent of production and 80 per cent of tare and salt on board;

.4 ship in the same loading condition as in .2, but with 25 per cent of stores and the cargo being processed on board.

3.6.2 The stability of research, expeditionary, hydrographic, training and similar ships is to be checked for the loading conditions below:

.1 ship with special personnel and full stores on board;

.2 ship in the same loading condition as in .1, but with 50 per cent of stores on board;

.3 ship in the same loading condition as in .1, but with 10 per cent of stores on board;

.4 ship in the same loading conditions as in .1, .2 and .3, but with full cargo on board if the carriage of the latter is envisaged.

3.6.3 The stability of special purpose ships is to be in accordance with 3.1.2 — 3.1.5, 3.1.7 — 3.1.9. From the point of view of the above requirements special personnel is to be regarded as passengers.

3.6.4 For special purpose ships that are similar to supply vessels, on agreement with the Register, the requirements for the static stability curve may be reduced, as stated in 3.11.5.

3.6.5 For whale factory ships, fish factory ships and other ships used for processing the living resources of the sea, the requirements of 3.5.7 concerning the initial metacentric height apply.

3.6.6 For whale factory ships, fish factory ships and other ships used for processing the living resources of the sea, the requirements of 3.5.9 for the static stability curve in the case of icing apply.

3.7 TUGS

3.7.1 General.

3.7.1.1 Stability of tugs shall be checked for the following loading conditions:

.1 ship with full stores;

.2 ship with 10 per cent of stores and for tugs provided with cargo holds, additionally;

.3 ship with full cargo in holds and full stores;

.4 ship with full cargo in holds and 10 per cent of stores.

3.7.1.2 In addition to compliance with the requirements of Section 2, the tugs shall have sufficient dynamic stability to withstand the heeling effect of an assumed transverse jerk of the tow line under the same loading conditions, that is the angle of dynamic heeling \( \theta_{dh} \) due to assumed jerk of the tow line shall not exceed the limits given below.

3.7.2 Tugs for inner and outer road.

3.7.2.1 The angle of dynamic heel for tugs shall not be greater than the angle of flooding or capsizing, whichever is less.

To meet this requirement, the following condition is to be satisfied:

\[
K_1 = \sqrt{|l_{d_cap}|/l_{dh}} \geq 1.00
\]  

(3.7.2.1)

where \( l_{d_cap} \) = arm of dynamical stability defined as an ordinate of the dynamic stability curve for a tug at the angle of heel equal to the angle of flooding (see 3.7.2.3) or capsizing (see 3.7.2.4), determined disregarding roll, whichever is less, in m;

\( l_{dh} \) = dynamic heeling arm characterizing the assumed jerk effect of the tow line, in m.

3.7.2.2 The dynamic heeling arm \( l_{dh} \), in m, shall be determined from the formula

\[
l_{dh} = \frac{f}{e} \left( 1 + \frac{2}{d} \right) \left( 1 + e^2 \right) \left( 1 + e^2 + b^2 \right)
\]  

(3.7.2.2-1)

where \( f \) is the height of the velocity hydraulic pressure head, in m.

The values of \( f \) are obtained from Table 3.7.2.2 depending on the power \( N_c \) of the ship’s main engines.

\[
e = 4.55x_{cm}/L_c
\]  

(3.7.2.2-2)

\[
b = \frac{a^2 + \sqrt{a^4 - 4(2d/B)^2}}{2d}
\]  

(3.7.2.2-3)

\( a \) and \( e \) are computed from the formulae:

\[
a = 0.2 + 0.3(2d/B)^2 \times \frac{\sqrt{\pi}}{1 + \sqrt{2B/d}}
\]  

(3.7.2.2-4)

\[
e = 0.145 + 0.2 \times \frac{\sqrt{\pi}}{2B} + 0.06 \times \frac{B}{2d}
\]  

(3.7.2.2-5)

3.7.2.3 When checking stability of tugs for the tow line jerk effect, the angle of flooding shall be determined assuming that all doors leading to engine
and boiler casings and to the upper deck superstructures, as well as the doors of all companionways to the spaces below the upper deck, irrespective of their design, are open.

3.7.2.4 When checking stability of tugs for the tow line jerk effect, no account shall be taken of icing and free surfaces of liquid cargoes.

3.7.2.5 If special appliances are available for shifting the tow hook downwards or abaft, with the tow line athwartships, the assumption of $x_H$ and $z_H$ differing from values given above is subject to special consideration by the Register in each particular case.

3.7.3 Tugs for ocean towage.

3.7.3.1 The angle of heel for tugs due to the tow line jerk under rolling shall not exceed the angle corresponding to the maximum of the statical stability curve or the angle of flooding, whichever is less. (The requirements of 3.7.2.3 are not applicable to tugs for ocean towage). To satisfy this condition the following requirement is to be met:

$$K_2 = \sqrt{\frac{I_{d_{\text{max}}}}{I_{d_{\text{th}}}}} - \Delta K \geq 1.0$$

(3.7.3.1-1)

where $I_{d_{\text{max}}}$ = ordinate of the dynamical stability curve at an angle of heel corresponding to the maximum of the statical stability curve or the angle of flooding, whichever is less, in m;

$I_{d_{\text{th}}}$ = dynamic heeling arm determined in compliance with 3.7.2.2, with $l_{d_{\text{th}}}$ assumed to be 0.20 m;

$\Delta K$ = component of $K_2$ used to allow for the effect of rolling on resultant angle of heel and determined from the formula

$$\Delta K = 0.039 \theta_0 \left[ \frac{1 + c^2}{b} - \frac{1}{e} \left( a - \frac{z_H}{B} \right) \right] \sqrt{\frac{h_0}{1 + 2 \frac{d}{B}}}$$

(3.7.3.1-2)

where $\theta_0$ is obtained in compliance with 2.1.3, in deg.;

c, b, a, e are computed in accordance with 3.7.2.2.

3.7.3.2 When checking stability of tugs:

.1 3.7.2.5 is valid;

.2 for curves of statical stability with two maxima or an extended horizontal region, the value of the angle at the first maximum or that corresponding to the middle of the horizontal region should be taken as the angle of maximum specified in 3.7.3.1;

.3 stability for the tow line jerk effect is to be checked taking no account of the free surfaces of liquid cargoes.

3.7.3.3 When checking stability of tugs for compliance with the requirements of Section 2 and this Chapter, the icing rates are assumed to be:

.1 for tugs specially designed for salvage operations, twice as much those given in 2.4;

.2 for other tugs, in accordance with 2.4.

3.7.3.4 Where a tug for ocean towage may be used for inner and outer road operations as well, compliance of such a tug with 3.7.2 is subject to special consideration by the Register.

3.8 VESSELS OF DREDGING FLEET

3.8.1 Working conditions.

"Working conditions" means operation of a vessel according to its purpose within the prescribed operation zones:

.1 coastal zone up to 20 miles from the coast;

.2 zone including the prescribed area of navigation of a vessel.

3.8.2 Loading conditions.

Depending on the type of a vessel of dredging fleet and its dredging gear the following conditions of loading are to be considered.

3.8.2.1 For vessels of dredging fleet of all types during voyages:

.1 vessel with full stores, without spoil, dredging gear being secured for sea;

.2 vessel in the same loading condition as in .1, but with 10 per cent of stores.

3.8.2.2 In operating conditions for hopper dredgers and hopper barges:

.1 vessel with full stores, with spoil in the hopper, dredging gear being secured for sea;

.2 vessel in the same loading condition as in .1, but with 10 per cent of stores.

For hopper dredgers equipped with grab cranes additional loading conditions, such as with grab cranes operating from one side and crane boom being in the athwartship plane, with spoil in the grab, with maximum loading moment and also with the highest position of the boom with due regard to initial heel are to be considered. These conditions are to be considered for a vessel with 10 per cent of stores and full stores, both with spoil and without it.

Notes: 1. The mass of spoil in the grab is taken to be 1.6V t where $V$ is the volume of the grab, in m$^3$.

2. The quantity of spoil in the hopper and the position of the centre of gravity is to be determined assuming that the hopper is filled with homogeneous spoil up to the level of the upper discharge holes or the upper coaming edge, if the discharge holes are not provided, with the vessel having a draught up to the load line permitted when dredging.

3.8.2.3 In operating conditions for dredgers equipped with bucket ladder:

.1 vessel with full stores, with spoil in buckets, ladder being secured for sea;

.2 vessel in the same loading condition as in .1, but with 10 per cent of stores.

Note. Spoil is taken into the buckets of the upper part of the ladder (from upper to lower drum). The mass of spoil in each bucket is taken to be 2V t where $V$ is the full volume of the bucket, in m$^3$.

3.8.2.4 In operating conditions for dredgers, other than those equipped with bucket ladder:

.1 vessel with full stores, with dredging gear in the highest position possible in normal operation;
.2 vessel in the same loading condition as in .1, but with 10 per cent of stores.

For dredgers equipped with grab cranes the additional loading conditions are to be considered in compliance with 3.8.2.2.

Notes: 1. Spoil pipeline within the vessel is assumed to be filled with spoil having density equal to 1.3 t/m³.
2. The mass of spoil in the grab (bucket) is assumed to be 1.61V t where V is the volume of the grab (bucket), in m³.

3.8.3 Form stability calculation and inclining test.

3.8.3.1 When determining the arms of form stability for vessels of dredging fleet, the manholes of air spaces may be considered closed irrespective of the coaming height if they are fitted with covers conforming to 7.9 of Part III "Equipment, Arrangements and Outfit".

3.8.3.2 Hopper barges, dredgers and other vessels in which the watertight integrity of their hoppers cannot be achieved due to the structural peculiarities may be inclined with water in the hoppers which communicates easily with sea water.

3.8.4 Checking of stability in working conditions and during voyages.

3.8.4.1 Stability of vessels of dredging fleet during voyages is to be calculated having regard to the area of navigation prescribed to the vessel concerned. To be stated both in the specification and in the Information on Stability are the conditions of voyages, if any (ballast water available, extent to which the dredging gear is dismantled, the position of the ladder, the possibility of spoil transportation in the hopper beyond the limits of 20-mile coastal zone, etc.). The dredgers equipped with a ladder may undertake voyages in the unrestricted area of navigation only with the bucket chain dismantled.

3.8.4.2 When calculating stability of vessels of dredging fleet under working conditions, the following is assumed:

.1 in zone 1 wind pressure is to be taken: for vessels of unrestricted service as for ships of restricted area of navigation I; for vessels of restricted area of navigation I as for this area, but reduced by 25 per cent; for other areas of navigation, as for restricted area of navigation II; amplitude of roll, as for restricted areas of navigation;

.2 in zone 2 wind pressure and amplitude of roll are to be taken in accordance with area of navigation prescribed for the vessel concerned.

3.8.4.3 The amplitude of roll of vessels of dredging fleet having no cut-out in the hull, bilge keels, bar keel is determined by Formula (2.1.3.1) and Tables 2.1.3.1-1, 2.1.3.1-3 and 3.8.4.3-1.

For restricted areas of navigation I and II the amplitude of roll obtained from Formula (2.1.3.1) is to be multiplied by the factor X₃ whose values are given in Table 3.8.4.3-2.

The bilge keels or bar keel are to be taken into account in compliance with 2.1.3.2.

For vessels with sharp bilges the provisions of 2.1.3.3 shall be taken into consideration.

For hopper dredgers and hopper barges having bottom recesses for flaps factor X₁ is determined from the ratio B/d multiplied by coefficient (V + Vₓ)/V where V is the volume displacement of the vessel with no regard to recess, in m³; Vₓ is the volume of bottom recess, in m³.

3.8.4.4 Stability of dredgers and hopper dredgers equipped with grab cranes when additional loading conditions (see 3.8.2.2) are considered is to meet the requirements of 4.1.

3.8.4.5 Stability of hopper dredgers and hopper barges whose construction of bottom flaps and their drive does not prevent the possibility of spoil discharge from one side shall be checked with due regard to such discharge only for compliance with weather criterion as specified in 3.8.4.6 and 3.8.4.7 for the most unfavourable loading condition out of .1 and .2 (see 3.8.2.2):

.1 where spoil in the hopper, having density less than 1.3 t/m³ with static heeling angle θₑₜₓ; and amplitude of roll 10°;

.2 where spoil in the hopper, having density equal to, or more than, 1.3 t/m³ with regard to dynamic character of discharge, with amplitude of roll equal to the sum of 10° and the maximum amplitude of vessel’s rolling θs, with respect to statical inclination just after the spoil discharge.

The value of θs, in deg., is computed from the formula

$$\theta_s = 0.20 \frac{D}{B}$$

(3.8.4.5.2)

The recommended procedure for determination of capsizing moment is given in 1.2 of Appendix 2.

3.8.4.6 The value of horizontal shifting of the vessel’s centre of gravity yg, in m, when discharging half the spoil from one side out of fully loaded hopper, is computed from the formula

$$y_g = \frac{P y}{2\Delta}$$

(3.8.4.6-1)

where

- \( P \) = total mass of spoil in the hopper, in t;
- \( y \) = distance from the centre of gravity of spoil discharged from one side to the centre line, in m;
- \( \Delta = \Delta_{\text{max}} - \Delta / 2 \).

\( \Delta_{\text{max}} \) = vessel’s displacement prior to spoil discharge, in t.

3.8.4.7 The vessel’s curves of statical and dynamical stability, in m, are calculated from the formulae:

$$l_1 = l - y_g \cos \theta$$

(3.8.4.7-1)

$$l_{d1} = l_d - y_g \sin \theta$$

(3.8.4.7-2)

where \( l \) and \( l_d \) = arms of statical and dynamical stability with the vessel’s displacement \( \Delta_{\text{max}} \), calculated assuming that the vessel’s centre of gravity coincides with the centre line.

3.8.4.8 When spoil is discharged by long chute or conveyor methods, stability of a dredger shall be checked for the case of statical action of the moment due to the mass forces of the long chute or the conveyor (in the athwartship plane) filled with spoil (with no regard to the waves and wind effects). In this case, the vessel’s stability is considered to be adequate, if maximum statical heel is not more than the angle of flooding or the angle at which the freeboard becomes equal to 300 mm, whichever is less.

3.8.5 Effect of liquid cargoes.

When calculating the effect of liquid cargoes as specified in 1.4.7 for hopper dredgers and hopper barges, it shall be assumed that:

.1 for a vessel with spoil having density over 1.3 t/m³, the spoil is regarded as solid non-overflowing cargo; the arms of statical and dynamical stability are determined for the constant displacement and position of the spoil centre of gravity in the hopper;

.2 for a vessel with spoil having density equal to, or less than, 1.3 t/m³ the spoil is regarded as liquid cargo; the arms of statical and dynamical stability are determined at the variable displacement and position of the spoil centre of gravity, taking account of the spoil flowing overboard and reduction of the vessel’s draught.

No such calculation is carried out if the vessel is provided with a longitudinal bulkhead in the hopper, the spoil in the latter case being regarded as solid cargo.

.3 for a vessel without spoil, the hopper is in communication with sea water, that is flaps or valves are open. The arms of statical and dynamical stability are determined for the constant displacement (as for a damaged vessel).

3.8.6 Effect of dredging gear icing.

When estimating the effect of icing of vessels of dredging fleet, the horizontal projection of dredging gear is added to the area of horizontal projection of decks (the centre line projection being included in the windage area). The vertical moment due to this additional ice load is determined by the centre of gravity elevation of the projection of the dredging gear in its working or secured for sea position to the centre line.

3.8.7 Curve of statical stability.

3.8.7.1 The curve of statical stability of hopper dredgers and hopper barges during voyages and under working conditions is to meet the requirements of 2.2.

3.8.7.2 The curve of statical stability of dredgers equipped with bucket ladder for all loading conditions specified in 3.8.2, as well as when taking account of icing, shall comply with the following requirements:

.1 the angle of vanishing stability \( \theta_v \) shall be not less than 50°;

.2 the maximum arm of the curve with angle \( \theta_m \) of not less than 25° is to be:

when vessels are operating in zone 1, not less than 0,25 m;

during voyages, passages and when operating in zone 2, not less than 0,4 m.

3.8.7.3 For bucket dredgers having \( B/D > 2,50 \), angles \( \theta_v \) and \( \theta_m \) may be reduced as compared to those required in 3.8.7.2 by the following values:

.1 for the angle of vanishing stability, by the value \( \Delta \theta_v \) determined from the following formula depending on the \( B/D \) ratio and the weather criterion \( K \):

$$\Delta \theta_v = 25 \left( \frac{B}{D} - 2.5 \right)(K - 1)$$

Assumptions: \( B/D = 3,0 \) where \( B/D > 3,0 \) and \( K = 1,5 \) where \( K > 1,5 \). The value of \( \theta_v \) is rounded off to the nearest integer;

.2 for the angle corresponding to the maximum arm of the curve, by a value equal to half the reduction value of the angle of vanishing stability;

.3 for dredgers of unrestricted service the reduction of angles \( \theta_m \) and \( \theta_v \) is not permitted.

3.9 SHIPS UNDER 20 M IN LENGTH

3.9.1 When determining the arms of form stability, it is possible to take into consideration
deckhouses of the first tier only which conform to 1.4.2.3.1 and from which there is either an additional exit to the deck above or exits to both the sides.

3.9.2 Stability as to weather criterion is not to be checked. However, for the operation of the ships, restrictions on the distance to the port of refuge and the sea state should be introduced.

For small ships, restrictions on the area and conditions of navigation shall be set down and included in the Information on Stability.

.1 For ships of less than 15 m in length and passenger ships of less than 20 m in length restricted area of navigation III may be prescribed.

For ships 15 m to 20 m in length, other than passenger ships, an area of navigation not higher than II may be prescribed.

.2 Non-passenger ships of less than 15 m in length may proceed to sea and be en route at sea state not more than 4, ships 15 m to 20 m in length — not more than 5.

.3 Passenger ships of less than 20 m in length may proceed to sea and be en route at sea state not more than 3.

.4 Having regard to stability and seaworthiness of ships and depending on the reliable provision of the area of navigation concerned with forecasts, as well as on the operating experience for ships of similar type and the same or approximately the same dimensions, available for this area of navigation, the Register may change the restrictions on the area of navigation and permissible sea state specified in 3.9.2.1 to 3.9.2.3.

.5 When determining maximum permissible sea state for small craft carried on depot ships (for example, small fishing boats carried on mother ships), in addition to the provisions of 3.9.2.2 and 3.9.2.3, maximum sea state at which the craft can be safely lifted on board the depot ship shall be taken into account.

.6 At the discretion of the Register, additional restrictions shall be introduced in zones of special sea conditions.

Referred to such zones are:
zones of surf (breaking) waves;
zones of local abrupt increase in wave height and steepness (bars in estuaries, tossing, etc.).

Zones of special sea conditions are set on the basis of the data of local hydrometeorological and hydrographic offices.

3.9.3 For ships having \( B/D > 2 \) the permissible reduction of the angle of vanishing stability is to be determined from Formula (2.2.2.1) for the constant \( K = 1.5 \).

3.9.4 Cutting the static stability curve short at the angle of flooding permitted by 2.2.4 is prohibited at heeling angles less than 40°.

3.9.5 The static stability curve of a fishing vessel, when on fishing grounds, under the loading conditions stated in 3.5.4 may not conform to the requirements of 2.2.1 for the maximum arm and the requirements of 2.2.4 for the conventional angle of vanishing stability. Under those loading conditions, the maximum arm of the static stability curve is not to be less than 0.2 m.

3.9.6 Under all loading conditions, the corrected initial metacentric height is not to be less than 0.5 m, except for the light ship condition (see 2.3.1) and the fishing vessels when under loading conditions stated in 3.5.4 for which it is not to be less than 0.35 m.

3.9.7 The initial stability of fishing vessels hauling in the nets and catch with cargo booms is to be sufficient (under loading conditions stated in 3.5.4 as well) to ensure that the static heel angle of the ship when handling the nets and operating the cargo boom at its maximum outreach would not exceed 10° or the angle at which the deck is immersed (whichever is less).

3.9.8 Operation of the ships under conditions of eventual icing is not, in general, to be permitted.

Where due to the mode of operation and purpose the possibility of sailing into regions where icing might occur cannot be completely ruled out for a ship, the values of initial metacentric height and other parameters of static stability curves drawn taking icing into consideration are not to be less than those stated in 2.2, 3.9.3, 3.9.4 and 3.9.6.

3.9.9 Information on Stability is to include indications of the permissible speed and angle of rudder shifting in turning. The permissible values of initial turning speed and angle of rudder shifting are to be determined by tests during acceptance trials of the leading ship assuming that the list of the ship in steady turning shall not exceed:

.1 for non-passenger ships, the angle at which the freeboard deck is immersed or 12°, whichever is less;

.2 for passenger ships, taking account additionally of the effect of the simulated heeling moment due to passengers crowding to one side (to be determined in accordance with 3.1.2), the angle at which the freeboard deck is immersed or 15°, whichever is less.

The Register may apply the provisions of 3.9.9.2 to the stability of non-passenger ships (for instance, when persons not belonging to the ship’s crew are on board).

The requirements of 3.1.3 and 3.1.4 are not applicable to ships of less than 20 m in length.

3.9.10 The initial stability of passenger ships is to be checked for conformity with 3.1.2. The angle of heel due to passengers crowding to one side is not to be greater than the angle corresponding to 0.1 m freeboard before the deck is immersed or 12°, whichever is less.

If necessary, the Register may apply the requirements of 3.1.2 to the stability of non-passenger ships (for instance, when persons are on board who are not members of the regular crew). In this case, the heel is determined on the assumption that all persons crowd to one side who are not engaged in handling the ship.
3.9.11 In the Information on Stability it should be specified that when the ship is under way in following seas, with the wave length equal to, or exceeding the length of the ship, its speed \( v_r \), in knots, is not to be greater than obtained from the formula

\[
v_r = 1.4 \sqrt{L}
\]

where \( L \) = length of the ship, in m.

3.9.12 Application of the requirements of 3.7 to the stability of tugs under 20 m in length is subject to special consideration by the Register in each case.

3.10 CONTAINER SHIPS

3.10.1 In calculating stability of container ships, the vertical centre of gravity position of each container shall be taken equal to half the height of the container of the type concerned.

3.10.2 Stability of container ships shall be checked for the following loading conditions:

1. ship with maximum number of containers, each loaded container having the mass equal to one and the same part of the maximum gross mass for each type of containers, with full stores and, where necessary, with liquid ballast at the draught up to the summer load line;

2. ship in the same loading condition as in .1, but with 10 per cent of stores;

3. ship with maximum number of containers, each loaded container having the mass equal to 0.6 of the maximum gross mass for each type of containers, with full stores and, where necessary, with liquid ballast;

4. ship in the same loading condition as in .3, but with 10 per cent of stores;

5. ship with containers, each loaded container having the mass equal to the maximum gross mass for each type of containers, with full stores and, where necessary, with liquid ballast at the draught up to the summer load line;

6. ship in the same loading condition as in .5, but with 10 per cent of stores;

7. ship with maximum number of empty containers, but with full stores and with liquid ballast;

8. ship in the same loading condition as in .7, but with 10 per cent of stores;

9. ship with no cargo, but with full stores;

10. ship in the same loading condition as in .9, but with 10 per cent of stores.

When determining the arrangement of containers on board under the loading conditions mentioned above, the allowable loads upon the hull structures should be considered.

3.10.3 If other loading conditions different from those listed in 3.10.2 are provided in the technical assignment, stability calculations are also to be made for such conditions with full stores and 10 per cent of stores, and with ballast water, where necessary.

3.10.4 Stability of container ships for any loading condition with containers shall be such that a heeling angle on steady turning or under the effect of continuous beam wind as determined from the statical stability curve does not exceed half the angle at which the freeboard deck immerses; in any case, the heeling angle shall not exceed 15°.

Where the deck cargo of containers is located on cargo hatch covers only, on agreement with the Register, the angle at which the hatch coaming edge or a container is immersed, whichever angle is less, may be adopted instead of the angle at which the upper deck edge is immersed (provided the containers protrude beyond the coaming in question).

3.10.5 The heeling moment on steady turning is determined, in kN·m, from the formula

\[
M = \frac{0.037 \Delta v_r^2}{L} (x_g - \frac{d}{2})
\]

(3.10.5)

where \( v_r \) = ship’s speed before entering into manoeuvre, in knots.

3.10.6 The heeling moment due to wind pressure used to determine the heeling angle in conformity with 3.10.4 shall be calculated by Formula (2.1.2.1) in which \( p_c \) is taken equal to 0.6 of the values given in Table 2.1.2.2 for ships of unrestricted service.

3.10.7 All calculations of statical heeling angle under the effect of beam wind or turning shall be made with no regard for icing, but having regard for the free surface effect of liquid cargoes as required by 1.4.7.

3.10.8 The corrected initial metacentric height of container ships under loading conditions with containers on board and icing disregarded is not to be less than 0.15 m.

3.10.9 Container ships shall be equipped with tanks or other specific facilities approved by the Register, which permit to check the initial stability of the ship, bearing in mind the Register approved requirements for the in-service inclining test.

3.10.10 The requirements of this Part are applicable to ships of other types appropriated for the carriage of cargoes in containers on deck.

Where, acting in line with 3.10.2.1 and 3.10.2.5, it is not possible to load the ship to the summer load line the ship may be considered for the relevant loading conditions at the maximum draft possible.

3.11 SUPPLY VESSELS

3.11.1 The present Chapter applies to supply vessels 24 m to 100 m in length. If the length of the supply vessel is over 100 m, the requirements for its stability are to be specially considered by the Register.
3.11.2 The stability of supply vessels is to be checked considering the trim that accompanies the inclination.

3.11.3 In addition to the loading conditions listed in 1.4.8.2, the stability of supply vessels is to be checked for the following loading conditions:

1. ship with full stores and full deck cargo having the greatest volume per weight unit, prescribed by the technical assignment in the most unfavourable case of distribution of the rest of the cargo (when pipes are carried as deck cargo — taking the water entering the pipes into consideration);
2. ship in the same loading condition as under 1, but with 10% per cent of stores.

3.11.4 The volume of water \( V_a \) lingering in the pipes carried on deck is to be determined by Formula (3.11.4) proceeding from the total volume of the pipe pile \( V_{pt} \) and the ratio of the freeboard amidships \( f \) to the ship’s length \( L \). The volume of a pipe pile is to be regarded as the sum of the inner volumes of the pipes and spaces between them:

\[
V_a = \begin{cases} 
0.3 V_{pt} & \text{if } \frac{f}{L} \leq 0.015; \\
0.5 - \frac{40}{3} \frac{f}{L} V_{pt} & \text{if } 0.015 < \frac{f}{L} < 0.03; \\
0.1 V_{pt} & \text{if } \frac{f}{L} \geq 0.03. 
\end{cases} 
\]  

(3.11.4)

Reducing of the design value for the volume of water in the pipes, where they are plugged or where the pipe pile is higher than 0.4 of the draught, should be determined on agreement with the Register.

3.11.5 In the case of supply vessels having \( B/D > 2 \), the angle corresponding to the maximum arm of the curve of statical stability may be reduced to 25° and the angle of vanishing stability may be reduced to 50°; the maximum arm \( l_{max} \) in m, and the weather criterion \( K \) values are not to be less than the greatest values determined from the following formulae:

\[
l_{max} \geq 0.25 + 0.005(60° - \theta) \]  

or \( l_{max} \geq 0.25 + 0.01(30° - \theta) \);  

\[K \geq 1 + 0.1(30° - \theta) \]  

or \( K \geq 1 + 0.05(60° - \theta) \).

3.11.6 When the effect of icing is computed, the upper surface of the deck cargo is to be considered as the deck, and its lateral area projection above the bulwark — as a part of the design windage area. The icing allowance is to be assumed in accordance with Chapter 2.4 "Allowance for Icing".

3.11.7 For supply vessels operating in areas where icing is possible, the ice and water in the pipes should be considered simultaneously when making stability calculations for the carriage of pipes on deck. The icing of pipes carried on deck should be determined as follows: the mass of ice \( M_{ice} \) inside the pipe pile is determined from the formula

\[
M_{ice} = \sum_{i=1}^{k} m_{ice} n_i
\]

where \( m_{ice} \) = mass of ice per one pipe, obtained from Table 3.11.7; \( n_i \) = quantity of pipes of the \( i \)-th diameter; 

\( k \) = number of standard pipe sizes with regard to diameter.

When calculating the mass of ice on the outer surfaces of a pipe pile, the area of the upper and the side surfaces should be determined taking the curvature of the pipe surface in the pile into consideration. The rate of icing is adopted in accordance with 2.4.

3.11.8 Supply vessels which may be engaged in towing operations as well are to comply with Chapter 3.7 "Tugs".

Besides, arrangements for quick releasing of the tow line are to be provided on board.

3.11.9 Supply vessels which may be engaged in operation of lifting the anchors of mobile offshore drilling units as well are to comply with the requirements of 4.1.7.1.1 and 4.1.7.1.4. The heeling moment due to wind pressure \( M_w \) and the roll amplitude of the supply vessel are to be determined in accordance with procedures agreed with the Register.

3.12 SHIPS OF RIVER-SEA NAVIGATION

3.12.1 Stability of ships of river-sea navigation (restricted areas of navigation II C1 and III C1 according to 2.2.5 of Part I "Classification") shall meet the requirements of Sections 1 and 2, as well as additional requirements of Section 3 (depending on the purpose of the ship).

The rated values of wind pressure and factor \( Y \) are to be taken as those for ships of restricted area of navigation II with regard to 3.12.5.

Besides, the stability of dry cargo ships shall be checked by acceleration criterion in compliance with 3.12.3.

3.12.2 Stability of dry cargo ships and tankers.

1. The stability of dry cargo ships shall be checked for the loading conditions listed in 3.2, as well as for the case of holds partly filled with heavy cargoes (ore, scrap metal, etc.) at the draught to the load line.

<table>
<thead>
<tr>
<th>Pipe diameter, m</th>
<th>0.05</th>
<th>0.1</th>
<th>0.2</th>
<th>0.3</th>
<th>0.4</th>
<th>0.5</th>
<th>0.6</th>
</tr>
</thead>
<tbody>

<td>2.1</td>
<td>26.7</td>
<td>125</td>
<td>376</td>
<td>899</td>
<td>1831</td>
</tr>
</tbody>
</table>

Note. For pipes of intermediate diameters, the mass of ice is determined by interpolation.
.2 The stability of tankers shall be checked for loading conditions specified in 3.4.

3.12.3 The stability as concerns the acceleration criterion $K^a$ is considered satisfactory if in the loading condition under consideration the calculated acceleration (in fractions of $g$) does not exceed the permissible value, i.e. the following condition is fulfilled:

$$K^a = 0,3a_{\text{tot}} \geq 1$$  \hspace{1cm} (3.12.3)

where $a_{\text{tot}} = \text{calculated value of acceleration (in fractions of } g)$ obtained from the formula

$$a_{\text{tot}} = 1,1 \times 10^{-3} B m^2 \theta_v$$

$m = \frac{m_0}{\sqrt{h_0}}$ = regulated frequency of natural oscillations of the ship;

$m_0 = \text{coefficient obtained from Table 3.12.3 depending on}$

$\frac{B}{\sqrt{\pi} z_e}$;

$\theta_v$ = calculated amplitude of roll determined in accordance with 2.1.3 and 3.12.5, in deg.;

$V$ = displacement of the ship, in m$^3$.

<table>

3.12.4 In certain cases, upon well-grounded presentation by the Shipowner, Register may allow the operation of the ship with the the criterion $K^a < 1$. In this case, an additional wave height restriction is to be introduced. The permissible wave height with 3 per cent probability of exceeding level is estimated proceeding from the value of the criterion $K^a$ as given in Table 3.12.4.

4 REQUIREMENTS FOR THE STABILITY OF FLOATING CRANES, PONTOONS, DOCKS AND BERTH-CONNECTED SHIPS

4.1 FLOATING CRANES

4.1.1 Working conditions.

The operation of a floating crane (cargo handling operations and carriage of cargoes on deck) is permitted within restricted areas of navigation II and III.

4.1.2 Loading conditions.

4.1.2.1 Stability of a floating crane in a working condition having no regard for icing shall be checked for the following loading conditions:

.1 with full load on its hook at the maximum loading moment:
  - with full load and full stores;
  - with full load and 10 per cent of stores;
  - without load and with full stores;

.2 without load on the hook at the highest position of the boom:
  - with full load and full stores;
with full load and 10 per cent of stores; without load and with full stores; without load and with 10 per cent of stores; in case of load drop.

The boom position of the slewing crane is assumed to be in the plane perpendicular to the centre line.

For non-slewing cranes intended for boom operation in the longitudinal plane possibility of unsymmetrical loading on the hooks, if it is permitted by the design of crane, is to be taken into account.

The design centre of gravity position of the load on hook is assumed to be at the point of its suspension to the boom.

For the case of load drop stability is to be checked for the most unfavourable loading condition as regards stability with a load on hook taking account of possible unsymmetrical distribution of cargo on deck.

4.1.2.2 During the voyage, the stability of a floating crane shall be checked with due regard for icing with the boom secured for sea under the following loading conditions:

1. with full load and full stores;
2. with full load and 10 per cent of stores;
3. without load and with full stores;
4. without load and with 10 per cent of stores.

4.1.2.3 In non-working condition, the stability of a floating crane shall be checked with regard to icing for the most unfavourable loading condition as regards stability stipulated in 4.1.2.2.

4.1.3 Calculation of form stability.

Calculations of the arms of form stability shall be made taking the initial trim into consideration.

4.1.4 Calculation of windage area.

4.1.4.1 The designed windage area component $A_{w}$ is:

1. for continuous-walled structures, deck machinery, arrangements, etc. — a projected area restricted by the outline of a structure, item of machinery, arrangement, etc.;
2. for a lattice type structure — a projected area limited by the crane outline with apertures between girders deducted;

3. for structure comprising several beams of equal height, located, one after another (Fig. 4.1.4.1.3):

$$\begin{align*}
A_{U} & = A_{U} = A_{U} = A_{U} = A_{U} \\
\alpha < h & = A_{U} = A_{U} + 0.5 (A_{U} + A_{U} + A_{U}) \\
\alpha = 2h & = A_{U} + A_{U} + A_{U}
\end{align*}
$$

Fig. 4.1.4.1.3

the fore beam projected area if the beam spacing is less than the fore beam height;

the total area of the fore beam plus 50 per cent of areas of subsequent beams, if the beam spacing is equal to, or greater than, the beam height, but less than the double height of the beam;

the total projected area of all beams if the beam spacing is equal to, or greater than, the beam double height.

If the beams are not equal in height, parts of subsequent beams not overlapped by those lying before them shall be fully taken into account.

4.1.4.2 The design arm of windage area $z_{w}$, in m, shall be obtained from the formula

$$z_{w} = \frac{\Sigma k_{i} n_{i} A_{w_{i}} z_{i}}{\Sigma k_{i} n_{i} A_{w_{i}}} \quad (4.1.4.2)$$

where $z_{i}$ = height of the geometrical centres of areas $A_{w_{i}}$ within a given zone above the waterline.

The values of $z_{w}$ are permitted to be determined with due regard for trim.

4.1.4.3 The aerodynamic flow coefficient $k_{i}$ for components of the crane windage area shall be assumed in accordance with Table 4.1.4.3.

4.1.4.4 The values of zone coefficient $n_{i}$ with regard to the change of the wind velocity head depending on the height of zone windage area centre of gravity position above the waterline shall be taken according to Table 4.1.4.4.

### Table 4.1.4.3

<td>90 to 100</td>
<td>2.1</td>
</tr>
</tbody>
</table>

4.1.4.5 For each condition of the floating crane (working, non-working, voyage, passage) it is recommended that the windage area of non-continuous surfaces, rails, spars, rigging and various miscellaneous surfaces be taken into account by increasing the maximum total windage area of continuous surfaces by 2 per cent (with regard to coefficients \( k_i \) and \( n_i \)) and the statical moment of this area, by 5 per cent.

In icing conditions these increase values shall be taken 4 and 10 per cent, or 3 and 7.5 per cent, respectively, depending on the icing rates.

In so doing, the values of non-continuous surface windage areas and of statical moments of these areas are assumed constant for all loading conditions of the appropriate crane position.

4.1.4.6 The design windage area of the cargo on hook is determined by its actual outline with due regard for its aerodynamic coefficient and maximum lifting height, i.e. similarly to 4.1.4.1, taking account of 4.1.4.3 and 4.1.4.4.

The centre of application of the wind pressure to the load to be lifted shall be assumed at the point of load suspension to the hook.

With no actual data available, the design windage area of cargo on the hook is adopted in accordance with Table 4.1.4.6.

4.1.5 Calculation of roll amplitude.

4.1.5.1 The amplitude of roll, in deg., of a floating crane is to be determined from the formula

\[
\theta_r = X_{1,2} X_3 Y + \Delta \theta_r
\]

(4.1.5.1-1)

where \( X_{1,2} \), \( X_3 \) = dimensionless factors;

\( Y \) = factor, in deg.;

\( \Delta \theta_r \) = correction, taking into account the floating crane centre of gravity above the waterline, in deg.

Table 4.1.5.1-1

<table>
<thead>
<tr>
<th>Factor ( X_{1,2} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \frac{B}{C_{ld}} )</td>
</tr>
<tr>
<td>( \frac{h_{3y_k}}{\sqrt{C_{ld} B_d}} \geq 0.50 )</td>
</tr>
<tr>
<td>( \frac{h_{3y_k}}{\sqrt{C_{ld} B_d}} &lt; 0.25 )</td>
</tr>
</tbody>
</table>

Note. At \( 0.25 < \frac{h_{3y_k}}{\sqrt{C_{ld} B_d}} < 0.50 \) the values of \( X_{1,2} \) shall be obtained by linear interpolation.

Windage area of cargo on hook \( k A_{oc} \)

<table>
<thead>
<tr>
<th>Mass of cargo, t</th>
<th>( k A_{oc} ) m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>12</td>
</tr>
<tr>

<td>54</td>
</tr>
<tr>
<td>160</td>
<td>58</td>
</tr>
<tr>
<td>180</td>
<td>60</td>
</tr>
</tbody>
</table>

Note. Intermediate values of \( k A_{oc} \) shall be determined by linear interpolation.

The values of factor \( X_{1,2} \) shall be taken from Table 4.1.5.1-1 depending on the ratios of \( \frac{B}{C_{ld} B_d} \) and \( \frac{h_{3y_k}}{\sqrt{C_{ld} B_d}} \).

Wave height with 3 per cent probability of exceeding level \( h_{3y_k} \) is to be assumed in accordance with sea state conditions under which the operation of a crane is allowed (working condition) or it is to be taken depending on the area of navigation as given in Table 4.1.10.2 (voyage, passage).

The values of factor \( X_3 \) shall be taken from Table 4.1.5.1-2.

The values of factor \( Y \) shall be taken from Table 4.1.5.1-3 depending on characteristic \( F \).

The value of \( F \) is obtained from the formula

\[
F = n \sqrt[4]{\frac{h_{3y_k}}{C_{ld} B_d}}
\]

(4.1.5.1-2)
### Table 4.1.5.1-2

</tbody>
</table>

where \(n\) = factor equal to:
- 0.414 for a floating crane with the boom parallel to the centre line;
- 0.331 for a floating crane with the boom perpendicular to the centre line.

Correction \(\Delta \theta_r\), in deg., is determined from the formula:

\[
\Delta \theta_r = 68 \frac{h_{359}}{\sqrt{C_Bd}} F \left[ \frac{z_g - d}{\sqrt{C_Bd}} \right] - 0.41 \left( \frac{B}{\sqrt{C_Bd}} - 2.1 \right). \tag{4.1.5.1-3}
\]

#### 4.1.5.2 Where the roll amplitude of a floating crane during the voyage \(\theta_d\), obtained in compliance with 4.1.5.1 exceeds the angle of deck immersion \(\theta_d\) or the angle at which the middle of midship frame bilge comes out of water \(\theta_b\), the design roll amplitude, in deg., shall be determined from the following formulae:

1. at \(\theta_d < \theta_b \leq \theta_b\)
   \[\theta_r = (\theta_d + 50)/6; \tag{4.1.5.2.1}\]

2. at \(\theta_d < \theta_b \leq \theta_d\)
   \[\theta_r = (\theta_d + 50)/6; \tag{4.1.5.2.2}\]

3. at \(\theta_d > \theta_b\) and \(\theta_r > \theta_d\)
   \[\theta_r = (\theta_d + \theta_b + 40)/6. \tag{4.1.5.2.3}\]

#### 4.1.5.3 The roll amplitude may be determined from the model test data

#### 4.1.6 Allowance for icing

The mass of ice per square metre of the area located 10 m above the waterline is to be taken equal to half the values specified in 2.4.3 to 2.4.5.

In this case, the windage area and the height of the centre of the windage area shall be determined as follows:

1. for loading condition with minimum draught, in compliance with loading conditions to be checked as required in 4.1.2.2;
2. for loading condition selected for stability checking, in compliance with 4.1.2.3.

#### 4.1.7 Stability of a floating crane in working condition

#### 4.1.7.1 Stability of a floating crane is considered adequate provided that:

1. the angle of heel due to the combined effect of the initial heeling moment (due to the load on its hook or a balance weight in case there is no load on the hook, etc.), statical effect of wind and roll does not exceed the angle at which the reliable operation of the crane is ensured (see 4.1.7.2) or the angle, at which the deck immerses or the middle of midship frame bilge comes out of water, whichever is less. In any case, this angle should not exceed 8° for floating cranes intended for operation in seaway and 6° for floating cranes not designed for such operation. In this case, the vertical distance of the openings determining the angle of flooding in the working condition from the actual waterline shall be not less than 600 mm.

For floating cranes which operate reliably at the large angles of heel, the allowable angle of heel is subject to special consideration by the Register in each case;

2. maximum arm of statical stability curve is not less than 1.0 m with the angle of heel not less than 14°.
and the limit of positive statical stability (vanishing stability) is not less than 25\(^{\circ}\).

3 Capsize moment \( M_c \), determined with regard to the combined effect of load drop and roll is at least twice the heeling moment due to wind pressure \( M_{e,w} \).

4 Angle of dynamic heel due to the combined effect of load drop, wind and roll is at least 1° less than the angle of flooding in working condition.

### 4.1.7.2 The angle of heel at which the reliable operation of the crane is ensured shall correspond to the delivery specifications of the crane.

### 4.1.7.3 The angle of heel, in deg., due to the combined effect of the initial heeling moment, statical wind effect and rolling shall be calculated from the formula

\[
\theta_{\text{he}} = \theta_0 + \theta_s + \theta_r
\]

where \( \theta_0 \) and \( \theta_r \) are obtained from the formula

\[
\theta_0 = \frac{57.3M_c}{h}
\]

\[
\theta_s = \frac{57.3M_c}{h_\beta \Delta t}
\]

Angle \( \theta_r \) is calculated in accordance with 4.1.5.1.

For floating cranes not working in seaway the angle \( \theta_r \) is assumed to be equal to zero. The angles \( \theta_0 \), \( \theta_s \), and \( \theta_r \) are taken as coincident in direction.

### 4.1.7.4 Heeling moment \( M_e \), in kN·m, is calculated for the case of zero heel of the floating crane by the formula

\[
M_e = 0.15(z_e + f_1 \sqrt{C_B B_d}) \Sigma k_i n_i A_i
\]

### 4.1.7.5 The value of factor \( f_1 \) is to be taken from Table 4.1.7.5 depending on the ratio \( B_i \sqrt{C_B B_d} \) and the angle \( \theta_e \).

#### Table 4.1.7.5

<table>
<thead>
<tr>
<th>( \sqrt{\frac{B}{C_B B_d}} )</th>
<th>( \theta_e ), deg</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>3.62</td>
<td>3.30</td>
</tr>
<tr>
<td>4.32</td>
<td>3.71</td>
</tr>
</tbody>
</table>

**Note:** Intermediate values of \( f_1 \) shall be obtained by linear interpolation.

### 4.1.7.6 In well-grounded cases, if agreed with the Register, additional weather restrictions are permitted for separate cargo handling operations. To this effect, when checking stability in compliance with 4.1.7.1, the rated wind velocity head and wave height shall be taken from Table 4.1.7.6 with regard to the prescribed restrictions.

#### Table 4.1.7.6

<table>

<td>4</td>
<td>2.0</td>
</tr>
</tbody>
</table>

### 4.1.7.7 The angle of heel of a floating crane prior to load drop \( \theta_0 \) shall be assumed as equal to the sum of angles due to load on the hook and unsymmetrical distribution of cargo on deck \( \theta_0 \), and the amplitude of roll \( \theta_r \) minus the angle of heel \( \theta_e \) due to wind effect. The recommended method of determination of the capsizing moment and angle of dynamical heel is given in 1.3.1 of Appendix 2.

### 4.1.7.8 The heeling moment \( M_e \) may be determined when the crane is anchored or moored, if specially agreed with the Register.

### 4.1.7.9 Where the crane is tested by a load exceeding the rated one, the stability of the floating crane shall be checked for the particular loading condition and it is to be demonstrated, to the satisfaction of the Register, that the floating crane’s safety against capsizing is ensured.

### 4.1.8 Stability of a floating crane during voyage.

#### 4.1.8.1 Stability of a floating crane is considered adequate in case:

1. The maximum arm of the statical stability curve is not less than 1.5 m at the angle of heel at least 15° and the limit of the positive statical stability (angle of vanishing stability) is not less than 45°;

2. Capsizing moment \( M_e \) determined with regard for rolling is not less than the heeling moment \( M_e \).

#### 4.1.8.2 Heeling moment \( M_e \), in kN·m, is to be calculated from the formula

\[
M_e = 0.6q(z_e + f_1 \sqrt{C_B B_d}) \Sigma k_i n_i A_i
\]

where \( q \) = wind velocity head, in kPa.
The recommended method of determination of capsizing moment \( M_c \) is given in 1.3.2 of Appendix 2. 

4.1.8.3 The values of factor \( f_l \) shall be obtained in compliance with 4.1.7.5 with \( \theta_0 = 0 \).

4.1.8.4 Wind velocity head \( q \) and rated wave height \( h_{3y} \) are to be taken from Table 4.1.10.2.

In case the floating crane is designed, for operation in some particular geographical area, the values \( q \) and \( h_{3y} \) may be taken for this area upon agreement with the Register.

4.1.9 Stability of a floating crane in non-working condition.

4.1.9.1 Stability of floating crane in non-working condition is considered adequate if for loading condition in compliance with 4.1.2.3, the maximum righting moment determined taking no account of rolling is at least 1.5 times greater than the heeling moment due to statical wind effect.

4.1.9.2 The heeling moment shall be found from Formula (4.1.8.2) with \( q = 1,30 \text{ kPa} \).

The recommended method of maximum righting moment determination is given in 1.3.3 of Appendix 2.

4.1.10 Stability of a floating crane during passage.

4.1.10.1 Where a floating crane is to undertake a passage through sea regions lying beyond the prescribed area of navigation, a plan of such passage shall be prepared which is subject to special consideration by the Register in each case.

4.1.10.2 Stability of a floating crane is to be checked with due regard for icing, for loading conditions stated in 4.1.2.2 taking into account the preparation arrangements specified in the passage plan (including possible complete or partial dismantling of a crane) and is considered to be adequate if the requirements of 4.1.8 for conditions of passage areas are met.

The rated wind velocity head and wave height shall be taken from Table 4.1.10.2.

<table>

4.2 PONTOONS

4.2.1 This Chapter applies to pontoons with the ratio \( B/D \geq 3 \) and the block coefficient \( C_B \geq 0.9 \).

4.2.2 Loading conditions.

4.2.2.1 Stability of a pontoon shall be checked for the following loading conditions:

.1 with full load:
.2 without load;
.3 with full load and icing.

4.2.2.2 When carrying timber cargo, the stability calculation should be made with regard to possible addition in mass of timber cargo due to water absorption as under 3.3.7.

4.2.2.3 When carrying pipes, the stability calculation should be made with regard to trapped water in the pipes as under 3.11.4.

4.2.3 Calculation of form stability.

When calculating the arms of form stability for a pontoon carrying timber cargo, the volume of timber cargo may be included in the calculation with full breadth and height and permeability of 0.25.

4.2.4 Allowance for icing.

4.2.4.1 Rates of icing shall be adopted as under 2.4.

4.2.4.2 When carrying timber cargo, rates of icing shall be adopted as under 3.3.7.

4.2.4.3 When carrying pipes, icing is determined as under 3.11.7.

4.2.5 Stability of a pontoon.

4.2.5.1 Stability of a pontoon shall be considered sufficient:

.1 if the area under the curve of statical stability up to the angle of heel \( \theta_0 \) is not less than 0.08 m.rad;
.2 if the static angle of heel due to wind heeling moment determined according to 4.2.5.2 does not exceed half the angle of immersion of the deck;
.3 if the range of stability is not less than:
\( 20^\circ \) for \( L \leq 100 \text{ m} \);
\( 15^\circ \) for \( L > 150 \text{ m} \).

For intermediate values of \( L \), the range of stability is determined by linear interpolation.

4.2.5.2 The heeling moment is calculated by the formula

\[
M_v = p_v A_v
\]

where \( p_v = \text{wind pressure equal to 0.54 kPa; } z = z_v - d/2 \) (\( z_v = \text{distance from the centre of the windage area to the base plane); } A_v = \text{windage area as under 1.4.6.}

4.3 FLOATING DOCKS

4.3.1 Stability of floating docks shall be checked for the following loading conditions:

.1 floating dock when supporting a ship;
.2 floating dock during submersion and emersion.

4.3.2 Calculation of liquid cargo effect is to be made in conformity with 1.4.7. The correction factor for the effect of free surfaces of liquid ballast shall be calculated at tank filling levels corresponding to the actual ones under loading condition in question.

4.3.3 Stability of a floating dock when supporting a ship.

4.3.3.1 Stability shall be checked of fully emersed
dock with a supported ship under conditions of maximum lifting capacity and moment of sail of the dock — ship system without icing.

4.3.3.2 Stability is considered to be adequate provided:

.1 angle of heel with dynamically applied heeling moment due to wind pressure according to 4.3.3.5 or 4.3.3.6 does not exceed the permissible heeling angle for dock cranes in non-operating condition or 4°, whichever is less;

.2 angle of heel with dynamically applied heeling moment due to wind pressure according to 4.3.4.4 does not exceed the angle at which safe operation of cranes is ensured;

.3 angle of trim with statically applied trimming moment due to crane weight with maximum load for the most unfavourable service case of their arrangement does not exceed the angle at which efficient operation of cranes is ensured or the angle of pontoon deck immersion, whichever is less.

4.3.3.3 The angle of heel of a floating dock, in deg., if it does not exceed the angle of immersion of the pontoon deck, is to be determined from the formula

$$\theta = 0.115 p_v A_v z / (\Delta h).$$

4.3.3.4 An angle of heel of floating dock, if it exceeds the angle of immersion of the pontoon deck, is determined from statical or dynamical stability curve when the dock is affected by the heeling moment, in kN·m, obtained from the formula

$$M_v = 0.001 p_v A_v z.$$  \hspace{1cm} (4.3.3.4)

4.3.3.5 Specific wind pressure is assumed to be 1700 Pa.

4.3.3.6 Specific wind pressure may be taken from Table 4.3.3.6 depending upon the prescribed geographical area of the floating dock operation according to Fig. 4.3.3.6.

To account for the increase of specific wind pressure with regard to the elevation of some top zones of windage area in the dock — ship system above the actual waterline the wind pressure values from Table 4.3.3.6 are multiplied by the relevant zone coefficients from Table 4.1.4.4.

In this case, the values of $p_v$, $A_v$, and $z$ are determined for each zone separately, the sum of their products for all height zones comprising windage area of the dock — ship system is included in Formulæ (4.3.3.3) and (4.3.3.4).

### Table 4.3.3.6

<table>
<thead>

<td>460</td>
<td>590</td>
<td>730</td>
<td>910</td>
<td>1110</td>
<td>1300</td>
</tr>
</tbody>
</table>

Fig. 4.3.3.6
4.3.3.7 With geographical service area of the floating dock prescribed, the specific wind pressure may be taken for this particular area.

4.3.3.8 With several geographical service areas of the floating dock prescribed, maximum specific wind pressure for these areas is to be taken.

4.3.3.9 The angle of trim, in deg., of the floating dock is to be obtained from the formula

\[ \psi = 57.3M_{pg}/(\Delta H). \]  

(4.3.3.9)

4.3.4 Stability of a floating dock during submersion or emersion.

4.3.4.1 Stability of a floating dock is to be checked in the process of submersion or emersion for the most unfavourable case, as regards stability, of the supported ship displacement, moment of sail of the dock — ship system and dock ballasting with the cranes not in operation, without icing.

4.3.4.2 Stability is considered to be adequate if the angle of heel with dynamically applied heeling moment due to wind pressure does not exceed the permissible heeling angle for dock cranes in non-operating condition or 4°, whichever is less.

4.3.4.3 The angle of heel of the floating dock is to be determined in conformity with 4.3.3.3 and 4.3.3.4.

4.3.4.4 Specific wind pressure is assumed to be 400 Pa.

4.3.5 The arm of windage area is to be determined according to 1.4.6.3. On agreement with the Register, in each particular case the arm of windage area \( z \) may be assumed as the elevation of the windage area centre of the dock — ship system above the supporting point of the floating dock in the system of its restraint.

4.3.6 These requirements apply to floating docks having sufficiently reliable system of restraint.

4.4 BERTH-CONNECTED SHIPS

4.4.1 The stability of a berth-connected ship is considered sufficient provided:

.1 the metacentric height complies with the requirements of Chapter 2.3 with due regard for the distribution of passengers among decks likely to occur in service;

.2 the angle of heel under dynamically applied wind heeling moment as determined from Formula (4.3.3.3) with due regard for the provisions of 4.3.3.5 — 4.3.3.8 (for the case of a berth-connected ship) does not exceed the maximum permissible value.

4.4.2 Under dynamically applied wind heeling moment, the ship stability is checked for the most unfavourable loading conditions as regards stability.

4.4.3 As the maximum permissible angle, the angle is assumed at which the freeboard deck or fender edge immerses or the middle of the bilge comes out from water, whichever is less.

These angles are determined considering the immersion or emergence of the ship when inclined to final angles of heel and the actual position of deck edge, fenders and the middle of the bilge. The maximum permissible angle is not to exceed 10°.

5 ALTERNATIVE REQUIREMENTS FOR THE STABILITY OF SHIPS OF UNRESTRICTED SERVICE

5.1 GENERAL PROVISIONS

5.1.1 Requirements of this Section are alternative to 2.1, 2.2, 2.3, 2.4.7 and cover ships of unrestricted service, namely, passenger ships, cargo ships and container ships, timber carriers, fishing vessels and special purpose ships (except for ship types close to supply vessels).

5.1.2 The requirements of this Section cover loading conditions mentioned under 1.4.8 and in Section 3 except for the conditions of 3.5.4 for the case of a fishing vessel on fishing grounds.

5.2 STATIC STABILITY CURVE

5.2.1 The static stability curve must satisfy the requirements below.

.1 the area under the righting lever curve should not be less than 0,055 metre-radians up to 30° angle of heel and not less than 0,090 metre-radians up to 40° angle of heel. Additionally, the area under the righting lever curve between the angles of heel of 30° and 40° should not be less than 0,030 metre-radians.

.2 The maximum righting arm should be at least 0,20 m at an angle of heel not less than 30°. Where reasonable, this angle may be reduced, but to not less than 25°.

.3 The angle of vanishing stability must not be less than 60°. However, it may be reduced to 50° provided

---

1 The requirements of this Section are based on the IMO Code of Intact Stability for All Types of Ships Covered by IMO Instrument.
that the maximum righting arm increases above 0.20 m by 0.01 m with the reduction by each 1°.

5.2.2 The angle of downflooding at which the static stability curve is cut short must not be less than the value given under 5.2.1.3.

5.2.3 For cargo ships carrying timber deck cargoes, the requirements of 5.2.1.1 and 5.2.1.2 concerning the static stability curve should be substituted by the following:

1. The area under the righting lever curve should not be less than 0.08 metre-radians up to 40° angle of heel.
2. The maximum value of the righting lever should be at least 0.25 m.

5.2.4 The ship is to comply with the above requirements with due regard for the correction for free surface effects in accordance with 1.4.7.

5.3 METACENTRIC HEIGHT

5.3.1 Except for timber carriers and fishing vessels, the corrected initial metacentric height should not be less than 0.15 m under any loading conditions.

5.3.2 The corrected initial metacentric height of fishing vessels should not be less than 0.35 m for single-deck vessels.

In vessels with complete superstructure or vessels of 70 m in length and over, the metacentric height may be reduced to the satisfaction of the Register, but in no case shall it be less than 0.15 m.

5.3.3 For timber carriers, the corrected metacentric height must not be less than indicated under 3.3.6.

5.4 WEATHER CRITERION

5.4.1 The stability of a ship is considered sufficient by weather criterion when it can withstand the combined effects of beam wind and rolling with reference to the figure as follows:

1. The ship is subjected to a steady wind pressure acting perpendicular to its centreline which results in a steady wind heeling lever $l_{w1}$ (Fig. 5.4.1);

2. From the resultant angle of equilibrium ($\theta_0$), the ship is assumed to roll owing to wave action to an angle of roll ($\theta_r$) to windward;

3. The ship is then subjected to a gust wind pressure which results in a gust wind heeling lever $l_{w2}$;

4. Areas $a$ and $b$ are compared that are shaded in Fig. 5.4.1.

The area $b$ is limited by the righting lever curve, a straight line corresponding to the gust wind heeling lever $l_{w2}$ and an angle of heel of 50° or the angle of heel $\theta_r$ corresponding to the second intercept between the straight line $l_{w2}$ and the righting lever curve, whichever is less.

The area $a$ is limited by the righting lever curve, straight line $l_{w2}$ and the angle of heel corresponding to the angle of roll $\theta_r$.

The stability of a ship is considered sufficient from the point of view of weather criterion if the area $b$ is equal to or greater than the area $a$.

5.4.2 The permissible angle of heel under action of steady wind ($\theta_0$) should be limited to a certain angle to the satisfaction of the Register. As a guide, 0.8 of the angle of deck edge immersion or 15°, whichever is less, is suggested.

The stability of timber carriers is not verified by this criterion.

5.4.3 The heeling lever $l_{w1}$, in m, is adopted constant for all angles of heel and is determined from the formula

$$l_{w1} = \frac{\varphi_v A z_v}{1000 g \Delta}$$

where $\varphi_v = 504$ Pa — wind pressure;

$A =$ projected lateral area of the portion of the ship and deck cargo above the waterline, in $m^2$, determined in accordance with 1.4.6;

$z_v =$ vertical distance from the centre of $A$ to the centre of the underwater lateral area or approximately to a point at one half the draught;

$\Delta =$ displacement in t;

$g =$ 9.81 $m/s^2$.

The heeling lever $l_{w2} = 1.5l_{w1}$.

5.4.4 For fishing vessels 24 m to 45 m in length, the value of wind pressure in Formula (5.4.3) is to be taken from Table 5.4.4 depending on the vertical distance $z(m)$ from the centre of the projected vertical area of the ship above waterline, to the waterline.

5.4.5 The amplitude of roll, in deg., for roundbilged ships is determined from the formula

$$\theta_{1r} = 109 X_1 X_2 \sqrt{r S}$$

where $X_1$ and $X_2 =$ factors as shown in Tables 2.1.3.1-2 and 2.1.3.1-3;

$$r = 0.73 + 0.6 (z_v - d)$$

$S =$ factor as shown in Table 5.4.5 in relation to the rolling period $T$.

5.4.6 The angle of roll $\theta_{2r}$ for a ship having bilge keels is determined in accordance with 2.1.3.2.
1.1 The present Instructions contain general provisions as to the contents of the Information. The scope of the Information may vary depending on the type, purpose, stability reserve and service area of the ship. It should be selected most carefully and agreed with the Register.

1.2 Each ship is to be provided with the Information in order to assist the master and the control authorities in maintaining adequate stability of the ship during service in compliance with the requirements of the present Rules as well as to ensure stability under circumstances more severe than those specified in the Rules.

Formal observance of the provisions contained in the Information does not relieve the master of the responsibility for the stability of the ship.

1.3 In the Information, the sequence of the material shall be as per 1.4.11.1.

1.4 The general requirements for the Information are as follows:

.1 The document shall be preceded by a table of contents. The pages shall bear numbers.

.2 The Information shall contain references to documents on the basis of which it was drawn up (see 4.1.5 and 4.3.4 of Part II "Classification").

.3 The unit system shall be uniform throughout the document, and it shall be the same as the unit system adopted for Information on Damage Trim and Stability.

.4 The coordinate system for determining mass moments, volumes, buoyancy, draughts shall be uniform throughout the Information, and it shall be the same as the coordinate system adopted for Information on Damage Trim and Stability.

.5 The Information shall include clarification of symbols used therein.

.6 The Information and the attached drawings and plans shall be translated into English.

1.5 The particulars of ship mentioned under 1.4.11.1.1 shall be as follows:

.1 ship’s name, builder’s name, year built;

.2 port of registry and registered number;

.3 type of ship (dry cargo ship, oil tanker, etc.);

.4 purpose (to be stated for what kind of cargo the ship is designed as per specification);

.5 ship’s class;

.6 service area and restrictions imposed (sea state, distance to port of refuge, seasons, geographical service areas, etc.).

For hopper dredgers and floating cranes, restrictions for both operating and voyage conditions shall be stated;

.7 main dimensions (length, breadth, depth; where the bulkhead deck does not coincide with the upper deck, the depth up to the bulkhead deck shall be stated);

.8 draughts up to summer loadline and summer timber loadline with displacement and deadweight corresponding to these loadlines;

.9 speed;

.10 availability of anti-rolling devices and their type; dimensions of bilge keels, if any;

.11 inclining test data on which the Information is based (displacement and centre-of-gravity coordinates for light-ship condition, name and serial number of the ship undergoing the inclining test, place and date of the inclining test, reference to the Register Inspectorate or another body having approved the inclining test report).

Where, in the case of a ship having excessive stability, calculation data for the light-ship condition in accordance with 1.5.7 have been adopted, this should be mentioned;

.12 a sketch showing the quantity and location of solid ballast, if any, on board;

.13 ship inertia coefficient $C$ in the formula for obtaining the roll period $\tau = CB/\sqrt{h_0}$ to be calculated on the basis of the roll period, if determined, during the inclining test;

.14 other data deemed necessary by the designer (for instance, carrying capacity of the ship, designed trim, stores endurance);

1.6 Documents mentioned under 1.4.11.1.2 shall include the stability characteristics of the ship and precise restrictions formulated on the basis of the

### 5.4.7 The angle of roll for a ship having sharp bilges should be adopted equal to 70 per cent of that determined from Formula (5.4.5).

### 5.4.8 The angle of roll for ships with anti-rolling devices should be determined without taking into account the operation of these devices.

---

$T = \frac{2CB}{\sqrt{h}}$, where $C = 0.373 + 0.023 \frac{B}{d} - 0.043 \frac{L}{100}$.
Rules and taking the features of the ship into consideration, namely:

1. list of stability criteria to be complied with in the case of the ship in question;
2. indication of criterion (criteria) limiting the ship stability, damage stability criteria included, where these appear to be limiting with regard to intact stability;
3. general remark to the effect the stability criteria of the Rules do not take eventual cargo shifting into consideration and to prevent such shifting one should be guided by the owner's documents regulating the securing and stowage of cargo;
4. specific limitations of ship loading formulated on the basis of the Rules (for instance, permissible weight, position of centre of gravity, dimensions of deck cargo, permissible quantities of fish on the deck of fishing vessels, deck areas of passenger ships to which the access of passengers is prohibited);
5. detailed instructions on consuming liquid cargoes and ship ballasting en route with indication of conditions proceeding from which the consuming procedure is to be applied (stability, trim and damage stability requirements);
6. indication of openings which are to be closed when at sea to prevent the flooding of spaces in hull, superstructures and deckhouses which are to be taken into consideration for stability calculation purposes, as well as indication of doors fitted in watertight bulkheads in passenger ships which are permitted to be left open and shall be ready for immediate closure at all times. Where necessary, a diagram of the openings should be attached;
7. restrictions for the application of anti-rolling devices and directions for the use of anti-heeling tanks and tanks for controlling initial stability;
8. instructions for the case of damage to bilge keels;
9. measures to ensure stability when, during a voyage or passage, the ship enters a region where the navigating conditions are more severe than those specified when assigning the area of navigation to the ship provided such measures are necessary;
10. directions for preserving ship stability when water is used for fire extinguishing;
11. restrictions and instructions aimed at ensuring an intact stability sufficient to satisfy the damage trim and stability requirements of the Register where these are compulsory for the ship in question;
12. directions for limiting forward and aft draughts with explanations of the reasons for such limitations;
13. other relevant instructions depending on the peculiarities of the ship and the stability requirements of the Register.

1.7 Recommendations to the master for maintaining sufficient stability, contained under 1.4.11.1.3, include information deemed useful by the designer. They should not be overburdened with well-known provisions of good seamanship.

Recommendations to the master may include, for instance, recommendations for choosing the direction of ship movement with regard to the seaway, for controlling the ship stability in service (see para 1.11), for minimum draught forward, manoeuvring directions (for instance, permissible speed with regard to heel on the turn for ships carrying containers on deck), recommendations for icing control, directions for correct application of anti-rolling devices; scale of forward and aft draught variations as a result of taking cargo on board, directions for operating of heavy derricks (if installed on board a transport vessel), for using, in the case of timber carriers, limiting curves corresponding to different permeabilities of timber deck cargo. This section shall include explanations for using the materials contained there-in.

The contents of this section shall be clearly marked off within the Information.

1.8 Information on typical loading conditions (see 1.4.11.1.4) shall include the following:
1. plan of tanks containing stores and ballast, spaces intended for crew and passengers, machinery space;
2. tables showing the distribution of stores and ballast among tanks in typical loading conditions with indication of the mass and centre of gravity coordinates of the tanks as well as of relevant moments. The number and denomination of the tanks shall be the same as those to be found in the general arrangement drawing. In the tables, tanks should be indicated for which corrections for free surface effect of liquids were made that were considered in typical loading conditions;
3. mass and centre of gravity position, adopted for calculation purposes, of mass groups, such as passengers with their luggage and crew with their luggage; mass and centre of gravity position of cargo items (machinery, vehicles, containers, etc.);
4. typical loading conditions for all the cargoes mentioned in the specification, loading conditions required by the Rules, marginal conditions of ship operation in accordance with its purpose to be encountered in practice and conditions of commencement of ballasting during the voyage for the purpose of maintaining stability.

As a rule, the stability calculation for typical loading conditions is to be made for mean draught with initial trim disregarded.

Typical loading conditions shall be presented on special forms. In one and the same form, two or more loading conditions may be entered which may differ in the quantity of stores or ballast, but would
characterize the variations of loading during the voyage.

A form shall contain:
- a description (denomination) of typical loading condition;
- a drawing showing the location of basic mass groups in the ship that are to be included in the displacement; a plan and directions for the stowage of deck cargo;
- a table for determining the ship’s mass, position of its centre of gravity and relevant mass moments with regard to coordinate planes including the mass moments and centre of gravity positions of particular mass groups and of the light ship, and where icing is concerned, taking the ice mass into consideration;
- correction for the free surface effect of liquid stores and ballast;
- the value of initial metacentric height adopted with regard for free surface effect;
- vertical mass moment of the ship or the height of the centre of gravity of the ship with regard for free surface effect where one of these parameters is used for estimating the ship stability proceeding from permissible values determined on the basis of the Rules;
- permissible value of metacentric height determined on the basis of the Rules, or permissible values of vertical mass moment, or the height of the centre of gravity determined on the basis of the Rules;
- stability criteria required for the ship in question by the Rules (weather criterion for the particular loading condition, standardized parameters of static stability curve, heel angles due to passengers crowding to one side, etc.);
- static stability curve plotted with regard for free surface effect, the flooding angle indicated (for all loading conditions, the scale of diagrams is to be the same);
- ship’s draught in way of forward and aft perpendiculars, mean draught;
- a short explanatory text characterizing the stability of a ship in a typical loading condition or containing other relevant information;

.5 a summary table of typical loading conditions including:
- denomination of the loading condition;
- displacement;
- trim parameters of the ship (forward and aft draught in way of perpendiculars, mean draught, trim);
- vertical centre of gravity, longitudinal centre of gravity and, where necessary, transverse centre of gravity of the ship;
- free surface correction value to the initial metacentric height;
- initial metacentric height with regard for the free surface correction;
- vertical mass moments or the height of the centre of gravity of the ship with regard for the free surface effect

where one of the parameters is used for the estimation of the ship stability proceeding from permissible values determined on the basis of the Rules;
- permissible values of initial metacentric height or of the vertical mass moment of the ship, or permissible height of the centre of gravity of the ship;
- standardized parameters and stability criteria (weather criterion, static stability curve parameters, angle of heel due to passengers crowding to one side or angle of heel in turn, etc.) and their permissible values;
- angle of flooding through opening considered to be open in accordance with the present Part of the Rules.

1.9 Data listed under 1.4.11.1.5 for independent estimation of the ship stability by the master should enable the latter to determine, with sufficient accuracy and without undue loss of time, whether the ship stability is in conformity with the Rules.

The present section of the Information shall include:

.1 stability check diagram containing the curves of permissible values of the vertical static mass moments of the ship (or permissible metacentric heights, or permissible heights of the centre of gravity of the ship) depending on displacement (or dead-weight, or ship draught). The diagram may be submitted in tabular form.

The diagram may contain more than one limiting curves for different conditions of ship operation (for instance, for operation without deck cargo, with timber cargo on board, with deck cargoes of timber having different permeabilities, under conditions of icing, when carrying one or two tiers of containers on deck). The limiting curve(s) should be calculated with regard for emergency stability and trim requirements where such requirements are compulsory for the ship. If necessary, the diagram should include the minimum value curve of static mass moments of the ship for which compliance with the Rules is ensured as regards the acceleration criterion. Nevertheless, the permissible moments curve should be easily readable and convenient for use;

.2 data for determining the mass and position of the centre of gravity of liquid cargoes;

.3 free surface correction values to the initial metacentric height and righting levers for liquid cargoes, in tabular form;

.4 data for determining the mass and the position of the centre of gravity of the cargo carried.

For this purpose, hold capacity curves and a plan of cargo spaces of the ship with indication of the coordinates of geometrical centres of volumes depending on the level of filling should be presented in the coordinate system adopted for the Information.

If containers are to be carried, a container stowage plan shall be presented being guided by which one could determine the mass and position of
the centre of gravity of container cargo in the particular loading condition. If timber or another cargo is to be carried on deck, a relevant stowage plan should be presented;

- a diagram (or table) of forward and aft draughts (in way of perpendiculars) plotted on a graph of displacement versus the longitudinal static mass moment of the ship. The diagram should enable the master to speedily determine the draughts in way of forward and aft perpendiculars. Alternatively, a relevant calculation procedure may be suggested and all the necessary values provided (moment to alter draught by one unit, longitudinal centre of gravity of the waterline, longitudinal centre of buoyancy depending on the draught);

- diagram (or table) correlating the draughts in way of perpendiculars with the draughts in way of draught marks and of the frame corresponding to the loadline;

- diagram (or table) to determine mean draught on the basis of displacement (displacement — draught curve);

- explanations for the master on the use of the contents of 1.9.1 to 1.9.7 for estimating, by calculations, the ship stability and determining the ship trim in loading conditions different from typical ones. The explanations are to be detailed and clear enough, formulated so as to avoid ambiguity, and a numerical example is to be provided covering, as far as possible, the greater part of the contents of this section. Calculations involved by the example shall be made using forms which contain typical loading conditions;

- blank forms on which the master could make independent calculations;

1.10 The materials under 1.9 should be supplemented by materials to enable a more precise estimation of the ship stability when a criterion or a number of criteria is complied with without any reserve being ensured.

Such additional materials shall include:

- a more detailed diagram of permissible moments than that stipulated by 1.9.1 which shall include curves for each of the criteria contained in the Rules. In the diagram, the resulting curves of permissible moments mentioned under 1.9.1 shall be marked out;

- cross curves (or tables) of stability, depending on the displacement or draught of the ship, so presented as to make the determining of the static stability curve for each loading condition as easy as possible for a user. The curves shall cover the displacement range from the light-ship condition to the deepest permissible draught and a heel angle range to enable determining the angle of vanishing stability. The scale of the curves and the intervals between displacement and heel angle values shall be so selected that the necessary degree of precision is guaranteed when plotting static stability curves. A heel angle interval shall not exceed 10°;

- data for direct calculation of weather criterion on the basis of static or dynamic stability curves (if deemed necessary by the designer);

- flooding angle curves proceeding from displacement or draught with a plan of openings considered to be open;

- other data necessary for exact determination of the limiting criterion or criteria (if deemed necessary by the designer);

- explanations on using additional materials mentioned under 1.10.1 to 1.10.5. Such explanations may be supplemented by a numerical example.

1.11 Directions for determining the ship stability in service should enable the master to determine the actual ship stability with adequate accuracy and minimal time expenditure. This section of the Information is to contain the following:

.1 conditions and procedure for making the in-service inclining test using the facilities available on board (automatic systems for measuring and control of stability and trim, equalizing tanks, calibrated tanks for measuring stability and heel by means of a load the weight of which is known, etc.);

.2 data to assess the precision of measurements during the in-service inclining test and to estimate the quality of the test as a whole;

.3 directions and materials to control initial metacentric height by measuring the roll period;

.4 explanations for the master concerning the assessment of the ship stability by means of the above procedures.

These materials should be clearly grouped in a separate section of the Information.

1.12 When non-grain bulk cargo is carried, Information on Stability shall include typical loading conditions for such cargo. The typical loading conditions shall be specified without regard either for possible shifting of cargo or for its properties being guided by the stowage rate of the cargo only.

Such typical loading conditions shall be provided with a note to the effect that when non-grain bulk cargo is carried one should be guided by the Rules for Safety of Marine Transportation of Solid Bulk Cargoes.

1.13 For floating cranes, the Information shall contain data on their stability as regards the rated criteria for various boom radii and various loads on the hook (by mass and windage area) including loading conditions in which the stability becomes unsatisfactory by any criterion (criteria).

For floating cranes whose stability in case of load drop is limited by the angle of flooding in the working condition, the Information shall contain requirements for reliable battening down of openings which are not to be permanently open during cargo-handling operations.

Because of the variety of their loading conditions,
data on the stability of floating cranes shall be presented in a simple and obvious form (for instance, in tables and diagrams characterizing the loading and stability of the floating crane in each of the loading conditions).

In the case of floating cranes with luffing booms, the following rule shall be applied: in order to reduce the influence of external forces upon the floating crane the boom shall be lowered to the lowest position (secured for sea) on completion of cargo-handling operations.

In the case of floating cranes with slewing cranes and a cargo platform on deck it is not recommended to perform cargo-handling operations when under way (e.g. carriage of loads hanging on the hook semi-submerged or raised above the water: small ships, metal structures, etc.). Where this is performed by floating cranes of any type, restrictions on the area of navigation and weather shall be specified for such a voyage in each case, and arrangements shall be made for reliable securing to the floating crane hull to prevent the boom, hanger and the hanging load from swinging. The possibility of a voyage with a load on the hook shall be confirmed by calculation and approved by the Register in each case.

1.14 For fishing vessels, other diagrams for stability checking than those mentioned under 1.9.1 may be permitted on agreement with the Register (for instance, where vessels are concerned for which a definite procedure of loading and consuming cargo exists, the ballasting diagram may be approved proceeding from the quantity of cargo and ship stores).

1.15 The Information of a tug shall include instructions to the master for the case of the ship operation in areas where water flow velocities above 1,3 m/s are observed.

DETERMINATION OF CAPSIZING MOMENT

1.1 Determination of the Capsizing Moment for Transport and Fishing Vessels

1.1.1 The capsizing moment \( M_c \) taking into account the effect of rolling can be determined using either a curve of dynamical or of statical stability. When determining the capsizing moment, the following two cases may take place:

1. a ship has normal curves of dynamical and statical stability, or the curve of statical stability is stepped and that of dynamical stability broken. In this case, the capsizing moment is determined as follows:

1.1.1 when the curve of dynamical stability is used, auxiliary point \( A \) is to be found on it first. For this purpose the amplitude of roll is plotted along the abscissa to the right of the origin of the coordinates and its related point \( A' \) is fixed on the curve of dynamical stability (Fig. 1.1.1.1.1). Then a straight line parallel to the axis of abscissae is drawn through point \( A' \) and segment \( A'A \) equal to the double amplitude of roll is laid off along it to the left of the auxiliary point \( A'(A'A = 2\theta) \).

![Fig. 1.1.1.1.1. Determination of capsizing moment using the curve of dynamical stability](image)

Point \( A \) located symmetrically to point \( A' \) is referred to below as the initial one. From the initial point \( A \) tangent \( AC \) to the curve of dynamical stability is drawn and segment \( AB \) equal to one radian (57,3°) is laid off from \( A \) on the straight line parallel to the axis of abscissae. From point \( B \) perpendicular \( BE \) is erected up to its intersection with tangent \( AC \) at point \( E \). Segment \( BE \) is equal to the capsizing moment, if the curve of dynamical stability is plotted to scale of work, and to the arm of the capsizing moment, if the curve of dynamical stability is plotted to scale of arms. In the latter case, to determine the capsizing moment \( M_c \), in kN\cdotm, the value of the segment \( BE \), in metres, shall be multiplied by corresponding displacement \( A \), in kN

\[
M_c = \Delta BE; \quad (1.1.1.1.1)
\]

1.2.1 when the curve of statical stability is used, the capsizing moment can be determined assuming the work of the capsizing and righting moments to be equal and taking into account the effect of rolling. For this purpose, the curve of statical stability is continued into the region of negative abscissae for a length equal to the amplitude of roll (Fig. 1.1.1.1.2), and such a straight line \( MK \) parallel to the axis of abscissae is chosen with which cross-hatched areas \( S_1 \) and \( S_2 \) are equal. Ordinate \( OM \) will correspond to the capsizing moment, if moments are plotted along the axis of ordinates, or to the arm of the capsizing moment, if arms of stability are plotted along this axis. In the latter case, to determine the capsizing
moment $M_e$ in kN·m, ordinate $OM$, in metres, shall be multiplied by the ship’s displacement, in kN

$$M_e = \Delta OM;$$

(1.1.1.1.2)

The curves of statical and dynamical stability are cut short at the angle of flooding. The capsizing moment is then determined by one of the methods given below:

2.1 When the curve of dynamical stability is used, the capsizing moment is determined as follows. Making use of the method specified in 1.1.1.1, position of the initial point $A$ is found (Fig. 1.1.1.2.1).

A tangent to the curve of dynamical stability is drawn from the initial point $A$, which is possible only when the angle of heel corresponding to the point of tangency is less than the angle of flooding. The capsizing moment or its arm is determined by using the tangent and same method as in the first case described above.

If it is impossible to draw the tangent, a straight line passing through the top final point $F$ of the curve of dynamical stability, corresponding to the angle of flooding, is drawn from the initial point $A$. A straight line parallel to the axis of abscissae is also drawn from the same initial point $A$ and segment $AB$ equal to $57.3^\circ$ is laid off on this straight line. From point $B$ perpendicular $BE$ is erected up to its intersection with the inclined straight line $AF$ at point $E$. Segment $BE$ is equal to the capsizing moment sought, if work is plotted along the axis of ordinates on the curve of dynamical stability or is equal to the arm of the capsizing moment, if arms of dynamical stability are plotted along the axis of ordinates. In the latter case, the capsizing moment is determined from Formula (1.1.1.1.1);

2.2 When curve of statical stability is used, the capsizing moment for the angle of flooding $\theta_r$ is determined as follows:

The curve of statical stability is continued into the region of negative abscissae to a length equal to the amplitude of roll (Fig. 1.1.1.2.2) and such a straight line $MK$ parallel to the axis of abscissae is chosen with which cross-hatched areas $S_1$ and $S_2$ are equal. Ordinate $OM$ will correspond to capsizing moment $M_e$ sought or its arm depending upon the method used for constructing the curve. In the latter case, the capsizing moment is determined from Formula (1.1.1.1.2).

1.2 Determination of Capsizing Moment for Hopper Dredgers and Hopper Barges

1.2.1 To determine the capsizing moment, a curve of dynamical stability of the ship after spoil discharge is plotted in compliance with Formula (3.8.4.7-2) of this Part of the Rules, continued partially into the region of negative angles of heeling. From point $A$ corresponding to the minimum on the curve (heeling angle $\theta_{BC1}$) a segment equal to the amplitude of roll $\theta$, is laid off to the left along the axis of abscissae (Fig. 1.2.1-1).

The amplitude of roll $\theta$, in this case is assumed to be $10^\circ$ with regard only to statical character of spoil discharge (with density of spoil in the hopper under
1.3 t/m³) and equal to 10° plus θ₀₂ (the greatest amplitude of ship’s rolling in relation to statically inclined position immediately after spoil discharging) with regard to dynamic character of spoil discharge. The corresponding point C is fixed on the curve and tangent CE is drawn from this point to the right part of the curve. From point C segment CN equal to 57.3° is laid off parallel to the axis of abscissae and a perpendicular is erected from the point N up to its intersection with the tangent at point H. Segment NH equals the arm of the capsizing moment Mₖ, in kN·m, which is determined from the formula

\[ M_k = \Delta NH. \]  

(1.2.1)

The angle of flooding θ₀ proves to be less than the angle of heel corresponding to the point E of the curve (see Fig. 1.2.1-1), the secant CF shall be drawn from the point C to the right part of the curve as shown in Fig. 1.2.1-2. In this case, the arm of the capsizing moment will be determined by segment NK. If point F on the curve (see Fig. 1.2.1-2) corresponding to the angle of flooding is below point F₁, where the curve intersects straight line CN, the stability of the ship is regarded to be unsatisfactory.

![Fig. 1.2.1-2. Determination of capsizing moment for hopper dredgers and hopper barges taking into account the angle of flooding](image)

If no curve of dynamical stability is available, the minimum capsizing moment is determined from the curve of static stability (see Fig. 1.1.1.1.2) as in 1.1.1.1, taking into account initial statical heel.

1.3 Determination of Capsizing Moment for a Floating Crane

1.3.1 Determination of capsizing moment and the angle of dynamical heel in working condition in case of load drop.

To determine the capsizing moment and the angle of dynamical heel after load drop, the curve of dynamical stability (to arm scale) is to be constructed for the loading condition under consideration, but without load on hook. In case the floating crane centre of gravity after the load drop does not coincide with the centre line, the curve is to be constructed with regard to angle of heel θ₀₂ due to unsymmetrical loading (including also unsymmetrical arrangement of cargo on deck).

A portion of the curve is to be constructed in the negative angle area. To be plotted to the left from the origin of the coordinates is the initial angle of heel θ₀₂ of the floating crane with a load on the hook, equal to the sum of the amplitude of roll θ in the working condition and the angle of statical heel θ₀ when the load is lifted minus the angle of statical heel θ₀ due to wind pressure (Fig. 1.3.1).

![Fig. 1.3.1. Determination of the capsizing moment and the angle of dynamical heel at the inclination after load drop](image)

The appropriate point C is fixed on the curve. The curve of the reduced arms is plotted to the right from the origin of the coordinates above the curve of statical stability, whose ordinates, in m, are calculated from the formula

\[ l_{d, \theta_0} = l_{d, \theta} + \Delta l_d, \]  

(1.3.1-1)

where \( \Delta l_d = \) correction taking into account damping forces to be obtained in compliance with 1.3.4 of the present Appendix.

The secant CE₁ is drawn from the point C so that the point of its intersection E₁ with the reduced arm curve lies on the same vertical line with point E, in which the straight line parallel to the secant touches the curve. From point C segment CN equal to 57.3° is laid off parallel to the axis of abscissae. From point N the perpendicular is erected up to its intersection with the secant at point H. Segment NH is equal to the arm of the capsizing moment, in kN·m, with due regard for damping to be obtained from the formula

\[ M_{\phi, \Delta} = \Delta NH. \]  

(1.3.1-2)

From point N segment NK is laid off equal to the arm of the heeling moment, in m, to be determined from the formula

\[ NK = M_{\phi, \Delta}. \]  

(1.3.1-3)

where \( M_{\phi} = \) heeling moment due to wind pressure.

Points C and K are connected by the straight line, whose point of intersection with the curve of reduced
arms determines the angle of dynamical heel $\theta_{d3}$ at
the inclination after load drop.

Stability may be checked taking no account of
damping. In this case, the curve of reduced arms is
not constructed, but the tangent is drawn from point
C to the curve of dynamical stability. The angle of
dynamical heel $\theta_{d3}$ is determined by the point of
intersection of straight line $CK$ with the curve.

### 1.3.2 Determination of capsizing moment with

The capsizing moment $M_c$ of the floating crane
under the effect of rolling and steady wind may be
determined both by the curve of dynamical stability
and the curve of statical stability, some portions of
which are constructed for negative angles.

.1 When using the curve of dynamical stability
the positions of initial point A and point $A_1$
(Fig. 1.3.2.1) are so selected that tangent $AC$ is
parallel to the tangent $A_1K$ and the difference of
angles of heel corresponding to points $A_1$ and $A$
is equal to the amplitude of roll.

![Fig. 1.3.2.1. Determination of capsizing moment of a floating crane secured for sea from the curve of dynamical stability](image)

Angle $\theta_i$, obtained therefrom corresponds to the
angle of statical heel due to limiting wind pressure,
and segment $BE$ is equal to the capsizing moment if the curve
of dynamical stability is plotted to scale of moments, and
to the arm of the capsizing moment, if the curve of
dynamical stability is plotted to scale of arms.

In the latter case, the capsizing moment, in kN·m,
is determined from the formula

$$M_c = \Delta BE. \tag{1.3.2.1}$$

.2 When the curve of statical stability is used, the
capsizing moment can be determined assuming the work
of the capsizing moment and that of the righting moment
to be equal and taking account of the effect of rolling and
statical heel due to limiting wind pressure (Fig. 1.3.2.2). For this purpose, the curve of statical stability is
continued in the region of negative angles for such a
portion that straight line $MK$ parallel to the axis of
abscessae cuts off the cross-hatched areas $S_1$ and $S_2$ equal
to each other and the difference of angles corresponding
to points $A_1$ and $A$ is equal to the amplitude of roll.

![Fig. 1.3.2.2. Determination of the capsizing moment of a floating crane secured for sea from the curve of statical stability](image)

Ordinate $OM$ will correspond to the capsizing
moment, if moments are plotted along the axis of
ordinates or to the arm of the capsizing moment, if arms
of stability are plotted along the axis of ordinates.

.3 If the curves of statical and dynamical stability
are cut short at the angle of flooding, the capsizing
moment shall be determined similarly to that stated
in 1.1.1.2 with regard to statical heel and the amplitudes of roll as specified in 1.3.2.1 and 1.3.2.2.

### 1.3.3 Determination of maximum righting moment

The maximum righting moment is determined
from the curve of statical stability (Fig. 1.3.3) for
non-working loading condition with due regard for
the free surface effect as well as the initial angle of
heel due to the boom turn in the plane of the frame
for floating cranes with slewing cranes.

![Fig. 1.3.3. Determination of maximum righting moment in non-working condition](image)

Segment $CB$ is equal to the maximum righting
moment if the curve is plotted to scale of moments, and
to the arm of the maximum righting moment $l_{max}$
if the curve is plotted to scale of arms. In the latter
case, the maximum righting moment, in kN·m, is to
be obtained from the formula

$$M_{\text{max}} = \Delta l_{\text{max}}. \tag{1.3.3}$$

### 1.3.4 Correction $\Delta l_s$, in m, taking account of
damping forces is to be calculated from the formula

$$\Delta l_s = l_s \sqrt{C_B B d (\theta_{sw}/57.3)^2 F_5} \tag{1.3.4-1}$$

where

- $B =$ breadth of the ship, in m;
- $d =$ moulded draught of the ship, in m;
- $C_B =$ block coefficient of the ship;
- $\theta_{sw} =$ double swing value counting from the angle equal to
  the initial heel at the moment of load drop, in deg.;
- $l_s =$ factor found from the formula
\[ b_s = F_0 \left( F_1 + \frac{z_x - d}{\sqrt{C_d Bd}} F_2 \right) + \frac{z_x - d}{\sqrt{C_d Bd}} F_3 + F_4 \]  

(1.3.4-2)

\[ z_x \] centre of gravity height above the base line, in m.

\[ F_0 \] is taken from Fig. 1.3.4 depending on characteristic \( F \) and ratio \( B_0/\sqrt{C_d Bd} \).

\[ F_1, F_2, F_3, F_4 \] are taken from Table 1.3.4-1 depending on the ratio \( B/\sqrt{C_d Bd} \).

\[ F_3 \] is factor obtained from Table 1.3.4-2 depending on the ratio \( (\theta_d + \theta_d')/\theta_d \).

\[ \theta_d \] = angle of deck immersion.

PART V. SUBDIVISION

1 GENERAL

1.1 APPLICATION

1.1.1 The requirements of this Part apply to ships of the following types:
.1 passenger ships;
.2 roll-on/roll-off ships having the length \( L_1 \geq 100 \) m;
.3 icebreakers having the length \( L_1 \geq 50 \) m;
.4 fishing vessels having the length \( L_1 \geq 100 \) m;
.5 special purpose ships;
.6 tugs having the length \( L_1 \geq 40 \) m;
.7 dredgers having the length \( L_1 \geq 40 \) m, hopper dredgers having the length \( L_1 \geq 60 \) m;
.8 salvage ships;
.9 lightships;
.10 oil tankers;
.11 chemical tankers;
.12 gas carriers;
.13 drilling ships;
.14 ships intended for the carriage of radioactive agents;
.15 supply vessels;
.16 ships having the ice strengthening marks \( \text{LY4, LY5, LY6, LY7, LY8 and LY9} \) in the class notation;
.17 dry cargo ships having the length \( L_1 \geq 80 \) m.

The remaining dry cargo ships are covered only by the requirements of 1.4.10;
.18 Type "A" and type "B" ships with reduced freeboard as mentioned under 4.1.2.1 and 4.1.3.3 of Load Line Rules for Sea-Going Ships;
.19 berth-connected ships;
.20 ships in service (passenger ships and bulk carriers).

1.1.2 For ships to which the present Part of the Rules is not applicable it is recommended that all measures allowed by the type and service conditions of the ship be taken to obtain the best subdivision characteristics possible.

However, if the Shipowner wishes a subdivision mark to be introduced in the class notation the ship is to satisfy all the requirements contained in this Part.

The applicability of the present Part of the Rules to novel craft is to be determined on agreement with the Register.

1.1.3 Section 4 is applicable to type "A" and type "B" ships with reduced freeboard provided compliance with 4.1 of the Load Line Rules as regards the subdivision of those ships is confirmed.

When making calculations required by Section 4, calculations as required by Sections 2 and 3 may be considered.

1.2 DEFINITIONS AND EXPLANATIONS

Definitions and explanations relating to the general terminology are to be found in General Regulations for the Supervision.

For the purpose of the present Part of the Rules the following definitions have been adopted:

A drilling ship is a ship intended for drilling operations.

The depth \( D \) is the least vertical distance measured from the top of the plate keel or from the line where the inner surface of shell plating abuts upon the bar keel, to the inner line of bulkhead deck abutting to the side. In ships having rounded gunwales, this distance is measured to the point of intersection of the continued inner surfaces of bulkhead deck steel plating and side shell plating at side, as though the gunwale were of angular design. In non-metal ships the above-said is to be referred to the outer surfaces of the deck and plating.

A hopper barge is a cargo transport ship intended only for transportation of spoil.

The subdivision length of ship \( L_s \) is the largest length of ship’s portion located below the margin line.

The ship length \( L_{ice} \) is the ship length on the waterline corresponding to the draft \( d_{ice} \).

The ship length \( L_1 \) is 96 per cent of the total length on a waterline at 85 per cent of the least moulded depth or the length from the fore side of stem to the axis of rudder stock on that waterline if that be greater.

A dredger is a ship extracting spoil by any appliances and having no spoil hopper.

Permeability of a space \( \mu \) is the ratio of the volume within that space which is assumed to be occupied by water to the total volume of that space.

An icebreaker is a ship intended for sailing in ice for the purpose of maintaining navigation in ice-obstructed waterways.

An oil tanker is a ship constructed or adapted primarily to carry oil or oil products in bulk in its cargo spaces and includes combination carriers and any chemical tanker when it is carrying a cargo or part cargo of oil in bulk.

The ship draft \( d \) is a vertical distance measured at the midpoint of the appropriate ship length from the top of the flat keel to the relevant waterline of the ship. In ships with the bar keel the draft is measured from the point of abutment of the inner surface of the shell (outer surface, for ships with non-metal shell) to the bar keel.

The ship draft \( d_{ice} \) is the ship draft corresponding to the waterline serving as the upper boundary of the ice strengthening of the hull.

\(^1\)Here and hereafter all linear dimensions are given in metres.
A compartment is an inner space limited by the ship's bottom, sides, bulkhead deck and two adjacent transverse watertight bulkheads or a peak bulkhead and an extremity.

Bulkhead deck is the uppermost deck up to which transverse watertight bulkheads are carried over the entire breadth of the ship.

In the case of flooding of a compartment or group of adjacent compartments, where a watertight deck above the bulkhead deck which, together with the shell plating and watertight bulkheads, restricts progressive flooding this deck may be adopted as relevant bulkhead deck in calculating the flooding case concerned.

A lightship is a vessel provided with powerful sources of light and other equipment to orient navigators and ensure the sea-faring safety of other ships.

The margin line in ships provided with the angular-type connection of deck is the line of intersection of the upper surface of bulkhead deck plating with the outer shell plating at side.

In ships with rounded gunwale, of a radius not greater than 4 per cent of the ship’s breadth, the margin line is the line of intersection of the extended upper surface of bulkhead deck plating and the outer shell plating at side as if it were of angular design.

For ships with unusual connection of bulkhead deck and side plating, the position of the margin line is, in each case, subject to special consideration by the Register.

The effective damage freeboard of passenger ship $F_1$ is a value equal to the projected area of the ship's above-water portion divided by $2/3L_v$. This area is to be determined for the uppermost position of the ship (with no regard to heel) between the relevant bulkhead deck up to which the watertight bulkheads bounding the area of flooding concerned are carried and damage waterline.

In so doing, account is taken of that part of the projected area only which is located $1/3L_v$ forward and aft of the midpoint of the ship length $L_v$.

In determining the value of $F_1$, no part of the projected area more than 0.2 $B_2$ above damage waterline should be included. However, where there are stairways or other openings in the bulkhead deck through which serious downflooding might occur $F_1$ should be adopted not greater than $1/3B_2 \tan \theta_1$ where $\theta_1$ is the smallest angle of heel determined with no regard to the static damage-heeling angle at which one of the relevant openings would be immersed.

A salvage ship is a ship for rendering aid to vessels in distress at sea.

A hopper dredger is a ship extracting spoil by any appliances and having a hopper for its transportation.

The ship breadth $B_1$ is the extreme moulded breadth of a ship at midlength at the level of or below the deepest subdivision loadline.

The ship breadth $B_2$ is the extreme moulded breadth of a ship at midlength at the relevant bulkhead deck.

For the purpose of this Part the following explanations have been adopted:

Damage waterline is the waterline of a damaged ship with one or more compartments flooded.

Subdivision loadline is the loadline of an undamaged ship which is used in determining the subdivision of the ship.

A fishing vessel is a vessel for catching and processing or only for catching fish and other living resources of the sea.

The lightest service draft $d_0$ is the service draft corresponding to the lightest anticipated loading and associated tankage including such ballast as may be necessary for stability and immersion.

The subdivision draft $d_s$ is the draft up to the subdivision loadline.

Factory and mother ships and processing ships are special purpose ships not engaged in catching which have equipment on board to process the catch collected from fishing vessels.

A refrigerated fish carrier is a cargo ship to collect the produce from fishing and processing vessels directly at sea.

A factory freezer is a transport ship with processing equipment on board to collect the catch from fishing vessels. Proceeding from the number of special personnel, it may be considered a special-purpose ship.

The deepest subdivision loadline is the waterline which corresponds to the deepest draft permitted by applicable subdivision requirements.

Midlength is the midpoint of the subdivision length of a ship.

Equalization of a ship is the process of eliminating or reducing heel and/or trim.

1.3 SCOPE OF SUPERVISION

1.3.1 The provisions pertaining to the procedure of classification, supervision during construction, classification surveys, as well as the requirements for the technical documentation to be submitted for consideration by the Register are contained in General Regulations for the Supervision and in Part I "Classification".

1.3.2 For every ship meeting the requirements of the present Part of the Rules, the Register shall carry out the following:
.1 checking of the compliance of the structural measures taken to ensure subdivision of the ship with the requirements specified in 1.1.6 and 2.7 of Part II "Hull", Section 7 of Part III "Equipment, Arrangements and Outfit", Sections 2, 4, 5 and Chapters 7.1 - 7.11, 10.1, 10.4, 10.6, 12.1 of Part VIII "Systems and Piping";
.2 consideration and approval of Information on Damage Stability and Trim and consideration of Information on the Effect of Flooding;
.3 checking of correct assignment and marking of additional load lines corresponding to subdivision load lines.

1.4 GENERAL TECHNICAL REQUIREMENTS

1.4.1 The ship subdivision is to be the most effective bearing in mind the service of the ship. The degree of subdivision is to vary proceeding from the area of navigation, ship length and number of persons on board so that the highest subdivision degree would be characteristic of ships of the greatest length engaged for the most part in the carriage of passengers and of those navigating in the Arctic and the Antarctic.

1.4.2 In no case shall any subdivision loadline be assigned above the highest loadline in sea water determined on the basis of the ship hull safety or in accordance with the Load Line Rules.

The subdivision loadline assigned to the ship is marked on its sides and recorded in the documents of the Register as required by Load Line Rules for Sea-Going Ships.

1.4.3 The volumes and areas should, in all cases, be calculated to moulded lines. The volumes and free surfaces of water which penetrates the compartments of reinforced-concrete, plastic, wood and composite ships should be calculated to inboard hull lines.

1.4.4 When determining the initial metacentric height of a ship in damaged condition, corrections for the effect of free surfaces of liquid cargoes, ship stores and ballast water should be taken into account in the same manner as in the case of calculating the intact stability of a ship in compliance with 1.4.7, Part IV "Stability".

When plotting static stability curves for a damaged ship, the enclosed superstructures, trunks, deckhouses, angles of flooding through openings in ship's sides, decks, hull and superstructure bulkheads considered open as well as corrections for free surfaces of liquid cargoes should be taken into account in the same manner as in the case of plotting curves for an intact ship in compliance with 1.4.9, Part IV "Stability".

Superstructures, trunks and deckhouses which sustain damage may only be taken into account with the permeability specified in 2.2.1, 2.2.3 or 2.2.4 or ignored. The openings in such structures leading to spaces which are not flooded are considered open at appropriate angles of heel only when regular watertight means of closing are not fitted.

1.4.5 When calculating damage stability and trim, account should be taken of changes in the initial ship loading (intact ship) due to liquid cargoes being replaced by sea water in damaged tanks, bearing in mind that in the flooded tanks below the damage waterline the free surface of those cargoes disappears.

1.4.6 Ships to which the present Part of the Rules is applicable should be provided with approved information on damage stability for the case of compartment flooding. This information should enable the Master, in operating the ship, to allow for the requirements concerning subdivision and to estimate the condition of the ship when compartments are flooded as well as to take measures for maintaining the damaged ship afloat.

The information should include the following:
.1 data on the ship, its longitudinal section, deck and double-bottom plans, typical cross-sections with indication of all watertight bulkheads and enclosures with openings therein, means of their closure and drives as well as diagrammatic arrangement of systems necessary for the survival of the damaged ship;
.2 information necessary to maintain the stability of an intact ship sufficient to withstand, in accordance with the requirements of the present Part of the Rules, the most dangerous extent of damage; instructions on loading and ballasting the ship, including recommendations on distributing cargo in the holds, stores and ballast in a manner reasonable as regards the subdivision adopted and satisfying at the same time the requirements for the trim, stability and strength of the ship;
.3 the diagram of the limiting gravity-centre heights of the ship (limiting moments or minimal metacentric heights) plotted bearing the requirements of this Part in mind;
.4 list of results of symmetrical and unsymmetrical flooding calculations with data on initial and damage draught, heel, trim and metacentric height both before and after taking measures for the equalization of the ship or for improving its stability as well as measures recommended for these procedures and the period of time required; parameters of static stability curves anticipated under the worst flooding conditions are also to be included;
.5 data on structural measures to ensure ship subdivision, instructions on the use of covers, cross-flooding arrangements and emergency appliances as well as on possible consequences of flooding due to the particular features of the ship and on advisable and prohibited actions of the crew under normal conditions of service and in case of damage involving flooding.
1.4.7 In the case of oil tankers, Information on Damage Stability and Trim is to additionally include:

.1 a list of basic requirements for the damage stability and trim of the ship;

.2 information to enable the Master to estimate on his own the fulfilment of the requirements of 3.5 of the present Part of the Rules for each condition of partial or full loading encountered in service;

.3 a practical example and explanations to facilitate such an estimation. The requirements of this paragraph are compulsory only when oil or oil products are carried.

1.4.8 Information on Damage Stability and Trim should be compiled on the basis of the inclining test of the ship and the data contained in the Information on Stability. The procedure of extending the validity of Information on Damage Stability and Trim from one ship to another is similar to that of extending the validity of Information on Stability specified in 1.4.11.3, Part IV "Stability".

Information on Damage Stability and Trim may be incorporated in Information on Intact Stability as a separate section.

1.4.9 Where a shipboard computer is used to estimate the damage stability and trim, such a computer with associated software is to be type-approved by the Register.

A computer is not equivalent to Information on Damage Stability and Trim.

1.4.10 Dry cargo ships of less than 80 m in length should be provided with Information on the Effect of Flooding of the Compartments. This Information should contain data and documentation listed in 1.4.6.1 and results of damage stability calculations when machinery space and every cargo space are flooded. The calculations should be made for two draughts, one of which should be the summer draught. The maximum permissible position of ship’s centre of gravity should be taken according to Information on Stability. Permeabilities of cargo spaces should be taken with regard to the cargoes intended to be carried and should be within 0.60-0.90.

The information should contain a summary table of calculation results with indication of critical factors and details given in 1.4.6.5.

1.4.11 Every ship shall have draught scales prominently marked at bow and stern. Where the draught scales are so placed that they are not clearly visible or service conditions impede reading the indications of the scale the ship should be provided with a reliable draught measurement system whereby the forward and aft draughts can be easily determined.

1.5 SATISFACTORY SUBDIVISION

1.5.1 The subdivision of a ship can be considered satisfactory as regards the present Part of the Rules if:

.1 the actual probability subdivision index $A$ is not lower than the required probability subdivision index $R$. The indices $A$ and $R$ are to be determined on the basis of Section 2;

.2 damage stability is in accordance with Section 3.

The requirement under 1.5.1.1 is not applicable to ships for which in Section 2 there are no instructions for determining the indices $A$ and $R$.

1.5.2 A subdivision distinguishing mark is introduced in the class notation of a ship in accordance with 2.2.4, Part I "Classification" provided under all design loading conditions corresponding to the type of ship concerned its subdivision is considered satisfactory according to 1.5.1 and the compliance of structural measures related to the subdivision of the ship with the requirements of 1.1.6 and 2.7, Part II "Hull"; Section 7 of Part III "Equipment, Arrangements and Outfit"; Sections 2, 4, 5 and Chapters 7.1 - 7.11, 10.1, 10.4, 10.6, 12.1 of Part VIII "Systems and Piping" is proved.

When, in accordance with 3.5 of this Part of the Rules, the number of floodable compartments is changed throughout the ship length, the lowest value is to be stated in the subdivision distinguishing mark.

1.5.3 Additional conditions under which a subdivision distinguishing mark is to be introduced in the class notation can be found in Ch. 3.5.

2 PROBABILITY ESTIMATION OF SUBDIVISION

2.1 FLOODABLE LENGTH

2.1.1 In a ship with a continuous bulkhead deck, floodable length is the maximum portion of ship length, having its centre at the point in question, after the flooding of which, with a permeability equal to 0.8, draughts corresponding to the subdivision loadline and no initial trim, the damage waterline would touch the margin line.

2.1.2 In the case of ship having a step in the bulkhead deck, the floodable length can be determined to an assumed continuous margin line which, at no portion, is higher than the upper edge of the deck to which the watertight bulkheads concerned and the shell reach out.

Besides, the sides, throughout the ship length, are to reach the deck corresponding to the upper margin
line and all the openings in the shell plating below this deck are to satisfy the requirements imposed on openings which are below the margin line.

2.1.3 In determining the floodable length, immersion of the margin line in way of flooding is permitted.

2.1.4 At any point of ship length, the floodable length should be determined by a method which takes the lines, draught and other ship particulars into consideration.

2.2 PERMEABILITY

2.2.1 For the purpose of determining the subdivision index \( A \) in compliance with 2.5, the permeability of each space is to be assumed equal to:

1. 0.85 for machinery spaces, spaces occupied by electric generating sets and by processing equipment in factory ships, fishing vessels and vessels of special purpose ships;
2. 0.6 for spaces of ships, other than passenger occupied by cargoes or stores as well as those intended for liquid cargoes and stores and for spaces of passenger occupied by stores;
3. 0.95 for spaces not generally occupied by substantial quantities of cargo and stores, spaces occupied by empty vehicles, empty containers or other cargoes of high permeability and for accommodation spaces;
4. 0.98 for empty tanks and tanks intended solely for sea-water ballasting;
5. 0.8 for the cargo spaces of ro-ro ships.

2.2.2 The permeability of a passenger ship space intended for cargo is to be assumed depending on the draft of the ship prior to damage. For each initial draft \( d_i \), the permeability \( \mu_i \) of each cargo space should be determined from the formula

\[
\mu_i = 1 - \frac{1.2(d_i - d_0)}{d_i} - 0.05\frac{(d_i - d_0)}{d_i - d_0},
\]

but it need not be taken greater than 0.95 or less than 0.6.

2.2.3 The permeability of spaces may be assumed lower than specified in 2.2 and 3.3 only in case a special calculation is made which is approved by the Register.

When performing such special calculation for cargo spaces including refrigerated ones, the permeability of net cargo should be assumed equal to 0.6, and that of the cargo in containers, trailers, roll trailers and lorries should be assumed equal to 0.71.

2.2.4 Where the arrangement of spaces or the service conditions of the ship are such that the expediency of the application of other permeabilities resulting in more severe requirements is evident, the Register is entitled to require the application of those permeabilities.

2.3 SUBDIVISION INDEX

2.3.1 The required subdivision index \( R \) should be obtained from the following formulae:
1. for passenger ships

\[
R = 1 - \frac{250}{L_s + \frac{(N/4) + 375}{N}} ; \tag{2.3.1.1}
\]

but not less than 0.51;

2. for vessels of fishery fleet (processing ships, refrigerated fish carriers and mother ships) with the length of \( L_s < 80 \text{ m} \) and for fishing vessels

\[
R = \frac{3}{2} \sqrt{1 - \left(1 - \frac{88}{L_s + \frac{(N/4) + 36}{N}}\right)^2} ; \tag{2.3.1.2}
\]

but not less than 0.5;

3. for tugs of \( L_s < 80 \text{ m} \) in length, salvage ships of \( L_s < 80 \text{ m} \) in length and lightships

\[
R = 1 - \frac{82}{L_s + \frac{(N/4) + 124}{N}} ; \tag{2.3.1.3}
\]

but not less than 0.5;

4. for icebreakers with the length of \( L_s < 80 \text{ m} \)

\[
R = 1 - \frac{70}{L_s + \frac{(N/4) + 200}{N}} ; \tag{2.3.1.4}
\]

5. for special purpose ships, other than those referred to in 2.3.1.2, the subdivision index \( R \) is determined by the Register with regard for the prescribed area of navigation, purpose of the ship and number of persons on board. In case the value of the index \( R \) be adopted less than 0.6 unless specifically provided otherwise;

6. In the formulae (2.3.1.1) - (2.3.1.4), \( N = N_1 + 2N_2 \) where \( N_1 \) is the number of persons for whom lifeboats are provided as compared to the total number of persons that are to be on board during the voyage, \( N_2 \) is the number of persons (including officers and crew) that the ship is permitted to carry in excess of \( N_1 \).

Where the service conditions are such that compliance with 1.5.1 on the basis of \( N = N_1 + 2N_2 \) is impracticable and where the Register considers the hazard reasonably low, a smaller value of \( N \) may be adopted, but in no case less than \( N_1 + N_2 \).

For non-passenger ships, \( N \) is assumed to be equal to the number of persons, including officers and crew, whose carriage is permitted.

As far as ships mentioned under 3.5.2.2 are concerned, the number of passengers is adopted equal to

\[
12 + 0.042 \Sigma S
\]

where \( \Sigma S \) is the total area, in \( \text{m}^2 \), of the decks of cargo spaces in which vehicles can be carried and which are not less than \( 4 \text{ m} \) high.
2.3.2 The probability index $A$ is determined from the formula
\[ A = \sum a \cdot p \cdot c \cdot s. \] (2.3.2)

To be summed up are the numbers of all compartments and groups of adjacent compartments.
The values $a$, $p$, $c$ and $s$ should be determined in compliance with 2.4 and 2.5.

2.4 COMPARTMENT FLOODING PROBABILITY

2.4.1 The probability $p$ of a compartment (group of adjacent compartments) being flooded depends on the position of the compartment as part of the ship length and the length of the compartment in question.

In formula (2.3.2), the value $a$ accounts for the effect of the position of a compartment as part of the ship length on the probability with regard for the law of absissae distribution in the middle of the longitudinal extent of damage, $p$ accounts for the effect of compartment length with regard for the law of distribution of the longitudinal extent of damage.

2.4.2 The value $a$ is determined for each compartment or a group of adjacent compartments by the following formula:
\[ a = 0.4 \left[ 1 + \xi_1 + \xi_2 + \xi_{12} \right] \] (2.4.2)

where \[ \xi_1 = x_i/L_o, \text{ if } x_i \leq 0.5L_o; \]
\[ \xi_2 = x_i/L_o, \text{ if } x_i > 0.5L_o; \]
\[ \xi_1 = 0.5, \text{ if } x_i > 0.5L_o; \]
\[ \xi_2 = (x_i + x_j)/L_o, \text{ if } x_i > 0.5L_o; \]
\[ \xi_{12} = 1.0, \text{ if } x_i + x_j > L_o; \]
\[ x_i \text{ is the distance from the aft terminal of ship's hull at or below the bulkhead deck to the aft end of the considered compartment or group of adjacent compartments;} \]
\[ x_j \text{ is the distance from the aft terminal of ship's hull to the forward end of the considered compartment or group of adjacent compartments.} \]

2.4.3 For the purposes of 2.4.2 and 2.4.4 the length of any compartment or group of adjacent compartments under consideration bounded by one or two bulkheads-having steps is taken equal to the distance between transverse planes passing through the portions of these bulkheads which are nearest to each other. Distances $x_i$ and $x_j$ are measured to these transverse planes, respectively.

Steps formed by watertight floors in the double bottom need not be taken into account.

2.4.4 The value $p$ shall be determined for compartments taken singly from Formulae (2.4.5) and (2.4.6).

To evaluate the $p$ values attributable to groups of adjacent compartments, the following formulae apply:
for compartments taken by pairs
\[ p = p_{ij} - p_i - p_j \] (2.4.4-1)
for compartments taken by groups of three
\[ p = p_{ijk} - p_i - p_j - p_k + p_{ijk} \] (2.4.4-2)
for compartments taken by groups of four
\[ p = p_{ijkl} - p_{ijk} - p_{iklm} + p_{ijkl} \] (2.4.4-3)

In the above formulae:
\[ p_i, p_j \text{ are determined for compartments of the length } l_i \text{ and } l_j; \]
\[ p_{ik}, p_{iklm} \text{ are determined for compartments of the lengths } l_{ik} = l_i + l_j \text{ and } l_{iklm} = l_i + l_j + l_m \text{ respectively; } \]
\[ p_{ijk}, p_{ijkl} \text{ is determined for compartment of the length } l_{ijk} = l_i + l_j + l_m \text{ respectively.} \]

For stepped bulkheads, the compartment length for calculation purposes should be determined in accordance with Fig. 2.4.4.

![Fig. 2.4.4 Diagram for determining lengths of compartments for calculation purposes](image)

2.4.5 For all ships mentioned in 2.3.1 except those mentioned in 2.3.1.2, $p$ is to be determined with regard for 2.4.4 and from the following formulae:
\[ p = k_1 \left[ 4.46(l/k_e L_o)^2 - 6.20(l/k_o L_o)^3 \right] \]
if \[ l/k_e L_o \leq 0.24; \]
\[ p = k_1 \left[ 1.072 \frac{l}{k_o L_o} - 0.086 - \frac{1 - k_2}{13} \left( \frac{l}{k_o L_o} - 0.24 \right) \right] \]
if \[ l/k_o L_o > 0.24; \]
with \[ L_o > 200 \text{ m} \] (2.4.5)
\[ p = k_1 \frac{W}{4.46(l/200 k_e)^2 - 6.20(l/200 k_o)^3} \]
if \[ l/k_e \leq 48; \]
\[ p = k_1 \frac{W}{1.072 \frac{l}{200 k_o} - 0.086 - \frac{1 - k_2}{13} \left( \frac{l}{200 k_o} - 0.24 \right)} \]
if \[ l/k_o > 48; \]
\[ W = 184/(L_o - 16) \]
where \( i \) is the length of the compartment or group of adjacent compartments, in m (see 2.4.3);
\( k_i \) is a factor taking account of the effect of ship’s speed on the longitudinal extent of damage, equal to 1.0 for passenger ships and for all others:
\[ k_i = 0.6(1 + V/V_14) \quad \text{with} \quad V \leq 21 \text{ knots} \]
\[ k_i = 1.0 \quad \text{with} \quad V > 21 \text{ knots} \]
\( V \) is the specification speed of a ship, knots.

2.4.6 For fishing vessels, processing ships, taking-over-and-transport ships and fishing mother ships, \( p \) is to be determined with regard for 2.4.4 and from the following formulae:

\[ p = \frac{k_k}{L_s} \left[ \frac{1}{6.21} \left( \frac{l}{k_k L_s} \right)^2 - \frac{1}{95.5} \left( \frac{l}{k_k L_s} \right)^3 \right] \]
if \( l/k_k L_s \leq 4.7; \)

\[ p = \frac{k_k}{L_s} \left[ \frac{1}{1.5} \left( \frac{l}{k_k L_s} \right) + \frac{1}{53.8} \left( \frac{l}{k_k L_s} \right)^2 - \frac{1}{3100} \left( \frac{l}{k_k L_s} \right)^3 \right]
- 1.04 \]
if \( 4.7 < l/k_k L_s < 19.2; \)

\[ p = (k_k L_s) [1.024(l/k_k L_s) - 3.33] \]
if \( l/k_k L_s \geq 19.2 \)

where \( k_k \) is the factor taking into account the effect of displacement on the longitudinal extent of damage equal to \( k_k = L_s/160 + 0.5; \)
for \( k_{ic} \) see 2.4.5.

2.5 PROBABILITY OF SHIP’S SURVIVAL AFTER DAMAGE OF A COMPARTMENT OR A GROUP OF ADJACENT COMPARTMENTS

2.5.1 The value \( cs \) in Formula (2.3.2) is a relative measure of the probability of ship’s survival after a damage of a compartment (a group of adjacent compartments) under consideration.

The factor \( c \) evaluates the conditional effect of damage stability on the said probability. The factor \( s \) allows for draught distribution law, combined distribution law of draught and permeability for cargo holds.

2.5.2 The factor \( c \) for all ships, except for passenger ships, is assumed as equal to 1.0 for compartments (groups of compartments) after flooding of which the requirements of Section 3 for damage stability are met, and to 0.7, if the requirements of Section 3 are not fulfilled.

For passenger ships \( c \) is assumed to be equal to 1.0.

The requirements of 3.2.1 are not applicable when \( c \) is determined.

2.5.3 The value of \( s \) shall be determined for each individual compartment (group of adjacent compartments) by Formulae (2.5.4) to (2.5.8) and provisions of 2.5.9. The following symbols are assumed in the formulae:

\( \theta \) is a statical angle of heel after flooding of the considered compartment;
\( h_d \) is the initial damage metacentric height determined by the constant displacement method;
\( l_s \) is the length of a compartment or a group of adjacent compartments. Where the bulkheads bounding the considered compartment or group of compartments are stepped or recessed, \( l_s \) is to be assumed as equal to the distance between the appropriate equivalent plane bulkheads;
\( l_f \) is the floodable length determined at the point corresponding to the midlength \( L \), at \( \mu = 0.8; \)
\( \mu \) is permeability of a compartment or compartments as defined in 2.2;
\( DW \) is the ship’s deadweight at the subdivision draught (the mass of ballast water is not included in the deadweight);
\( A \) is the ship’s displacement at the subdivision draught;
\( k = (DW - DW_0)/A; \)
\( DW_0 \) is the specification deadweight of a refrigerated fish carrier on departure (the mass of ballast water is not included in the deadweight).

2.5.4 For passenger ships the value \( s \) shall be obtained from the following formula:

\[ s = 0.45s_1 + 0.33s_2 + 0.22s_3 \quad (2.5.4-1) \]

where \( s_1, s_2, s_3 \) are determined at the initial draughts prior to flooding \( d_t, d_s \) and \( d_h \) from the formulae:

\[ s_j = 4.9\sqrt{(F_t B_1 - 165.2)/W_d} \quad (2.5.4-2) \]

\( s_j \) is not taken as greater than 1.0, and in case of negative value of any of the factors of the term under the root sign, it is taken as zero.

For the design value of \( s_j \), the minimum value of \( s_j \) is to be taken as determined for the most unfavourable conditions of flooding of the considered compartment or a group of adjacent compartments at draught \( d_f \).

Values \( F_t, \theta \) and \( h_d \) shall be obtained at initial draught \( d_f \) for the final stage of flooding after operation of cross-flooding arrangements with the vertical centre of gravity at which the requirements for damage stability are still fulfilled. Where in any case of service at the draught \( d_f \), the vertical centre of gravity is lesser than the permissible one, the maximum value of all those possible in service is to be used in calculations.

The value \( s_j \) shall be taken as zero for any case of flooding which results:

during intermediate flooding or prior to equalization, in an angle of heel in excess of 20 deg. or which immerse any openings through which down-flooding might take place, or

for the final stage of flooding, except in way of the flooded compartment or compartments, in
immersion of the relevant bulkhead deck, or heel in excess of 12 deg. or $h_p$ less than 0.05 m.

Draughts $d_i$ shall be determined from the following formulae:

$$d_1 = d_s - \frac{2}{3} (d_s - d_0);$$

$$d_2 = d_s - \frac{1}{3} (d_s - d_0);$$

$$d_3 = d_s - \frac{1}{6} (d_s - d_0).$$

(2.5.4-3)

2.5.5 For fishing vessels, processing ships, taking-over-and-transport ships, fishing mother ships and special purpose ships with dry cargo holds, $s$ should be determined from the formula

$$s = s_c + s_m(1 - e/0.85)$$  \hspace{1cm} (2.5.5)

where $e$ is the relation of volume of cargo spaces (moulded) in the considered compartment or a group of adjacent compartments to the total volume of the compartment or a group of compartments below the bulkhead deck. The cargo spaces having the design permeability equal to 0.95 (see 2.2.1.3) shall not be included in the volume of cargo spaces. If the value $e$ exceeds 0.85, it should be assumed equal to 0.85;

$s_c$ is a value to be determined from the below formulae for compartments or groups of compartments below the deck in case the value $e$ is equal to or less than 0.85;

$s_m$ is a value to be determined from the below formulae for compartments or groups of compartments in case the value $e$ exceeds 1.0.

If the values $s$, $s_c$, or $s_m$ exceed 1.0, they shall be taken as equal to 1.0. In case the values $s$, $s_c$, or $s_m$ are less than zero, they shall be taken as equal to zero.

2.5.6 The values of $s_c$ and $s_m$ for special purpose ships having holds for dry cargoes should be determined from the formulae:

$$s_c = (0.6 + DW/A) \left[ \frac{1.68D/d_s - 0.478(D/d_s)^2 - 1.02}{1.68D/d_s - 0.478(D/d_s)^2 - 1.02} \right] (0.7DW/A + 0.18) + (0.8 - \mu_l/(0.8l)) (D/d_s - 1.05);$$

$$s_m = \frac{0.6DW/A + (1 - \mu_l/(0.8l))(D/d_s - 1)}{0.6DW/A}$$

(2.5.6-1)

2.5.7 For mother ships, processing ships, fishing vessels and refrigerated fish carriers, the values of $s_c$ and $s_m$ should be determined from the formulae:

for fishing vessels with refrigerated holds

$$s_c = \frac{DW/A - 0.4}{(D/d_s - 0.1)^2} + (1.12 + L_s/266) \left[ (4.75L_s + 48) + (0.5 - \mu_l/(0.8l))(26.8L_s - 0.192L_s^2 - 401)D/d_s + (0.358L_s^2 - 44.5L_s + 995) \right] / (4.75L_s + 48);$$

$$s_m = \left[ \frac{3}{(L_s - 6)/50 + 0.3DW/A - 1} \right] \left[ (0.003L_s + 0.375)DW/A + (1 - \mu_l/(0.8l)) \times (D/d_s - 1)125(L_s + 30) \right] / (0.003L_s + 0.375)DW/A;$$

(2.5.7-2)

for fishing vessels with non-refrigerated holds

$$s_c = [11.75D/d_s - 4.38(D/d_s)^2 - 6.0] \left[ \frac{0.43D/d_s - 0.255}{0.43D/d_s - 0.255} \right] \sqrt{DW/A} + (0.56 - \mu_l/(0.8l)) (D/d_s - 1);$$

$$s_m = 1.32 \left[ 0.6DW/A + (1 - \mu_l/(0.8l)) (D/d_s - 0.98) \right] ;$$

(2.5.7-3)

(2.5.7-4)

for mother and processing ships

$$s_c = \left[ (D/d_s)^2(2.07 - 2.91DW/A) + D/d_s(9.23DW/A - 7.14) - 6.63DW/A + 6.87 \right] \times \left[ \frac{0.55D/d_s - 0.255}{0.55D/d_s - 0.255} \right] \sqrt{DW/A} + (0.8 - \mu_l/(0.8l)) (D/d_s - 1.0);$$

(2.5.7-5)

$$s_m = 1.32 \left[ 0.6DW/A + (1 - \mu_l/(0.8l)) (D/d_s - 0.98) \right] ;$$
\[s_m = 1.13 \left[ \frac{0.45 DW/A + (1 - \mu_l/0.8l_D)(D/d_s - 1)}{0.45 DW/A} \right]; \tag{2.5.7-6}\]

for factory freezers

\[s_c = (DW/A + 0.65)[2.16(D/d_s)^2 - 7.97D/d_s + 8.55] \frac{0.728 \sqrt{DW/A} + (0.7 - \mu_l/0.8l_D)(0.467D/d_s - 0.158)}{0.728 \sqrt{DW/A}} \tag{2.5.7-7}\]

\[s_m = 1.4 \left[ \frac{0.75 DW/A + (1 - \mu_l/0.8l_D)(D/d_s - 1.03)}{0.75 DW/A} \right]; \tag{2.5.7-8}\]

for refrigerated fish carriers

\[s_c = [1.02(D/d_s)^2 - 3.73D/d_s + 3.71][1 + (k - 0.25)[2.56(D/d_s)^2 - 9.68D/d_s + 9.29]]^{1/2}(2.6 - \mu_l/0.8l_D)^2 \tag{2.5.7-9}\]

at \(\mu_l/0.8l_D < 2.6\), \(s_c = 0\) at \(\mu_l/0.8l_D \geq 2.6\);

\[s_m = 0.89 \left( \frac{(1.85 - 0.375D/d_s^2)k + (1 - \mu_l/0.8l_D)(D/d_s - 1)}{(1.85 - 0.375D/d_s^2)k} \right); \tag{2.5.7-10}\]

\[2.5.8\] The value \(s\) for tugs, icebreakers, salvage ships and lightships shall be determined from the following formula

\[s = \frac{0.8DW/A + (1 - \mu_l/0.8l_D)(D/d_s - 1)}{0.8DW/A}. \tag{2.5.8}\]

Where the value \(s\) exceeds 1.0, it shall be taken as equal to 1.0. Where the value \(s\) is less than zero, it shall be taken equal to zero.

\[2.5.9\] For special-purpose ships, the formulae for determining \(s\) are to be chosen, on agreement with the Register, out of Formulae (2.5.5) — (2.5.8) with regard for the structural features and anticipated service of the ship.

\[2.6\] SPECIAL REQUIREMENTS FOR SUBDIVISION

\[2.6.1\] In ships of 100 m in length and over for compartments flooded in case of damage with the collision bulkhead included, the longitudinal extent of which is stated in 3.2.2, the \(s\) value shall be not less than 1.

\[2.6.2\] A main transverse bulkhead may be recessed provided that all parts of the recess lie inboard of vertical surfaces situated at a distance from the shell plating equal to \(1/5\) of the breadth of the ship \(B_1\) and measured at a right angle to the centre line at the level of the subdivision loadline.

Any part of a recess which lies outside these limits shall be regarded in calculations as a step.

\[2.6.3\] The calculation scheme of calculating subdivision index \(A\) given in 2.4 and 2.5 is predicated upon the condition that transverse bulkheads extend from side to side. However, a combination of transverse and longitudinal watertight bulkheads may be accepted, wherein some of the transverse watertight bulkheads extend inboard only to longitudinal watertight bulkheads, provided that:

- the subdivision index \(A\), calculated with regard to 2.6.4 is not less than the required subdivision index \(R\);
- watertight floors in the double bottom are in line with watertight transverse bulkheads in the wings or the double bottom is subdivided by other equivalent means;
- in passenger ships the inner bottom plating between the longitudinal bulkheads is located not less than 0.1\(B_1\) above the base line.

\[2.6.4\] For the purpose of subdivision of the ship by longitudinal watertight bulkheads the values \(a, p, c\) and \(s\) shall be determined as follows:

- \(1\) the value \(a\) shall be determined in compliance with 2.4.2; the values of \(x\) being taken as distances from the aft terminal to the transverse bulkheads bounding the considered wing compartment or group of adjacent compartments;

- \(2\) the value \(p\) calculated as in 2.4.5 and 2.4.6 is multiplied by the reduction factor \(r\) which represents the probability that a longitudinal bulkhead will remain intact in case of damage (see Appendix).

The value \(r\) shall be obtained from the following formulae:

\[r = \frac{b_1}{k_c B_1} \left[ 2.8 + \frac{0.08}{T_k L_s + 0.02} \right] \tag{2.6.4.2}\]

if \(b_1/k_c B_1 \leq 0.2\), and
\[ r = \frac{b_1}{k_e B_1} + 0.36 + \frac{0.016}{l/k_e L_s} + 0.02 \]

if \( b_1/k_e B_1 > 0.2 \)

where

- \( l \) = the distance between the transverse bulkheads bounding the considered wing compartment or group of compartments (the same value \( l \) is used in calculating \( p \));
- \( b_1 = 1.4b \) for processing ships, fishing vessels refrigerated fish carriers and mother ships;
- \( b = b \) — for ships of other types;
- \( b \) = the mean transverse distance measured at right angles to the centre line between the shell plating (at the subdivision loadline) and the nearest portion of the longitudinal watertight bulkhead (see Figure 2.6.4.2).

\[ \begin{align*}
\frac{l}{2} & \quad \frac{b}{2} \\
\ell_i + \ell_j & = 2
\end{align*} \]

Fig. 2.6.4.2

Determining the design value \( b \):

1 — longitudinal bulkhead;
2 — side

Where \( l/k_e L_s < 0.2 b_1/k_e B_1 \) the value \( r \) shall be determined by linear interpolation assuming that with \( l/k_e L_s = 0 \) \( r = 1.0 \) and with \( l/k_e L_s = 0.2 b_1/k_e B_1 \) \( r \) is equal to the value determined by Formulae (2.6.4.2); the values \( c \) and \( s \) for passenger ships shall be obtained in compliance with 2.5.2 and 2.5.4.

For non-passenger ships these values shall be based on the following.

Where in case of flooding of a wing compartment or a group of wing adjacent compartments the damage stability requirements of Section 3 are met for all loading conditions of a ship, the value \( cs \) for these compartments is taken equal to a unit.

Where after flooding of wing compartments the requirements of Section 3 are fulfilled not for all loading conditions, the least possible in service ratio of voyage time during which the requirements of Section 3 are met to the duration of the whole voyage may be assumed as the \( cs \) value (in this case, account may be taken of the relative time when the considered wing compartment or compartments are filled with liquids).

In this case, by voyage duration is meant the time of consuming 90 per cent of full stores.

2.6.5 Where actual subdivision index \( A \) calculated as in 2.6.4 is less than the required subdivision index \( R \), additional cases of combined flooding of wing compartments and a space between longitudinal bulkheads may be taken into account. In so doing, the value \( a \) shall be determined in compliance with 2.6.4.1, the value \( p \) shall be multiplied by \( 1 - r \).

The value \( cs \) shall be taken as the lesser of the values \( cs \) obtained in compliance with 2.5 and that calculated as in 2.6.4.3 for case of combined flooding of the wing and centre compartments (in both cases, the permeability of non-flooded compartments on the undamaged side shall be taken equal to zero).

2.7 PROBABILISTIC ESTIMATION OF SUBDIVISION IN SHIPS WITH THE ICE MARKS \( \text{LY4, LY5, LY6, LY7, LY8} \) \( \text{AND LY9} \) IN THE CLASS NOTATION

2.7.1 General.

2.7.1.1 The requirements of this Chapter apply to ship types listed below:
- .1 passenger ships;
- .2 dry cargo ships;
- .3 ro-ro ships;
- .4 fishing vessels and refrigerated fish carriers (except for ships with the \( \text{LY4} \) mark in the class notation);
- .5 special purpose ships;
- .6 drilling ships.

Extending the requirements of this Chapter to ships of other types will be specially considered by the Register in each case.

2.7.1.2 The subdivision will be considered satisfactory from the point of view of this Chapter if the following is observed within the range of drafts up to the waterline from which the upper border of ice strengthening is assigned:
- .1 the actual subdivision index \( A_{ice} \) determined in accordance with 2.7.2.3 is not lower than the required ice subdivision index \( R_{ice} \) determined in accordance with 2.7.2.2;
- .2 damage stability is in accordance with Section 3 in the case of ice damage mentioned under 3.5.10.4.
2.7.1.3 For ships satisfactory from the point of view of Section 3, provided the ice damage is located anywhere in the area mentioned under 3.5.10.4.4, it is not necessary to check whether the condition $A_{icw} > R_{icw}$ is observed.

2.7.1.4 No specific damage stability calculations may be performed if, by complying with the requirements of 1.5.1.2, the requirements of 2.7.1.2.2 are satisfied simultaneously.

2.7.2 Probability, estimation of subdivision in case of ice damage.

2.7.2.1 Floodable length should be determined for the draft $d_{icw}$ bearing the requirements of 2.1 in mind. The permeabilities should be determined in conformity with 2.2.

2.7.2.2 The required ice subdivision index is to be obtained from the formulae:

1. for all ship types except fishing vessels, refrigerated fish carriers and special purpose ships,

$$R_{icw} = 5 \sqrt{R};$$

(2.7.2.2.1)

2. for fishing vessels, refrigerated fish carriers and special purpose ships,

$$R_{icw} = 4 \sqrt{R}$$

(2.7.2.2.2)

where $R$ is the required subdivision index to be determined in accordance with 2.3.1 the words *with no regard to restrictions on $L_c$.*

For dry cargo ships and ro-ro ships, $R$ is to be obtained from the formula

$$R = 1 - \frac{110}{L_c + N/4 + 2T5}$$

but not less than 0.6.

2.7.2.3 The probability ice subdivision index $A_{icw}$ is to be obtained from the formulae:

1. where horizontal watertight structures are not present or may be disregarded,

$$A_{icw} = \Sigma W_{cs};$$

(2.7.2.3.1)

2. where horizontal watertight structures are to be taken into account,

$$A_{icw} = \Sigma W_{icw,cs};$$

(2.7.2.3.2)

Summing-up is to be effected on the basis of the numbers of all the compartments and groups of adjacent compartments.

The values $w$, $r_{icw}$, $c$ and $s$ should be determined in accordance with 2.7.2.4 to 2.7.2.9.

2.7.2.4 In the case of ice damage, the probability of a compartment being flooded, bounded by transverse bulkheads, is to be obtained from the formulae:

$$w = 0.57(F(x/L_{icw}) \cdot (F(x/L_{icw}) + 0.43a_{icw}p_{icw})$$

(2.7.2.4)

where $F(x/L_{icw}) = 0.196(x/L_{icw} + 0.5),$

if $x/L_{icw} \leq 0.092$;

$$F(x/L_{icw}) = 0.975(x/L_{icw})^2 - 0.975/L_{icw} + 0.1515$$

if $0.092 < x/L_{icw} < 0.3$;

$$F(x/L_{icw}) = 2.848 \times (x/L_{icw}) - 0.42, \text{ if } x/L_{icw} \geq 0.3$$

$$a_{icw} = [F(x/L_{icw}) - F(x/L_{icw})]L_{icw}(x_l - x_l);$$

$$p_{icw} = 35(L_{icw})^2 + 0.2555(L_{icw}) \text{ if } L_{icw} > 0.08,$$

$$p_{icw} = 1.03(L_{icw}) - 0.03, \text{ if } L_{icw} < 0.08$$

where $x_l$ is the distance from the middle of the length of $L_{icw}$ to the aft bulkhead of the compartment or group of adjacent compartments in question;

$x_r$ is the distance from the middle of the length of $L_{icw}$ to the forward bulkhead of the compartment or group of adjacent compartments in question;

$l$ is the compartment length in $m$ (see 2.4.3).

Values of $x$ are positive where the bulkhead is located forward of the middle and negative where it is located aft of the middle of $L_{icw}$.

The extreme points by which the length of peak compartments is determined, when calculating $w$, are to be chosen on perpendiculars plotted through the extreme points of the length $L_{icw}$.

2.7.2.5 When acting in conformity with 2.7.2.4, the provisions of 2.4.3 should be borne in mind as regards considering the bulkhead steps where these are by less than 1.2 of the draft $d_{icw}$ above the base plane.

2.7.2.6 For two adjacent compartments, $w$ should be obtained from the formula

$$w = w_i - w_j - w_j$$

(2.7.2.6)

where $w_i$ and $w_j$ are to be obtained from formulae 2.7.2.4 for single compartments with the length $l_i$ and $l_j$ and $w_k$ is to be obtained for compartments with the total length $l_k = l_i + l_j$.

2.7.2.7 With watertight double sides, an inner bulkhead is considered tight in case of ice damage if, by any of its points, it is at least 0.76 m away from the shell as measured along the normal.

2.7.2.8 With horizontal watertight platforms, the probabilities $r_{icw}$ are to be determined from the formulae below proceeding from the location of the space being flooded:

1. above the platform

$$r_{icw} = 1 - F(z/d_{icw});$$

(2.7.2.8.1)

2. below the platform

$$r_{icw} = F(z/d_{icw});$$

(2.7.2.8.2)

3. both above and below the platform

$$r_{icw} = F(z/d_{icw}) - F(z/d_{icw})$$

(2.7.2.8.3)

where $F(z/d_{icw}) = z/d_{icw} \text{ if } z/d_{icw} \leq 0.3$;

$$F(z/d_{icw}) = 0.65/d_{icw} + 0.42 \text{ if } 0.3 < z/d_{icw} < 0.97;$$

$$F(z/d_{icw}) = 1 - \frac{z/d_{icw}}{0.97} \text{ if } z/d_{icw} \geq 0.97;$$

$$F(z/d_{icw}) = 1 - \frac{z/d_{icw}}{0.97} \text{ if } z/d_{icw} \geq 0.3;$$

$$F(z/d_{icw}) = 1 - 0.69(z/d_{icw})^2 - 0.1 \text{ if } 0.3 < z/d_{icw} < 1.25;$$

$$F(z/d_{icw}) = 1.0 \text{ if } z/d_{icw} \geq 1.25;$$

where $z$ is the height of the horizontal watertight structure above the base plane.

2.7.2.9 For dry cargo ships, the values of $c$ and $s$ are to be determined from 2.5.2, 2.5.5 and 2.5.6; for
other ship types they should be obtained from relevant formulae under 2.5.

$d_i$ is to be substituted by $d_{ice}$. The values of $DW$, $If$, $A$ should be determined for the draft $d_{ice}$.

### 2.8 Probabilistic Estimation of Subdivision in Cargo Ships

#### 2.8.1 General

The probability estimation of ship subdivision stipulated by this Chapter is to be applied to cargo ships (other than ships referred to in 1.1.1.1.4, 1.1.1.5, 1.1.1.10, 1.1.1.15, 1.1.1.18 and 3.5.2.2) with the length of $L_s \geq 80$ m. The requirements of this Chapter, however, apply to ships with the length of $80$ m $\leq L_s < 100$ m, whose keel was laid on or after 1 July 1998.

For the purpose of this Chapter length $L_s$ is to be determined at the level of or below the deck or decks limiting the maximum vertical extent of flooding $H_{max}$ (see 2.8.11) with the ship’s draught corresponding to the deepest subdivision load line.

#### 2.8.2 The Required Subdivision Index is to be obtained from the following formulae:

1. For ships with the length of $L_s \geq 100$ m:
   
   $$R_{100} = (0.002 + 0.0009L_s)\frac{1}{3}$$

2. For ships with the length of $80$ m $\leq L_s < 100$ m:
   
   $$R_{80} = 1 - \left[1 - 0.01L_s \times R_{100}(1 - R_{100})\right]$$

#### 2.8.3 The Probability Index $A$ is to be obtained from the formula

$$A = \sum_i p_is_i$$

where $p_i$ is a parameter accounting for the probability that only the compartment or group of adjacent compartments under consideration may be flooded, disregarding any horizontal subdivision,

$s_i$ is a parameter accounting for the probability of survival after flooding the compartment or group of adjacent compartments under consideration, including the effects of any horizontal subdivision.

$i$ is the index of each compartment or group of adjacent compartments under consideration.

The calculations should be made for even-keel trim.

The summation should be taken over the ship’s length for all cases of flooding in which a single compartment or two or more adjacent compartments are involved.

Wherever wing compartments are fitted, contribution to the summation indicated by Formula (2.8.3) should be taken for all cases of flooding in which wing compartments are involved; and additionally, for all cases of simultaneous flooding of wing compartment(s) and adjacent inboard compart-

#### 2.8.4 The Factor $p_i$ is determined for each single compartment:

1. Where the compartment considered extends over the entire ship length $L_s$: $p_i = 1$
2. Where the aft limit of the compartment considered coincides with the forward terminal: $p_i = F/0.5ap + q$
3. Where the forward limit of the compartment considered coincides with the forward terminal: $p_i = 1 - F/0.5ap$
4. When both ends of the compartment are inside the aft and forward terminals of the ship length $L_s$ $p_i = ap$.

#### 2.8.5 The Values in 2.8.4.2 to 2.8.4.4 should be obtained from the formulae:

$$a = 1.2 + 0.8E, \text{ but not more than } 1.2;$$

$$F = 0.4 + 0.25E(1.2 + a);$$

$$p = J_{max}F_1;$$

$$q = 0.4(J_{max})^2F_2$$

where

$$E = E_1 + E_2 - 1;$$

$$E_1 = x_1/L_s;$$

$$E_2 = x_2/L_s;$$

$x_1$ and $x_2$ should be adopted in accordance with 2.4.2.

$J_{max} = 45/L_s$, but not more than 0.24;

$$F_1 = \frac{y^2}{E} - \frac{1}{E}\frac{y^3}{9} \text{ if } y < 1;$$

$$F_1 = \frac{y}{E} \frac{1}{12} \text{ if } y \geq 1;$$

$$F_2 = \frac{y^2}{E} - \frac{1}{12}\frac{y^3}{9} \text{ if } y < 1;$$

$$F_2 = \frac{y}{E} \frac{1}{12} \text{ if } y \geq 1;$$

$$y = J/

#### 2.8.6 The Values of $p_i$ Obtained from Formulae (2.8.4.2), (2.8.4.3) and (2.8.4.4) where the compartment considered extends over the mid-length $L_s$ should be reduced by an amount determined from Formula (2.8.5.4) in which case $F_2$ is calculated taking

$$y = J/J_{max}$$

where

$$J = J - E \text{ if } E \geq 0;$$

$$J = J + E \text{ if } E < 0.$$
2.8.7 For the purpose of ship subdivision by longitudinal watertight bulkheads, for a wing compartment, \( p_i \) determined in accordance with 2.8.4 and 2.8.8 should be multiplied by the reduction factor \( r \) to be obtained from the formulæ:

1 with \( J > 0,2b/B_1 \)

\[
\begin{align*}
    r &= \frac{b}{B_1} (2,3 + \frac{0,08}{J + 0,02}) + 0,1 & \text{if } b/B_1 \leq 0,2; \\
    r &= \left( \frac{b}{B_1} + 0,36 + \frac{0,016}{J + 0,02} \right) & \text{if } b/B_1 > 0,2
\end{align*}
\]

2 with \( J < 0,2b/B_1 \), the reduction factor \( r \) is to be determined by linear interpolation between \( r = 1 \) for \( J = 0 \) and the value of \( r \) obtained from the formulæ under 2.8.7.1 for \( J = 0,2b/B_1 \).

The value \( b \) should be determined in conformity with Appendix.

2.8.8 For groups of adjacent compartments, the parameter \( p_i \) is to be determined in accordance with 2.4.4.

For the case of simultaneous flooding of a wing and adjacent inboard compartment, \( p_i \) determined in accordance with 2.4.4 should be multiplied by the factor \((1 - r)\).

For groups of three adjacent compartments and more, \( p_i \) should be adopted equal to 0 if

1 (\( l_{ikm} - l_1 - l_2 \))/\( L_s > J_{\text{max}} \) — for a group of three adjacent compartments or, respectively,

2 (\( l_{ikm} - l_1 - l_2 \))/\( L_s > J_{\text{max}} \) — for a group of four adjacent compartments.

2.8.9 For a single compartment or group of adjacent compartments the factor \( s_i \) should be determined from the formula

\[
s_i = 0,5s_1 + 0,5s_p \tag{2.8.9}\]

where \( s_i \) is the \( s \) factor calculated for the deepest subdivision load line corresponding to the summer draught;

\( s_p \) is the \( s \) factor, calculated for the intermediate draught of a ship, corresponding to the light ship draught plus 60% of the difference between the summer draught and light ship draught.

2.8.10 Unless specified otherwise, the factor \( s \) for any condition of flooding from any initial loading condition permissible in operation should be as follows:

\[
s = C_i \sqrt[4]{0,5GZ_{\text{max}}/d} \tag{2.8.10}\]

with

\[
C_i = \begin{cases} 
1 & \text{if } 0 \leq \theta \leq 25^\circ \\
0 & \text{if } \theta > 30^\circ, \\
\sqrt{\frac{30 - \theta}{5}} & \text{if } 25^\circ < \theta \leq 30^\circ;
\end{cases}
\]

\( GZ_{\text{max}} \) is the maximum positive righting lever within the range, but not more than 0,1 m;

\( \theta \) is the range of positive righting levers for a damaged ship (angle of flooding considered) which is not to exceed 20°;

\( \theta_\text{e} \) is final equilibrium angle of heel, in degrees.

\( s = 0 \) where, in the final stage of flooding (equalization disregarded), the lower edge of openings through which progressive flooding may take place is immersed. Such openings should include the openings specified under 3.4.4.

If progressive flooding is taken into account in the calculations, the requirements of this regulation should be applied.

For intermediate draught and summer draught mark, the values of the height of centre of gravity above base line used for calculating the \( s \) parameters should not be less than the ultimate draught values to be found in the Information on Stability, Information on Damage Stability and Trim.

2.8.11 Where a horizontal subdivision is fitted above the watermark in question (waterline positions are defined under 2.8.9), \( s \) should be as follows:

1 the \( s \) value for the compartment or group of adjacent compartments located below the watertight horizontal subdivision above the subdivision load line or higher shall be obtained by multiplying the value as determined in 2.8.10 by the reduction factor \( v \) representing the probability that the spaces above the horizontal subdivision will not be flooded, and determined as follows:

\[
v = \frac{(H - d) - (H_{\text{max}} - d)}{(H - d)}
\]

\( H \) is to be restricted to the height of \( H_{\text{max}} \)

where

\( H \) is the height of watertight horizontal subdivision above the base line, in m, which is assumed to limit the vertical extent of damage;

\( H_{\text{max}} \) is the maximum possible vertical extent of damage above the base line, in m, or

\[
H_{\text{max}} = d + 0,056L_d(1 - l_s/500) \text{ for } L_s \leq 250 \text{ m};
\]

\[
H_{\text{max}} = d + 7 \text{ for } L_s > 250 \text{ m};
\]

whichever is less;

2 \( v \) = 1 if the uppermost watertight horizontal subdivision in way of the assumed damaged region is at a height above the base line which is less than \( H_{\text{max}} \).

2.8.12 In cases of positive contribution to index \( A \) due to simultaneous flooding of the spaces above the watertight horizontal subdivision, the resulting \( s \) value for such a compartment or group of adjacent compartments should be obtained by an increase of the value as determined by 2.8.11 by the \( s \) value for simultaneous flooding according to 2.8.10 multiplied by the factor \((1 - v)\).

2.8.13 In damage stability calculations, for the purpose of determining the probability subdivision index, the permeability of dry cargo holds should be adopted equal to 0,7.

2.8.14 With all compartments forward of the collision bulkhead flooded simultaneously, the \( s \) value calculated assuming the ship to be at its deepest subdivision load line and with assumed un-limited vertical extent of damage is to be equal to 1.
3 DAMAGE STABILITY

3.1 GENERAL

3.1.1 Under all loading conditions to be encountered in service and which are in agreement with the purpose of the ship (icing disregarded), the stability of an intact ship is to be sufficient for satisfying damage stability requirements.

3.1.2 Requirements for ship stability are to be considered satisfied if, in the case of damage mentioned under 3.2 and 3.5 and with the number of compartments mentioned under 3.5 being flooded, the permeability determined in accordance with 3.3, calculations made in conformity with 3.1.3 to 3.1.7 indicate that the requirements of 3.4 and 3.5 are satisfied.

3.1.3 Calculations to confirm compliance with 3.4 and 3.5 as regards damage stability should be made for such a number of loading conditions to be encountered in service and being the most unfavourable from the point of view of trim and stability (within the range of drafts up to the deepest subdivision waterline and cargo distribution stipulated by the design), such distribution and extent of damage, to be determined in accordance with 3.2 and 3.5, that, proceeding from those calculations, one could assure that in all other cases the damaged ship would be in a better condition as regards damage stability, the remaining freeboard and heeling angles. Hereby, the following is to be considered: the actual configuration of damaged compartments, their permeabilities, type of covers, whether intermediate decks, platforms, double sides, longitudinal and transverse bulkheads are provided sufficiently watertight as to render the flow of water through the ship completely or temporarily impossible.

3.1.4 Where the distance between two consecutive main transverse bulkheads is less than the damaged area, the relevant compartment should, at the discretion of the designer, be added to any of the adjacent compartments when checking damage stability. For non-passenger ships, relaxation from this provision may be granted where the arrangement of the bulkheads is in agreement with the condition \( A \geq R \).

3.1.5 Where two adjacent compartments are separated from each other by a stepped bulkhead, the bulkhead should be held for damaged when the flooding of any of the two compartments is considered.

Where the length of the step does not exceed one frame or 0.8 m, whichever is less, or where the step is formed by floors of the double bottom, this requirement may be dispensed with in the case of non-passenger ships.

3.1.6 If any damage of a lesser extent than stated under 3.2 and 3.5 might result in a more severe condition as regards damage stability and trim, such a damage should be considered when making check calculations for damage stability.

3.1.7 Where there are pipes, ducts or tunnels in the area of assumed damage, these should be so designed that no water enters compartments which are considered not flooded.

3.1.8 For passenger ships, the equalization time will be established on agreement with the Register proceeding from the ship type.

3.1.9 The arrangements for righting the ship after damage are to be approved by the Register and should be self-acting as far as practicable.

Where controllable cross-flooding arrangements are available, side-valve control stations should be located above the bulkhead deck.

3.2 EXTENT OF DAMAGE

3.2.1 Except cases specially provided for, the following extent of side damage should be assumed when making damage stability calculations to conform compliance with 3.4 and 3.5:

1. longitudinal extent: \( \frac{1}{3} L_1 \) or 14.5 m (whichever is less);
2. transverse extent measured inboard of ship side at right angles to the centre line at the level of the deepest subdivision loadline:
   1/5 of the ship breadth \( B_t \);
3. vertical extent: from the base line upwards without limit.

3.2.2 For ships of the length 100 m and upwards, the requirements of 3.4 should be complied with in the case of forward damage the length of which is composed by the minimal permissible forepeak length stated in 1.1.6.1, Part II "Hull" and the damaged length determined in accordance with 3.2.1.1.

3.3 PERMEABILITY

3.3.1 When calculating damage stability, the permeabilities should be assumed as stipulated by 2.2, except for the following:

1. the permeability of spaces intended for liquid cargoes (except for oil tankers, chemical tankers and
For non-passenger ships, a positive metacentric height below 0.05 m may be permitted for the upright condition in the final stage of flooding, if specially agreed with the Register, provided the curve of static stability of the damaged ship has the characteristics not lower than those specified in 3.4.3.

3.4.2 For unsymmetric flooding, the angle of heel should not exceed:
- 20° before equalization measures and cross-flooding fittings being used;
- 12° after equalization measures and cross-flooding fittings being used.

3.4.3 The static stability curve of a damaged ship is to have a sufficient positive lever arm section. In the final stage of flooding, cross-flooding fittings disregarded, and after the equalization of the ship, a length of positive lever arm curve, flooding angle considered, should be guaranteed of 30° in case of symmetric flooding on agreement with the Register, this value may be reduced, but not more than to 20°;

20° in case of unsymmetric flooding.

The maximum lever arm within this length should be at least 0.1 m.

In the intermediate stages of flooding, the maximum lever arm of the static stability curve should be at least 0.05 m, and the length of its positive section should not be less than 7°.

3.4.4 Before, during and after equalization, the damage waterline should be at least 0.3 m or 0.1 + (L1 – 10)/150 m, whichever is less, below the openings in the bulkheads, decks and sides through which progressive flooding could take place. Such openings include the outlets of air and vent pipes and those which are closed by means of watertight doors and covers. These may not include:

1. non-opening side and deck scuttles;
2. manholes having covers with closely spaced bolts;
3. cargo tank hatchways in tankers;
4. remotely controlled watertight sliding doors, as well as watertight doors and access hatch covers usually closed when at sea;
5. openings in subdivision bulkheads intended for the passage of vehicles during cargo-handling operations, closed with strong watertight covers while at sea. Such openings are permitted in ro-ro ships only including those mentioned in 3.5.2.2.

The position and arrangement of opening closures should meet the requirements of Section 7, Part III "Equipment, Arrangements and Outfit".

The position of spaces of emergency sources of electric power is to comply with the requirements of 9.2.1, Part XI "Electrical Equipment".

3.4.5 For non-passenger ships, immersion of the bulkhead deck and, moreover, of the weather deck is permitted.
3.4.6 The requirements of 3.4.1 to 3.4.5 apply to all ship types except those for which special provision is made in Ch. 3.5.

3.5 ADDITIONAL REQUIREMENTS FOR DAMAGE STABILITY

3.5.1 Passenger ships.

3.5.1.1 For passenger ships, damage stability should be checked on the assumption that all the passengers are crowding on the uppermost accessible decks.

In particular deck areas, the distribution of passengers should be determined proceeding from 3.1.7 and 3.1.8, Part IV "Stability" except when calculating the heeling moments included in Formula (3.5.1.12.2) in which case the distribution of passengers should be assumed in accordance with 3.5.1.13.

3.5.1.2 For the purpose of damage stability calculations, the following extent of damage should be adopted:

- longitudinal extent: 3 m plus 3 per cent of the ship length $L$, or 11 m (whichever is less);
- transverse and vertical extent should be adopted on the basis of 3.2.1.2 and 3.2.1.3.

3.5.1.3 With $N$ less than or equal to 600, damage stability requirements are to be satisfied when any single ship compartment is flooded, and with $N$ equal to or greater than 1200, those requirements are to be satisfied in the case of any two adjacent compartments being flooded.

3.5.1.4 In the case of passenger ships having $N$ between 600 and 1200, damage stability requirements are to be satisfied when any pair of adjacent compartments is flooded within that portion of ship length where a transverse bulkhead dividing two compartments is fitted closer to the foremost point of $L$, than $(N/600 - 1)L$, and when any single compartment is flooded within that portion of ship length where the bulkheads bounding the compartment are spaced farther than $(N/600 - 1)L$, from each other. For such ships, 1 should be introduced in the subdivision distinguishing mark.

Notwithstanding the requirements of 3.5.1.3 and the requirements of this paragraph, passenger ships (other than ro-ro passenger ships) certified to carry 400 persons or more, whose keels were laid on or after 1 July 2002, are to comply with the requirements of this Chapter, assuming the damage applied anywhere within the ship’s length.

3.5.1.5 For passenger ships having the length 100 m and more the requirements for damage stability and trim should be complied with in the case of three compartments being flooded simultaneously, namely, the forepeak and the two compartments which follow it, if the length of the compartment adjacent to the forepeak is less than the damage length stated in 3.5.1.2.

3.5.1.6 In the final stage of flooding, the initial metacentric height of a ship in the upright condition determined by the constant displacement method (before measures for its increase have been taken) should be at least:

$$0.05 \text{ m; } 0.015 B_2/F_1;$$
$$0.003 B_2^2 (N_1 + N_2)/(\Delta F_1),$$

where $\Delta$ is ship displacement before flooding, in t.

3.5.1.7 For unsymmetrical flooding, the angle of heel should not exceed:

- 15° before equalization measures and cross-flooding fittings being used;
- 7° after equalization measures and cross-flooding fittings being used with one compartment flooded and 12° with two or more adjacent compartments flooded.

3.5.1.8 The equalization time necessary for above requirements to be fulfilled is not to exceed 10 min.

3.5.1.9 During the intermediate stages of flooding or equalization, the heel should not exceed 20°, and the maximum lever arm of the static stability curve should not be less than 0.05 m with the length of positive section not less than 7°.

3.5.1.10 After the equalization of the ship and where no equalization is to be effected, after flooding, the damage waterline should be below the bulkhead deck outside the area flooded.

3.5.1.11 In the case of unsymmetrical flooding, the static stability curve of a damaged ship should have a positive lever arm section not less than 20° as measured from the equilibrium position both before and after equalization and/or cross-flooding fittings being used.

The positive lever arm section should be at least 0.015 m. rad. This area should be determined for the curve section between the heeling angle corresponding to the equilibrium position of the ship and flooding angle or an angle of 22° if one compartment is flooded and an angle of 27° if two or more adjacent compartments are flooded simultaneously, whichever is less.

3.5.1.12 Within the length stated under 3.5.1.11, the lever arm of static stability curve should not be less than the greater of the values:

1. 0.1 m or
2. value determined from Formula (3.5.1.12.2)

$$l = \frac{\text{heeling moment}}{\text{displacement}} + 0.04 \text{ m (3.5.1.12.2)}$$
In Formula (3.5.1.12.2), the greater heeling moment is used out of those due to:
all passengers crowding to one side (paras 3.5.1.13.1 to 3.5.1.13.3);
launching of all life-saving appliances with their full complement of persons on one side (paras 3.5.1.13.4 to 3.5.1.13.6);
wind pressure (paras 3.5.1.13.7 to 3.5.1.13.9).
The requirements of this paragraph apply to both symmetrical and unsymmetrical flooding.

3.5.1.13 The heeling moments as mentioned under 3.5.1.12 should be determined on the basis of the following assumptions:
.1 the density of distribution of passengers is assumed to be 4 persons per square metre of deck area accessible to them;
.2 the mass of each passenger is assumed to be 75 kg;
.3 passengers are crowding to one side on areas accessible to them of the decks where muster stations are located. Out of all possible variants of the crowding of passengers the one should be chosen providing for the greatest heeling moment;
.4 all the lifeboats and rescue boats of the side to which the ship has got a heel are assumed fully loaded, swung out and ready for launching. Where the launching of fully loaded lifeboats is to be effected from their stowage position, the maximum heeling moment likely to occur during launching is to be adopted for calculation.
The above assumptions are applicable to liferafts as well for which launching devices are provided;
.5 when determining the heeling moment due to life-saving appliances being launched, persons who are not in lifeboats or liferafts being swung out should not be considered a source of additional heeling or righting moments;
.6 life-saving appliances on the opposite side are assumed to be stowed for sea;
.7 wind pressure is assumed equal to 120 Pa;
.8 the above-water lateral plane area is determined for the initial draught of an intact ship;
.9 the lever arm of wind-pressure heeling moment is determined as the distance between the centre of effort and the point corresponding to half the mean draught of an intact ship.

3.5.1.14 When passenger ships of limited navigation areas I and II are equipped with life-saving appliances in conformity with 3.1.1.2, Part II "Life-Saving Appliances" of Rules for the Equipment of Sea-Going Ships, the requirements for damage trim and stability are to be satisfied in the case of any pair of adjacent compartments being flooded.

3.5.1.15 Ro-ro passenger ships certified to carry 400 persons or more should comply with the requirements for damage stability and trim, assuming the damage applied anywhere within the ship’s length.

3.5.2 Roll-on/roll-off ships, icebreakers and fishing vessels.

3.5.2.1 In Table 3.5.2.1, the number of compartments is indicated after the flooding of which the requirements of 3.4 for damage stability are to be satisfied.

<table>
<thead>
<tr>
<th>Type of ship</th>
<th>Length, m</th>
<th>Number of floodable compartments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roll-on/roll-off ships</td>
<td>170 and upwards</td>

</tr>
<tr>
<td>Icebreakers</td>
<td>50 and upwards</td>
<td>2</td>
</tr>
<tr>
<td>Fishing vessels</td>
<td>100 and upwards</td>
<td>1</td>
</tr>
</tbody>
</table>

3.5.2.2 Where vehicles accompanied by personnel of more than 12 persons including passengers (if any) are to be carried by roll-on/roll-off ships, such ships, irrespective of their length, should be considered equal to passenger ships in respect of all relevant requirements bearing in mind the provision of 3.4.4.5 if applicable according to 7.12.1.1, Part III "Equipment, Arrangements and Outfit".

3.5.2.3 In areas where double sides are provided, ice breakers having the length $L_4$ 50 to 75 m may satisfy the requirements of 3.4 where a single compartment is flooded. The subdivision distinguishing mark of such ships should include 1.

3.5.3 Special purpose ships.

3.5.3.1 In Tables 3.5.3.1-1 and 3.5.3.1-2, the number of compartments is indicated at the flooding of which the damage stability requirements of 3.4 are to be satisfied.

<table>
<thead>

3.5.3.2 Special purpose ships (except for motor ships and processing ships) having special personnel on board in excess of 200 persons should, in addition to 3.5.3.1, satisfy the requirements of the present Part pertaining to passenger ships carrying an equal number of passengers.

3.5.3.3 Mother ships and processing ships having special personnel on board in excess of 200 persons
should satisfy the requirements of the present Part for passenger ships carrying an equal number of passengers.

3.5.3.4 For mother ships and processing ships below 100 m in length carrying special personnel of not more than 50, the requirements of 3.4 for damage stability should be satisfied in the case of any single compartment except the machinery space being flooded. Nevertheless, damage trim and stability calculations for the case of the machinery space flooded should be submitted to the Register. No subdivision distinguishing mark is to be introduced in the class notation of such ships.

3.5.3.5 In the case of unsymmetrical flooding of a single compartment in special purpose ships, the heel angle after equalization is not to exceed 7°.

3.5.4 Tugs, dredgers, rescue ships and lightships.

3.5.4.1 If a single compartment is flooded, the damage stability requirements of 3.4 are to be satisfied for the following types of ships:
- tugs having the length \( L_1 > 40 \) m and upwards;
- dredgers having the length \( L_1 > 40 \) m and upwards;
- rescue ships and lightships — irrespective of length;
- hopper dredgers having the length \( L_1 = 60 \) m and upwards.

3.5.4.2 Where hopper dredgers and hopper barges are concerned, damage conditions may not be considered corresponding to ship condition after spoil discharge from one side.

3.5.5 Oil tankers and chemical tankers.

3.5.5.1 The damage stability of oil tankers and chemical tankers should satisfy the requirements of 3.4 both for the case of side and bottom damage.

3.5.5.2 Extent of bottom damage:
- .1 The longitudinal extent is to be \( 1/3L_1^{2/3} \) or 14.5 m (whichever is less) within \( 0.3L_1 \) from the forward perpendicular and \( 1/3L_1^{2/3} \) or 5 m (whichever is less) through the rest of the ship length;
- .2 the transverse extent is to be \( B_1/6 \) or 10 m (whichever is less) within \( 0.3L_1 \) from the forward perpendicular and \( B_1/6 \) or 5 m (whichever is less) through the rest of the ship length;
- .3 the vertical extent, measured from the moulded line of the shell at centre line, is to be \( B_1/15 \) or 6 m (whichever is less).

3.5.5.3 In addition to 3.5.5.2, bottom shell damage should be considered for oil tankers with a deadweight of 20000 t and upwards, having touched the ground, the extent of damage being as follows:
- .1 length of \( 0.6L_1 \) from the forward perpendicular for ships having a deadweight of 75000 t and upwards, and of \( 0.4L_1 \) from the forward perpendicular for ships having a deadweight below 75000 t;
- .2 breadth \( B_1/3 \) anywhere in the bottom.

3.5.5.4 Damage stability requirements are to be satisfied for the following locations of side and bottom damage:
- .1 oil tankers:
  - where the length \( L_1 \) exceeds 225 m — anywhere along the ship length;
  - where the length \( L_1 = 150 \) to 225 m — anywhere in the ship length except for the machinery space when this is located aft. In this case, the machinery space is to be considered a separate floodable compartment;
  - where the length \( L_1 = 150 \) m or below — anywhere in the ship length between consecutive transverse bulkheads except for the machinery space;
- .2 chemical tankers:
  - chemical tanker I — anywhere along the ship length;
  - chemical tanker II having the length \( L_1 \) over 150 m — anywhere along the ship length;
  - chemical tanker II having the length \( L_1 = 150 \) m and below — anywhere in the ship length except for the machinery space where this is located aft. In this case, the machinery space is to be considered a separate floodable compartment;
  - chemical tanker III having the length \( L_1 \) over 225 m — anywhere along the ship length;
  - chemical tanker III having the length \( L_1 \) between 125 and 225 m — anywhere in the ship length except for the machinery space where this is located aft. In this case, the machinery space is to be considered a separate floodable compartment;
  - chemical tanker III having the length \( L_1 \) below 125 m — anywhere in the ship length except for the machinery space where this is located aft. Nevertheless, damage stability and trim calculations for conditions of the machinery space flooded are to be submitted for the consideration of the Register.

3.5.5.5 Ships which do not comply with the requirements for damage trim and stability when their machinery space is flooded, as stipulated by 3.5.5.4.1 and 3.5.5.4.2, are not assigned a subdivision mark in their class notation.

3.5.5.6 In the final stage of unsymmetrical flooding before equalization measures and cross-flooding fittings being used, the angle of heel is not to exceed 25° (30° where the bulkhead deck is not immersed). After equa-lization measures, the heel angle should not exceed 17°.

3.5.5.7 Within 20° from equilibrium, the static stability curve area (both before and after equalization) should be at least 0.0175 m.rad.

3.5.6 Gas carriers.

For gas carriers, the requirements of 3.5.5 apply except for the following details:

3.5.6.1 Damage stability requirements are to be satisfied when side and bottom damage is sustained as stated below:
gas carrier I — anywhere along the ship length;
gas carrier II having the length \( L_1 \) over 150 m — anywhere along the ship length;
gas carrier II having the length \( L_1 \) 150 m or below — anywhere in the ship length except in way of the machinery space where this is located aft. In this case, the machinery space is to be considered a separate floodable compartment;
gas carrier IIIP — anywhere in the ship length between subdivision bulkheads;
gas carrier III having the length \( L_1 = 125 \) m and upwards — anywhere in the ship length between subdivision bulkheads;
gas carrier III having the length below 125 m — anywhere in the ship length between subdivision bulkheads except for the machinery space where this is located aft. However, damage trim and stability calculations for the case of the machinery space being flooded are to be submitted for the consideration of the Register. No subdivision distinguishing mark should be introduced in the class notation if damage stability and trim requirements are not met.

3.5.6.2 The vertical extent of a bottom damage is to be assumed \( B/15 \) or 2 m whichever is less.

3.5.7 Drilling ships.

With a single compartment flooded, drilling ships having the length \( L_1 \) below 160 m should satisfy the requirements of 3.4. For ships having the length \( L_1 > 160 \) m and upwards, the subdivision standard is to be specially considered by the Register in each case.

3.5.8 Ships intended for the carriage of radioactive agents.

Damage stability of ships intended for the carriage of radioactive agents is subject to special consideration of the Register.

3.5.9 Supply vessels.

3.5.9.1 The requirements of this Chapter apply to all supply vessels of 100 m in length or less.

The subdivision and damage stability of ships above 100 m in length will be specially considered by the Register.

3.5.9.2 Extent of damage.

For damage trim and stability calculations the depth of damage is to be assumed equal to 0.76 m and measured from the inner side at right angles to the centre line on the level of the deepest waterline permitted by the loadline. The requirements of 3.2.1.2 are not applicable.

3.5.9.3 Number of floodable compartments.

The damage stability requirements of 3.4 are to be satisfied in the case of single compartment flooding proceeding from the extent of damage stated under 3.2.1.1, 3.2.1.3 and 3.5.9.2.

3.5.9.4 Ships complying with the present Chapter only receive no subdivision distinguishing mark in the class notation.

3.5.9.5 If preferred by the Owner, a supply vessel may receive a subdivision distinguishing mark with the number of floodable compartments indicated in the class notation. In this case, the transverse extent of damage should be assumed in accordance with 3.2.1.2. The number of compartments at the flooding of which the damage stability requirements are to be satisfied should be determined by the Owner.

3.5.10 Ships with the ice marks \( \mathcal{L} \mathcal{Y} 4, \mathcal{L} \mathcal{Y} 5, \mathcal{L} \mathcal{Y} 6, \mathcal{L} \mathcal{Y} 7, \mathcal{L} \mathcal{Y} 8 \) and \( \mathcal{L} \mathcal{Y} 9 \) in the class notation.

3.5.10.1 The requirements of this Chapter apply to all the ships listed under 2.7.1.1 and to oil tankers.

For ships of the ice categories \( \mathcal{L} \mathcal{Y} 4, \mathcal{L} \mathcal{Y} 5, \mathcal{L} \mathcal{Y} 6, \mathcal{L} \mathcal{Y} 7, \mathcal{L} \mathcal{Y} 8 \) and \( \mathcal{L} \mathcal{Y} 9 \) not listed under 2.7.1.1, the applicability of the requirements of this chapter is determined on agreement with the Register.

Damage trim and stability calculations should be made within the limits of the draft \( d_{\text{ice}} \), irrespective of the freeboard assigned to the ship, provided the provisions of 1.4.2 are complied with.

3.5.10.2 Where the extent of damage is in accordance with 3.2, the damage stability requirements of 3.4 are to be satisfied if a single compartment is flooded in ships having the following marks in the class notation:

- \( \mathcal{L} \mathcal{Y} 7, \mathcal{L} \mathcal{Y} 8, \mathcal{L} \mathcal{Y} 9 \) — irrespective of ship length;
- \( \mathcal{L} \mathcal{Y} 5, \mathcal{L} \mathcal{Y} 6 \) — with the ship length \( L_1 \geq 90 \) m.

The subdivision distinguishing mark of such ships should include 1.

3.5.10.3 In addition to 3.5.10.2, ships with the ice marks \( \mathcal{L} \mathcal{Y} 4, \mathcal{L} \mathcal{Y} 5, \mathcal{L} \mathcal{Y} 6, \mathcal{L} \mathcal{Y} 7, \mathcal{L} \mathcal{Y} 8 \) and \( \mathcal{L} \mathcal{Y} 9 \) in the class notation (irrespective of their length) are to satisfy the requirements of 3.4 in the case of ice damage stated under 3.5.10.4 and the number of floodable compartments as stated under 3.5.10.5.

Where compliance with 3.5.10.2 or other chapters of this section testifies to the present paragraph being complied with, no additional damage stability calculations need be made for the damage conditions mentioned under 3.5.10.4.

3.5.10.4 For the purpose of damage stability calculations, the following extent of ice damage should be assumed:

- .1 longitudinal extent: 0.045 \( L_{\text{ice}} \) if the centre of damage lies within 0.4 \( L_{\text{ice}} \) from the forward perpendicular and 0.015 \( L_{\text{ice}} \) in other areas;
- .2 damage depth: 0.76 m as measured along the normal to the shell at any point in the area of assumed damage;
- .3 vertical extent: 0.2 \( d_{\text{ice}} \);
- .4 location of damage: from the base line to the level of 1.2 \( d_{\text{ice}} \) within \( L_{\text{ice}} \).

3.5.10.5 When making damage stability calculations, the number of floodable compartments should be determined proceeding from the location of the assumed ice damage listed in Table 3.5.10.5.
Table 3.5.10.5

¹Where the distance between two consecutive watertight structures is less than the extent of damage, relative adjacent compartments are to be considered a single floodable compartment when checking damage stability.

3.5.10.6 The requirements of 3.5.10.5 are not applicable where the machinery space located aft is flooded in ships having the ice marks as follows:
- \(L_5, L_6\) with the length \(L_1\) below 90 m;
- \(L_4\) with the length \(L_1\) below 125 m.

However, damage stability calculations for the case of the machinery space flooded are to be submitted for the consideration of the Register.

3.5.10.7 For oil tankers, chemical tankers II and III, gar carriers II and III below 150 m in length, the necessity of considering a simultaneous flooding of the machinery space and an adjacent compartment will be specially considered by the Register.

3.5.10.8 Ships conforming with 3.5.10.3 to 3.5.10.7 only will receive no subdivision distinguishing mark in the class notation.

3.5.11 Dry cargo ships.

3.5.11.1 Damage stability requirements of 3.4 are to be satisfied with the location of assumed side damage being as follows:
- where \(L_1 = 120\) m and above: anywhere in the ship length between subdivision bulkheads;
- where \(L_1 > 100\) m, but less than \(120\) m: anywhere in the ship length between subdivision bulkheads except for the machinery space where this is located aft.

Damage trim and stability calculations for conditions of the machinery space flooded are, nevertheless, to be submitted for the consideration of the Register.

As regards the class notation, 3.5.5.5 is applicable to these ships.

3.5.11.2 In addition to the requirements of 3.5.11.1 the bulk carrier which cargo hold is confined by the outer plating with the \(L_1\) of 150 metres and more, carrying hard bulk cargoes with density of 1000 kg/m³ and more, shall meet the requirements of 4.4 at flooding of any cargo hold in all cases of draught up to the summer loadline.

When calculating the damage stability the following permeabilities shall be taken:
0.90 for loaded holds;
0.95 for empty holds.

For ships which are assigned with the reduced freeboard in accordance with section 4 are regarded as satisfying the requirements of this paragraph.

Information about compliance with these requirements is to be contained in the Brochure required by 1.4.9.7, Part II "Hull".

3.5.12 Berth-connected ships.

3.5.12.1 Berth-connected ships are covered by the requirements of 3.4, 3.5.1.2, 3.5.1.6 - 3.5.1.10.

3.5.12.2 Damage stability requirements of 3.5.12.1 should be complied with in the case of any single flooded compartment lying along the ship periphery and having the length not less than required in 3.5.12.3.

3.5.12.3 For the purpose of damage stability and trim calculations, the following extent of damage should be assumed:
- .1 transverse extent measured from the inner skin at right angles to centre line on the level of the deepest waterline permitted by the loadline — 0.76 m;
- .2 longitudinal extent in accordance with 3.5.1.2;
- .3 vertical extent in accordance with 3.2.1.3.

3.5.12.4 In the final stage of flooding, cross-flooding fittings disregarded, and after equalization of the ship, the minimum range of positive righting lever curve is to be 20° beyond the angle of equilibrium, and the maximum righting lever is to be not less than 0.1 m within this range.

3.5.12.5 No subdivision mark will be inserted in the class notation of berth-connected ships which comply with the requirements of this Chapter only.

3.5.12.6 If the depth of waters on which the berth-connected ship floats is such that the lowermost deck accessible to passengers cannot be immersed not to mention capsizing of the ship, the requirements of this Part of the Rules may be waived.
4 SPECIAL REQUIREMENTS FOR TYPE "B" SHIPS WITH REDUCED FREEBOARD
AND FOR TYPE "A" SHIPS

4.1 GENERAL

4.1.1 This Section applies to type "A" and type "B" ships specified in 1.1.3.
The requirements of the Section shall be fulfilled irrespective of meeting the requirements of other sections by these ships.

4.1.2 The requirements are considered fulfilled where it is demonstrated by calculations that a ship being in assumed loading condition specified in 4.2 after the flooding of the number of compartments required by 4.1.3 — 4.1.5 caused by damages stipulated in 4.3 remains afloat and in a condition of equilibrium it meets the requirements of 4.4.

4.1.3 For type "A" ships above 150 m in length (L₁) the requirements of this Section are to be complied with in the case of any single compartment being flooded.

4.1.4 For type "B" ships above 100 m in length (L₁) for which the permitted reduction of tabular freeboard does not exceed 60% of the difference between its values as per Tables 4.1.2.3 and 4.1.3.2 of Load Line Rules for Sea-Going Ships, the following cases of flooding should be considered:

1. any single compartment with the exception of the machinery space;
2. any single compartment including the machinery space where the ship length exceeds 150 m.

4.1.5 Type "B" ships, having the length L₁ over 100 m, for which the permitted reduction in the tabular freeboard exceeds 60 per cent of the difference between its values as per Tables 4.1.2.3 and 4.1.3.2 of Load Line Rules for Sea-Going Ships shall be considered for the following cases of flooding:

1. any two adjacent compartments, except for the machinery space;
2. any two adjacent compartments and the machinery space considered separately in ships over 150 m in length.

4.1.6 The following permeabilities shall be assumed in calculations required by 4.1.2:

0.95 for any floodable compartments and spaces, except for the machinery space;
0.85 for floodable machinery space.
The permeability value of 0.95 is applicable to cargo spaces and tanks as well which are to be considered full when determining the height of the ship centre of gravity in conformity with 4.2.3.

4.2 TRIM AND LOADING CONDITION OF THE SHIP
PRIOR TO DAMAGE

4.2.1 All cases of flooding shall be analyzed under one assumed initial loading condition of the ship, as specified in 4.2.2 to 4.2.4.

4.2.2 The ship is considered to be loaded by homogeneous cargo to its draught up to the summer load line in salt water on an even keel.

4.2.3 The height of the centre of gravity of the ship shall be calculated for the following assumed loading condition:
1. All cargo spaces, except for those under 4.2.3.2, including the anticipated in service, partly filled spaces are considered to be fully loaded with dry cargo and to be 98 per cent loaded with liquid cargo.
2. Where the ship when loaded to the summer load line is to operate with some spaces not loaded or filled with dry or liquid cargo, such spaces shall be assumed empty provided that the height of the centre of gravity of the ship, calculated with regard to empty compartments is not less than that calculated on the assumption that all the spaces are occupied with cargoes.
3. The amount of every type of the ship's stores and consumable liquids is taken to be equal to 50 per cent of the full capacity. Tanks, except for those under 4.2.4.2, are assumed to be empty or completely filled, the distribution of the stores in the tanks resulting in the highest position of the centre of gravity of the ship.

The centres of gravity of the contents of the tanks mentioned in 4.2.4.2 are taken to be in the centres of gravity of their volumes.
4. Loading of the ship as regards consumable liquids and ballast water shall be estimated on the basis of the following values of their density, t/m³:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Density (t/m³)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Salt water</td>
<td>1.025</td>
</tr>
<tr>
<td>Fresh water</td>
<td>1.000</td>
</tr>
<tr>
<td>Fuel oil</td>
<td>0.950</td>
</tr>
<tr>
<td>Diesel oil</td>
<td>0.900</td>
</tr>
<tr>
<td>Lubricating oil</td>
<td>0.900</td>
</tr>
</tbody>
</table>

4.2.4 In estimating the height of the centre of gravity of the ship account shall be taken of the effect of free surfaces of liquids:
1. for liquid cargo, proceeding from loading specified in 4.2.3.1;
2. for consumable liquids, proceeding from the assumption that for every type of liquid at least one
centre-line tank or one transverse pair of tanks have free surfaces. To be taken into consideration are the tanks or the combination of tanks where the effect of free surfaces is the greatest.

It is recommended that the correction for free surfaces effect be taken into account in accordance with the Register’s Instructions of Estimating Liquid Cargo Free Surface Effect on Ship’s Stability.

4.3 EXTENT OF DAMAGE

4.3.1 The vertical extent of damage shall be assumed from the base line upwards without limit.

4.3.2 The transverse extent of damage measured inboard from the ship’s side, at a right angle to the centre line at the level of the summer load waterline shall be assumed equal to one-fifth of the breadth of the ship, or 11.5 m, whichever is the less.

4.3.3 If any damage of lesser extent than indicated in 4.3.1 and 4.3.2 would result in a more severe condition, such damage shall be assumed in the calculations.

4.3.4 Transverse bulkheads are considered effective if the distance between them or between the transverse planes passing through the nearest portions of the stepped bulkheads is at least \(1,3L_t^{1/3}\), or 14.5 m, whichever is the less. In case of lesser distance, one or more of these bulkheads shall be assumed as non-existent.

4.3.5 When one compartment is flooded, with due regard for provisions of 4.3.4, main transverse bulkheads are considered not to be damaged if they have no steps more than 3 m in length.

In case these bulkheads are provided with steps more than 3 m in length, the two compartments adjacent to such bulkheads are to be considered as flooded.

The extent of damage may be limited by transverse bulkheads of a side tank in case its longitudinal bulkheads are beyond the transverse extent of damage.

Where a side tank or a double bottom tank is divided by a transverse bulkhead located more than 3 m from a main transverse bulkhead, both tanks divided by such bulkhead should be considered as flooded.

The following compartments are to be considered as flooded:
- \(A + D, B + E, C + E + F\) (fig. 4.3.5-1);
- \(A + D + E, B + E\) (fig. 4.3.5-2);
- \(A + D, B + D + E\) (fig. 4.3.5-3);
- \(A + B + D, B + D + E\) (fig. 4.3.5-4);

4.3.6 Where a side tank has openings into a hold, it is to be considered as communicating with the hold even where such openings are fitted with closing
appliances. This provision is applicable to ships carrying liquid cargoes, except in case of sluice valves fitted in bulkheads between tanks and where the valves are controlled from above the bulkhead deck.

4.3.7 Where pipes, ducts or tunnels are located within the assumed extent of damage, satisfactory arrangements shall be provided to preclude the possibility of progressive flooding through them to other spaces beyond the limits assumed for the calculations of the damage stability of the ship.

4.3.8 In case of two-compartment flooding the requirements of 4.3.1 to 4.3.4, 4.3.6 and 4.3.7 shall be met.

4.4 STABILITY AND TRIM OF A SHIP IN DAMAGED CONDITION

4.4.1 The metacentric height of the ship in the damaged condition prior to taking measures for the increase thereof shall be positive.

4.4.2 The angle of heel due to unsymmetrical flooding prior to the beginning of the equalization of the ship shall not exceed 15°. If no part of the deck immerses, the increase of heel up to 17° may be allowed.

4.4.3 The final damage waterline having regard to heel and trim prior to the beginning of the equalization of the ship shall not be above the lower edge of openings indicated in 3.4.4, through which progressive flooding may take place.

4.4.4 When any part of the bulkhead deck beyond the limits of the flooded compartments immerses, or the margin of damage stability is doubtful, damage stability at large angles of heel is to be investigated. It shall be shown that the value of a maximum arm of the righting lever curve of a damaged ship is not less than 0,1 m in association with a range of the curve with positive arms of at least 20°, the area of the positive portion of the curve being not less than 0,0175 m.rad.
5 REQUIREMENTS FOR SHIPS IN SERVICE

5.1 REQUIREMENTS FOR ROLL-ON/ROLL-OFF PASSENGER SHIPS (RO-RO PASSENGER SHIPS)

5.1.1 Ro-ro passenger ships constructed before 1 July 1997 shall comply with the requirements of 5.1.3 not later than the date of the first periodical survey after the date of compliance prescribed below, according to the value of $A/A_{\text{max}}$ (ratio of the probability index $A$ as defined in 5.1.4 to the maximum probability index $A_{\text{max}}$ as defined in 5.1.5):

less than 85 per cent - not later than 1 October 1998,
85 per cent or more but less than 90 per cent - not later than 1 October 2000,
90 per cent or more but less than 95 per cent - not later than 1 October 2002,
95 per cent or more but less than 97.5 per cent - not later than 1 October 2004,
97.5 per cent or more - not later than 1 October 2005.

Number of floodable compartments should be adopted in accordance with the requirements of 3.5.1.3 and 3.5.1.4.

5.1.2 In addition to the requirements of 5.1.1 ro-ro passenger ships certified to carry 400 persons or more should comply with the requirements of 5.1.3.2 and 5.1.3.3, assuming the damage applied anywhere within the ship’ length, not later than the date of the first periodical survey after the date of compliance prescribed in 5.1.2.1, 5.1.2.2 and 5.1.2.3 which occurs the latest:

\[ A/A_{\text{max}}: \]
less than 85 per cent - not later than 1 October 1998,
85 per cent or more but less than 90 per cent - not later than 1 October 2000,
90 per cent or more but less than 95 per cent - not later than 1 October 2002,
95 per cent or more but less than 97.5 per cent - not later than 1 October 2004,
97.5 per cent or more - not later than 1 October 2010;

\[ A_{\text{max}}: \]
1500 or more - not later than 1 October 2002, 1000 or more but less than 1500 - not later than 1 October 2006,
600 or more but less than 1000 - not later than 1 October 2008,
400 or more but less than 600 - not later than 1 October 2010.

\[ A: \]
Age of the ship equal or greater than 20 years, (where the age of the ship means the time counted from the date on which the keel was laid or the date on which it was at a similar stage of construction or from the date on which the ship was converted to a ro-ro passenger ship).

5.1.3 Requirements for damage stability and trim.
5.1.3.1 When performing damage stability and trim calculations account must be taken of the requirements of 3.1.1, 3.1.2, 3.1.4 - 3.1.7, 3.1.9. References to 3.2, 3.4 and 3.5 in the above paragraphs have been replaced by reference to 5.1.3.6.
5.1.3.2 In the final stage of symmetric flooding before appropriate measures to increase metacentric height are taken the initial metacentric height of a ship in the upright condition determined by the constant displacement method should not be less than 0.05 m.
5.1.3.3 The statical stability curve for the final stage of flooding (after equalization, if effected) should have a positive range not less than 15°. Within the range stated above the area under the lever curve and the maximum lever arm of statical stability curve should comply with the requirements of 3.5.1.11 and 3.5.1.12.
5.1.3.4 During the intermediate stages of flooding, stability should comply with the requirements of 3.5.1.9.
5.1.3.5 For the purposes of damage stability calculations, the permeabilities of spaces and surfaces should be generally assumed equal to the values to be determined from Table 5.1.3.5.

<table>
<thead>
<tr>
<th>Spaces</th>
<th>Permeability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spaces intended for carriage of coal or stores</td>
<td>0.60</td>
</tr>
<tr>
<td>Accommodation spaces</td>
<td>0.95</td>
</tr>
<tr>
<td>Spaces occupied by machinery</td>
<td>0.85</td>
</tr>
<tr>
<td>Spaces intended for liquid cargoes</td>
<td>0 or 0.95 1</td>
</tr>
<tr>
<td>Ro-ro cargo spaces</td>
<td>0.90</td>
</tr>
</tbody>
</table>

1 That value should be taken, which results in more severe requirements

Higher surface permeabilities should be assumed for those spaces which are not occupied by substan- tional numbers of accommodation rooms or machinery in the vicinity of the damage waterline as well as for spaces which are not generally occupied by any substantial quantities of cargo or stores.

5.1.3.6 For the purpose of compliance with the requirements for damage stability and trim laid down in 5.1.3 the extent of damage is adopted on the basis of 3.5.1.2.

5.1.3.7 The trim of a damaged ship should comply with the requirements of 3.5.1.7; the equal-
ization time necessary for the above requirements to be fulfilled is not to exceed 15 min.

5.1.3.8 The damage waterline after the equalization of the ship and where no equalization is to be effected should be 76 mm below the bulkhead deck.

5.1.4 The probability index \( A \) is determined from the formula:

\[
A = \Sigma a_{\text{aps}}.
\]

To be summed up are the single compartments and groups of two adjacent compartments.

5.1.4.1 For the purpose of determining the index \( A \) the ship is considered to be loaded to the deepest subdivision waterline, with null or designed (if any) trim and with maximum height of centre of gravity which may occur in the ship’s service.

The permeabilities are assumed in compliance with 2.2.1.1, 2.2.1.2, 2.2.1.4 and 2.2.4.

For spaces of ro-ro ships the permeability should be assumed to be equal to 0.90.

5.1.4.2 The factors \( a \) and \( p \) are determined in conformity with 2.4. The value of the factor \( k_p \) is assumed to be equal to 1.

5.1.4.3 The factor \( s \) is determined from the formula

\[
s = 2.58e^{\frac{4}{\sqrt{GZ_{\text{max}}}} \psi} \Omega,
\]

where \( GZ_{\text{max}} \) is the maximum positive righting lever for a damaged ship within the range of 15° from the position of equilibrium but not more than 0.1 m;

\( \psi \) is the range of positive righting lever in degrees but not more than 15°;

\( \Omega \) is the positive lever arm section (m rad) of the statical stability curve for a damaged ship, determined in conformity with 3.5.1.11, but not more than 0.015 m rad;

\( c \) is the factor equal to:

\( c = 1 \) if the heeling angle in the final stage of flooding \( \theta_h \) does not exceed 7°;

\( c = \sqrt{\frac{20 - \theta_h}{13}} \), if 7° < \( \theta_h \leq 20° \),

\( \theta_h \) is the heeling angle in the final stage of flooding (before equalization), degrees.

5.1.4.4 Where the damage stability and trim satisfy fully the requirements of 3.5.1 the factor \( s \) shall be taken as 1.

\( s \) shall be taken as zero for any case of flooding which results:

during intermediate flooding or prior to equalization, in the angle of heel in excess of 20° or which immerses any openings through which down-flooding might take place, or

for the final stage of flooding, except in way of the flooded compartment or compartments, in immersion of the bulkhead deck, or

in heel in excess of 12°, or

\( h_d \) less than 0.05 m.

5.1.4.5 If subdivision of the ship by longitudi

dwatertight bulkheads is taken into account the value of

\( p \) is multiplied by the reduction factor \( r \) obtained in compliance with 2.6.4.2 at \( k_p = 1 \).

5.1.5 Where the value \( s < 1 \) in case of flooding of any single compartment in a ship which requires the one-compartment subdivision standard (number of persons on board is less than 400) or in case of any two adjacent compartments being flooded in a ship, for which the two-compartment subdivision standard is required (number of persons on board is equal or greater than 400), provision is to be made for calculating the maximum probability index \( A_{\text{max}} \) or \( A_{\text{max}2} \) in the same way as \( A_1 \) or \( A_2 \) but the value of \( s \) is assumed to be equal to 1 in case of:

flooding of every compartment in a ship which requires the one-compartment subdivision standard,

flooding of every two adjacent compartments in a ship which requires the two-compartment subdivision standard.

5.1.6 The value \( A/A_{\text{max}} \) is calculated from the following formulae:

for the one-compartment subdivision standard

\[
\frac{A}{A_{\text{max}}} = \frac{A_1}{A_{\text{max}1}} \quad \text{or} \quad \frac{A}{A_{\text{max}}} = \frac{A_1 + A_2}{A_{\text{max}1} + A_{\text{max}2}},
\]

for the two-compartment subdivision standard

\[
\frac{A}{A_{\text{max}}} = \frac{A_1 + A_2}{A_{\text{max}1} + A_{\text{max}2}},
\]

where

\( A_1 \) is a part of the value \( A \) determined in accordance with 5.1.4 for the cases where one compartment is flooded;

\( A_2 \) is a part of the value \( A \) determined in accordance with 5.1.4 for the cases where two adjacent compartments are flooded;

\( A_{\text{max}1} \) is a part of the value \( A \) determined in accordance with 5.1.5 for the cases where one compartment is flooded;

\( A_{\text{max}2} \) is a part of the value \( A \) determined in accordance with 5.1.5 for the cases where two adjacent compartments are flooded.

5.2 BULK CARRIERS

5.2.1 The bulk carrier, which cargo hold is confined by the outer plating with an length \( L_1 \) of 150 m and more built before 1 July 1999 carrying hard bulk cargoes with density of 1780 kg/m³ and more, is to comply with the requirements of Chapter 4.4 while flooding the fore cargo hold in all cases up to the summer load line not later than the date of survey assigned in relation to the ship age:

.1 for ships which age at 1 July 1998 is 20 years and more, the date of the first intermediate (the second or the third annual survey) or the first special survey, which is to be carried out after 1 July 1998 is accepted, whichever is earlier;
.2 for ships which age at 1 July 1998 is 15 years and more but less than 20 years, the date of the first special survey which is to be carried out after 1 July 1998 but not later than 1 July 2002 is accepted;

.3 for ships which age at 1 July 1998 is less than 15 years, the date of the third special survey or the date when the ship’s age becomes equal to 15 years is accepted, whichever is later.

5.2.2 The following values of permeabilities are to be taken for the damage stability calculations:

0.90 for loaded holds;

0.95 for empty holds.

5.2.3 The ships which don’t comply with the requirements of 5.2.1 may be acquitted from this requirement provided the following conditions are met:

1. The programme of the fore hold annual survey is replaced by the programme approved at the full scale intermediate survey in accordance with the section 2, Part III "Additional surveys of ships in relation to their purpose and hull material" Rules for the Classifications Surveys of Ships.

2. The visual and audible alarm shall be fitted in the wheelhouse for signalling in case of:

- flooding over two metres above the double bottom in the stern part of each cargo hold;
- filling of bilge well of each hold up to the upper level.

Such signalling system shall meet the requirements of Part XI "Electrical equipment".

The ship is to be supplied with detailed information on the effect of the phased flooding of cargo hold and detailed instructions in accordance with the Chapter 8, Part II "The Management Rules for the Safe Operation of Ships and for Pollution Prevention".

5.2.4 The ships which are assigned with the reduced freeboard in accordance with Section 4 are considered compliant with the requirements of this Chapter.

5.2.5 Information on compliance with the requirements of this Chapter are to be contained in the Brochure required by 1.4.9.7, Part II "Hull".

</table>

**Notes:**
1. When determining the probability values of r*, it is to be assumed than in compartments 1 (Figs 2 and 3), 2 and 3 (Fig. 1) an inner side is available being a continuation of the existing one.
2. The compartment arrangements to be found in the Table should be considered flooded when determining the values of cs.
3. In the tables:  
- l_{1-2} = l_1 + l_2
- l_{1-3} = l_1 + l_2 + l_3
- l_{1-4} = l_1 + l_2 + l_3 + l_4
- l_{1-5} = l_1 + l_2 + l_3 + l_4 + l_5

**Fig. 3**
If $r$ is calculated for a group of two or more compartments, the value of $b$ is the same for all compartments of this group, and it is equal to the least $b$ value in this group:

\[ b = \min(b_1, b_2, \ldots, b_n), \]

where $n$ is the number of side compartments comprising this group;\[ b_1, b_2, \ldots, b_n \]is the mean value of $b$ for individual side compartments forming this group.
PART VI. FIRE PROTECTION

1 GENERAL

1.1 APPLICATION

1.1.1 This Part of the Rules applies to ship’s structural fire protection, fire extinguishing systems and fire detection and alarm systems, as well as fire fighting equipment and outfit.

1.1.2 The fire protection requirements relating to the structural items of the ship hull, machinery and parts thereof, electrical equipment, pumping and piping, ship’s arrangements, fuel and lubricating oil tanks, construction and location of boilers, refrigerating plants, ship’s spaces, etc. are set out in the relevant parts of the Rules.

1.2 DEFINITIONS AND EXPLANATIONS

The definitions and explanations relating to the general terminology of the Rules are given in the General Regulations for the Supervision.

The following definitions have been adopted in this Part of the Rules.

Cargo area is that part of the ship that contains cargo tanks, slop tanks and pump rooms, cofferdams, ballast and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the parts of the ship over the above-mentioned spaces.

Dangerous goods. For the purpose of these Rules and in accordance with the existing classification the following is considered as dangerous goods:

Class 1 — Explosives (Classes 1.1; 1.3; 1.4; 1.5).
Class 2 — Gases: compressed, liquefied or dissolved under pressure.
Class 3 — Flammable liquids.
Class 4 — Flammable solids (Class 4.1); substances liable to spontaneous combustion (Class 4.2); substances, which in contact with water emit flammable gases (Class 4.3).
Class 5 — Oxidizing substances (Class 5.1) and organic peroxides (Class 5.2).
Class 6 — Poisonous and infectious substances. Poisonous substances (Class 6.1).
Class 7 — Radioactive substances.
Class 8 — Corrosives.
Class 9 — Miscellaneous dangerous substances.

Explosives of Class 1.4, compatibility group S are substances and articles which present only a small hazard and are so packaged or designed that any hazardous effects are confined within the package.

Flammable liquids are liquids, or mixtures of liquids, or liquids containing solids in solution or suspension (e.g. paints, varnishes, lacquers, etc.) which give off flammable vapours at or below 60°C closed cup test.

Main vertical fire zones are those sections into which the hull, superstructure and deckhouses are divided by "A" class divisions, the mean length and width of which on any deck does not in general exceed 40 m. The length or width of a main vertical zone is the maximum distance between the furthermost points of the bulkheads bounding it.

Fire Test Procedures Code means the International Code for Application of Fire Test Procedures, as adopted by the IMO Maritime Safety Committee by Resolution MSC.61(67).

A standard fire test is a test in which the specimens of the relevant bulkheads and decks are exposed in a test furnace to temperatures corresponding approximately to the time-temperature curve. The test methods are to be in correspondence with the Fire Test Procedures Code.

"A" class or fire-resisting divisions are those divisions which comply with the requirements set out in 2.1.2.1 to 2.1.2.4, 2.1.3.1 to 2.1.3.6, 2.1.3.8 and 2.1.3.9.

"B" class or fire-retarding divisions are those divisions which comply with the requirements of 2.1.2.5.

"C" class divisions are those divisions which are constructed of approved non-combustible materials. They need meet no requirements relative to the passage of smoke and flame nor the limiting of temperature rise.

Materials equivalent to steel means any non-combustible material which, by itself or due to insulation provided, has structural and integrity properties equivalent to steel at the end of the applicable fire exposure during a standard fire test (e.g., aluminium alloy with suitable insulation).

Continuous "B" class ceilings or linings are those "B" class ceilings or linings which terminate at an "A" or "B" class division or at outer surfaces of the ship.

Lower flammable limit (LFL) is minimum concentration of oil gases and vapours in air capable of igniting from a source of ignition and propagating combustion in the mixture.

A standard fire test specimen is a specimen of the bulkhead or deck, having a heat-exposed surface of not less than 4,65 m² and a height (or length,
in the case of decks) of 2.44 m resembling as closely as possible the intended construction and including, where appropriate, at least one insulation joint (but).

Adjacent compartments or spaces are those compartments or spaces which are separated from one another by a bulkhead, deck, platform, or any other fixed division without openings or with openings provided with means of closure.

Compartments or spaces continuous to one another at the corners only are not considered as adjacent.

Compartments and spaces separated from one another by removable divisions (i.e. those removable under normal service conditions) or having openings not fitted with means of closing, in the bulkhead or deck that separates them, are considered as one single space.

Protected space is a space equipped with one of the fire extinguishing systems or with an automatic fire detection system.

Rooms containing furniture and furnishings of restricted fire risk for the purpose of application on ships carrying more than 36 persons are the rooms (whether cabins, public spaces, offices or other types of accommodation referred to in 1.5.2) in which:

all furniture, such as desks, wardrobes, dressing tables, bureaux, dressers, is constructed entirely of approved non-combustible materials, except that a combustible veneer not exceeding 2 mm in thickness may be used on the working surface of such articles;

For the purpose of this Part of the Rules the following explanation have been adopted: all freestanding furniture, such as chairs, sofas, tables, is constructed with frames of non-combustible materials;

all draperies, curtains and other suspended textile materials have qualities of resistance to the flame propagation not inferior to those of wool of mass 0.8 kg/m², this being determined in accordance with the Fire Test Procedures Code;

all floor coverings have low flame spread characteristics;

all exposed surfaces of bulkheads, linings and ceilings have low flame spread characteristics;

all upholstered furniture has qualities of resistance to the flame ignition and propagation, this being determined in accordance with the Fire Test Procedures Code;

all bedding components have qualities of resistance to the flame ignition and propagation, this being determined in accordance with the Fire Test Procedures Code.

Fire control station is a position where starting controls of fire extinguishing systems or items of fire fighting outfit or fire alarm indicating units for a particular part of the ship (compartment, main vertical fire zone, individual spaces) are arranged.

Main fire control station is a room or part thereof, where the following control and indicator functions are centralized:

- fixed fire detection and alarm systems;
- automatic sprinklers, fire detection and alarm systems, as well as remote starting controls of other fire fighting systems;
- fire door indicator panels;
- fire door closures;
- watertight door indicator panels;
- watertight door closures;
- ventilation fans;
- general/fire alarms;
- communication systems including telephones;
- microphones for public address systems.

A system equivalent to a deck foam system for cargo tanks is a system which shall be capable of extinguishing spill fires, precluding ignition of spilled oil not yet ignited and combating fires in ruptured tanks.

A system equivalent to a fixed inert gas system is a system which shall be capable of preventing dangerous accumulations of explosive mixtures in intact cargo tanks during normal service throughout the ballast voyage and necessary in tank operations and so designed as to minimize the risk of ignition from the generation of static electricity by the system itself.

Combustible medium is flammable liquids; flammable gases, compressed, liquefied or dissolved under pressure; solid combustible materials and substances, including cargoes, fuel, fishing materials, equipment, insulation, furniture.

Primary deck covering is a deck covering applied directly on the metal deck, including anticorrosive coatings and an adhesive, but excluding a finishing covering (linoleum, carpets, etc.).

Crude oil means any oil occurring naturally in the earth whether or not treated to render it suitable for transportation and includes crude oil from which certain distillate fractions may have been removed and crude oil to which certain distillate fractions may have been added.

Flash point is the lowest temperature at which the vapours of a flammable liquid form with the ambient air a mixture capable of igniting at an open flame.

The flash point of flammable liquids shall be determined in closed cup by means of an approved flash point apparatus.

Structural fire protection is a complex of the passive means of structural fire protection intended for:

- prevention of fire;
- containment of flame and smoke spreading throughout the ship;
creation of conditions for safe evacuation of people from the ship's spaces and from the ship, as well as for effective extinguishment of the fire.

Foam expansion ratio is the ratio of the volume of foam produced to the volume of the mixture of water and foam-making concentrate required.

Fire fighting equipment and systems are those active fire fighting measures which are intended for extinguishing and containment of fire spreading throughout the ship.

Rated volume of a protected space is the gross volume of a space bounded by watertight or gastight bulkheads and decks without any deduction for the volume occupied by equipment, machinery, structural items, tanks, cargo, etc.

Fire fighting outfit is portable fire fighting equipment (apparatus, appliances, consumable materials) intended for:
- extinguishing a fire;
- ensuring effective fire fighting actions of the crew;
- ensuring operation of fire fighting system.

Water-screen systems are systems which create a water barrier in the form of sufficiently thick curtain of water fed through spray nozzles. Such systems are fitted where the use of fire-resistant divisions is impracticable.

Water drenching systems are those systems which supply water onto vertical or horizontal ship's structures.

Fire detection and fire alarm systems are subdivided into:
- fire detection systems designed for sending signal (automatically and/or manually) from the place where a fire has broken out to the main fire control station and fire warning alarms designed to inform the crew and special personnel in the protected space that a fire extinguishing medium is on the point of being discharged.
- Fixed fire extinguishing systems are those systems which are intended to supply fire extinguishing medium to the protected spaces or directly therein and structurally fixed to the ship's hull.

Smothering is filling of a protected space with a medium not supporting combustion.

Surface extinction is cooling, wetting or restriction of oxygen access to burning surfaces.

Slop tank is a tank intended for accumulation of slops after washing of cargo tanks and contaminated ballast water.

Fire and rescue operations control station in ships having a distinguishing mark of provision with means for fighting fires aboard other ships in their class notation is a room or part thereof, where control functions on fighting fire on another object, and rescue of the objects and people in distress are centralized.

1.3 SCOPE OF SUPERVISION

1.3.1 General regulations for the classification, supervision of ships under construction and classification surveys, as well as the requirements for the documentation to be submitted to the Register for consideration are set out in General Regulations for the Supervision and in Part I "Classification".

1.3.2 Subject to supervision of the Register during construction of a ship are: structural fire protection, materials used for the interior finishing of ship's spaces, as regards fire hazardous properties thereof, fire extinguishing, fire detection and alarm systems subject to the provisions of this Part of the Rules, except for fire fighting outfit which is only to be checked for complete availability in accordance with the rates specified in this part of the Rules and for correct location.

1.3.3 The following shall be submitted to the Register for approval of newly applied active fire fighting means and passive measures of structural fire protection:

.1 Type Approval Certificates (if available), test records and other essential documents on fire tests run by competent bodies, confirming the efficiency of a fire extinguishing medium with the recommended standards on composition and application rates, as well as information on storage life and conditions;

.2 Type Approval Certificates (if available) and other essential documents on the fire tests of "A" and "B" class fire-proof divisions and closures of openings in such divisions ("A" and "B" class doors included);

.3 drawings of fire-proof divisions together with the data which certify their compliance with "A" and "B" class divisions according to the requirements of this Part of the Rules;

.4 data on the combustibility of the materials with reference to the documents certifying the performance of appropriate tests of the materials concerned;

.5 drawings and calculations for individual standard assemblies (equipment) of the fire extinguishing, fire detection and alarm systems;

.6 drawings of standard components of the ventilation system of accommodation, service, cargo, machinery and working spaces, indispensable for ensuring fire safety of the ship.

1.4 FIRE PLANS

1.4.1 At the main fire control station, wheelhouse or in conspicuous positions in corridors and lobbies of any ship, there shall be exhibited general arrangement plans clearly showing the following for each deck:
.1 location of control stations;
.2 arrangement of fire-resisting and fire-retarding divisions;
.3 spaces protected by the fire detection and alarm system;
.4 spaces protected by fixed fire extinguishing systems with indication of the location of instruments and fittings for their control and also the disposition of fire hydrants;
.5 means of access to different compartments, decks, etc., with indication of escape routes, corridors and doors;
.6 ventilation system including the controls of fans and showing the disposition of dampers and the identification numbers of the fans;
.7 arrangement of fire fighting outfit;
.8 location of the documents referred to in 1.4.6.

1.4.2 In lieu of the plans, information specified in 1.4.1 may be set out in a booklet, a copy of which shall be supplied to each officer, and one copy at all times shall be available on board in an accessible position.

1.4.3 A duplicate set of the plans or the booklet protected against marine environment shall be permanently stowed outside the deckhouse in a weathertight enclosure painted red and marked as indicated in Figure 1.4.3-1.

The enclosure shall be capable of being easily opened, be readily available to the shoreside firefighting personnel, be located in a well-illuminated position, if possible including illumination from an emergency source.

In oil tankers, chemical tankers and gas carriers the enclosure of fire control plans shall not be located on exterior bulkheads of superstructures which face cargo area and the surfaces within 3 m from them along the side.

If the enclosure is not adjacent to the gangway, there shall be guide signs as indicated in Figure 1.4.3-2 showing the way thereto. The dimensions of the signs are to be not less than 300 × 400 mm.

In cargo ships of less than 150 gross tonnage the duplicate set may be omitted.

Fig. 1.4.3-1

Fig. 1.4.3-2

1.4.4 Description in such plans and booklets shall be in the state language and in the English/French language. The symbols for items listed in 1.4.1 are to be in agreement with IMO Resolution A.654(16) "Graphical Symbols for Fire Control Plans.
For ships not engaged on international voyages, translation into English is not required, and the graphical symbols are to be coloured.

1.4.5 All alterations in the fire protection of a ship shall be entered in the ship’s documents stated in 1.4.1 and 1.4.2.

1.4.6 To be kept in a separate file in an accessible position are technical instructions for maintenance and use of all ship’s installations for extinguishing and containment of fire.

1.5 CATEGORIES OF SHIP’S SPACES

1.5.1 Control stations:
.1 spaces containing the main navigational instruments and ship’s control equipment, radio equipment, public address system stations, main fire control stations, fire extinction stations, spaces containing storage batteries and generators for radio stations;
main control station (see 1.2, Part VII "Machinery Installations") provided it is located beyond the machinery space;
fire and rescue operations control station;
.2 spaces containing emergency sources of power;
.3 spaces containing equipment for the control of submersion, emersion and heeling.

1.5.2 Accommodation spaces:
.1 crew’s quarters, cabins for passengers and special personnel, including medical service rooms and offices;
.2 public spaces, such as lounges, messrooms, dining rooms, smoking rooms, cinema halls, libraries, reading rooms, gymnasiums, hairdresser’s and barber’s saloons, sheltered verandas, nurseries, games and hobbies rooms, shops, information counters, offices, pantries containing no cooking appliances;
3 sanitary spaces: toilets, lavatories, washrooms, shower-rooms, bath-rooms, changing rooms, indoor swimming pools, operating rooms, etc.

1.5.3 Service spaces:
1.5.3.1 Domestic service spaces:
.1 galleys, water heater rooms, bakeries, confectioneries, etc., containing solid-fuel-fired, oil-fired or gas-fired equipment;
.2 same as under 1.5.3.1.1, but containing electrically heated equipment, as also ironing rooms, saunas, shoe-repair and tailor's shops, main pantries, post offices;
.3 provision rooms, sculleries, food preparation shops.
1.5.3.2 Storerooms, garages and hangars:
.1 storerooms for explosives;
.2 storerooms for readily flammable materials and substances: paint lockers, spaces for flammable liquids, flammable liquefied and compressed gases, hangars for helicopters, sheltered garages, fuel distribution systems;
.3 storerooms for combustible materials: boatswain's and carpenter's stores, ship's document files rooms, film storage rooms, baggage rooms, rooms of articles for recreation, customs rooms, mail rooms, overall lockers, linen lockers, drying rooms, manufactured goods sale shops, bookstalls, laundries;
.4 storerooms for non-combustible materials: stores of spare parts, storerooms for mechanical and electrical shops other than those forming part of machinery spaces, pantries.
1.5.3.3 Cargo control stations containing arrangements for control, monitoring and alarm of the cargo oil system (see 1.2, Part VII "Machinery Installations").

1.5.4 Cargo spaces:
.1 cargo tanks intended for the carriage of liquids in bulk, slop tanks included;
.2 spaces for dry cargoes other than ship stores: dry cargo and refrigerated cargo holds and 'tween-decks, including those intended also for carriage of containers and portable tanks, dangerous goods in packaged form or in bulk, motor vehicles without fuel in their tanks; storage spaces for ready produce, utilizable refuse, fishing equipment, packages, etc., as well as produce discharge trunks, cargo lifts and access trunks leading to such spaces;
.3 ro-ro cargo spaces not normally subdivided in any way and extending to either a substantial length or the entire length of the ship. Goods packaged or in bulk, on rail or road cars, vehicles (including road or rail tanks), trailers, containers, pallets, demountable tanks can be loaded and unloaded normally in a horizontal direction into the following spaces:
.3.1 closed ro-ro cargo spaces;
.3.2 open ro-ro cargo spaces either open at both ends, or open at one and provided with adequate natural ventilation effective over their entire length through permanent openings in the side plating or deckhead;
.3.3 weather deck which is completely exposed to the weather from above and from at least two sides.
1.5.5 Machinery spaces — see definition of 1.2, Part VII "Machinery Installations".
1.5.6 Oil fuel and lubricating oil tanks are main storage tanks, service tanks, drainage tanks, overflow tanks, settling and other tanks.
1.5.7 Pump rooms are spaces containing cargo pumps in oil tankers and combination carriers.
1.5.8 Working spaces are shops and workshops (other than those forming part of machinery spaces), laboratories and other spaces where:
.1 oil fuel or flammable liquids are used or combustible materials are processed;
.2 neither flammable liquids are used, nor combustible materials are processed.
1.5.9 Special category space is that enclosed space in a passenger ship intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion, into and from which such vehicles can be driven and to which passengers have access.
1.5.10 Special electrical spaces — see 1.2, Part XI "Electrical Equipment".

1.6 SUBDIVISION OF MATERIALS IN ACCORDANCE WITH THE FIRE TEST PROCEDURES CODE

1.6.1 All non-metal materials other than those referred to in 1.6.4 are tested for combustibility and subdivided into non-combustible and combustible.

Non-combustible material is a material which neither burns nor gives off flammable vapours in the amount sufficient for self-ignition when heated to 750°C approximately. Any other material is a combustible material.

1.6.2 Materials used as finish materials of bulkheads, ceilings and decks are tested for surface flammability and, if the test results are satisfactory, low surface flame spread characteristics are assigned thereto.

Low flame spread means that the surface thus described in accordance with the Fire Test Procedures Code will adequately restrict the flame spread.

1.6.3 Permanent (primary) deck coverings of 5 mm and more in thickness are tested for ignitability and subdivided into not readily ignitable and readily ignitable.

Not readily ignitable deck coverings are coverings which in the process of testing do not give off flammable vapours in sufficient quantity to maintain flame burning during more than 10 s.
R e a d i l y  i g n i t i b l e  d e c k  c o v e r i n g s  a r e coverings which in the process of testing maintain flame burning during more than 10 s.

1.6.4 Textiles and films used for manufacture of curtains, blinds and other hanging articles are tested for the flame resistance. The materials which have passed the test are considered suitable for the above purposes.

1.6.5 Materials (material combinations) for furniture upholstery are tested for ignition resistance and flame spread.

2 STRUCTURAL FIRE PROTECTION

2.1 GENERAL REQUIREMENTS

2.1.1 Requirements for materials.

2.1.1.1 Except in cargo spaces, mail and baggage compartments and refrigerated provision storerooms of service spaces, insulating materials shall be non-combustible.

Vapour barriers and adhesives used in conjunction with insulation, as well as the insulation of pipe fittings, for cold service systems, need not be of non-combustible materials, but they shall be kept to the minimum quantity practicable and their exposed surfaces shall have low flame spread characteristics.

In spaces where petroleum products are likely to be present, the surface of insulation shall be impervious for them and their vapours.

2.1.1.2 Casings and crowns of machinery spaces of category A shall be of steel. Openings in such crowns and casings shall be arranged and protected so that to prevent the spread of fire.

Spaces for oil fuel purifiers and similar spaces specified in 4.2.7, Part VII "Machinery Installations" shall be restricted by steel bulkheads extending from deck to deck.

2.1.1.3 Where superstructures and deckhouses, as well as ships under 300 gross tonnage are constructed of aluminium alloys, the following requirements shall be complied with:

.1 the metallic core of load-bearing "A" or "B" class divisions made of aluminium alloy is to be so covered with an insulating material of sufficient thickness that the temperature of the structural core of the specimen does not rise more than 200°C above the initial temperature at any time during the applicable fire exposure to the standard fire test.

For ships of less than 300 gross tonnage the period of fire test of "A" class divisions may be 30 min instead of 1 hour;

.2 adequate measures are to be taken to ensure that for aluminium alloy components of columns, stanchions and other structural members required to support lifeboat and life raft stowage, launching and embarkation areas and "A" class divisions, the temperature rise limitation shall apply at the end of one hour and for such members required to support "B" class divisions, the temperature rise limitation shall apply at the end of half an hour;

.3 the use of combustible materials for the construction of structural details, grounds, supports, linings of bulkheads, furniture, etc. in superstructures and deckhouses constructed of aluminium alloy shall be limited.

Ceilings in corridors and spaces shall be constructed of non-combustible materials.

2.1.1.4 The mass of combustible materials used for the construction of partition bulkheads, grounds, supports, linings, finishes, furniture and other equipment of control stations, accommodation and domestic service spaces (other than saunas and refrigerated storerooms) where the use of such materials is not prohibited by this Part of the Rules, shall be not in excess of 45 kg per 1 m² of deck area in each space.

The Register may revise the standard indicated on the basis of the type and purpose of the ship.

2.1.1.5 The hull, superstructures, deckhouses, structural bulkheads and decks shall be constructed of steel or other equivalent material.

If aluminium alloys or glass-reinforced plastics are utilized, the requirements of 2.1.1.3 or 2.9 shall be met, respectively.

The Register may allow the use of other materials according to the purpose and the size of a ship.

2.1.1.6 Primary deck coverings, if applied within accommodation and service spaces and control stations, shall be of an approved material which will not readily ignite, or give rise to toxic or explosive hazards at elevated temperatures, this being determined in accordance with the Fire Test Procedures Code.

2.1.1.7 Paints, varnishes and other finishes used on exposed interior surfaces shall not give off excessive quantities of smoke and toxic vapours, this
being determined in accordance with the Fire Test Procedures Code.

In oil tankers and oil recovery vessels the use of aluminium paints in cargo oil tanks, cofferdams, pump rooms, in way of cargo tank decks and in other places where explosion-dangerous vapours can accumulate, is not permitted.

2.1.1.8 In control stations, accommodation and service spaces surfaces in concealed and inaccessible spaces (behind panellings, linings, etc.) including grounds, as well as exposed surfaces of ceilings must have low flame spread characteristics (see also 2.2.2.5 and 2.3.4).

2.1.1.9 Not readily ignitable bedding is recommended.

2.1.1.10 On cargo ships of 500 gross tonnage and upwards and on passenger ships where non-combustible bulkheads, linings and ceilings are fitted in accommodation and service spaces, they may have combustible veneer with caloric value not exceeding 45 MJ/m2 with regard for the thickness of materials used.

With regard for veneer thickness, the caloric value Q, in MJ/m2, is determined from the formula:

\[ Q = Q_0 \rho s, \]

where \( Q_0 \) is the high specific caloric value of the material, as determined in accordance with the ISO 1716 standard "Building Materials — Determination of Calorific Potential", MJ/kg;
\( \rho \) is the density of material, kg/m3;
\( s \) is the thickness of material, m.

The total volume of combustible facings, mouldings, decorations and veneers in any accommodation and service space bounded by non-combustible bulkheads, ceilings and linings shall not exceed a volume equivalent to a 2,5 mm veneer on the combined area of the walls and ceilings.

On cargo ships below 500 gross tonnage and non-self-propelled ships irrespective of their gross tonnage, the above requirement may be waived in favour of non-combustible bulkheads, linings and ceilings with a combustible veneer not more than 2 mm thick to be fitted in accommodation and service spaces except corridors and stairway enclosures, as well as control stations where the veneer thickness is not to exceed 1,5 mm.

2.1.1.11 All waste-paper receptacles shall be constructed of non-combustible materials with no openings in the sides and bottom.

2.1.2 Fire-resisting and fire-retarding divisions.

2.1.2.1 Fire-resisting or "A" class divisions are those divisions which are formed by bulkheads or decks complying with the following requirements:

.1 they shall be constructed of steel or other equivalent material;

.2 they shall be suitably stiffened;

.3 they shall be so constructed as to be capable of preventing the passage of smoke and flame up to the end of the 60-min standard fire test;

.4 they shall be so insulated with non-combustible material that the average temperature of the unexposed side will not rise more than 140°C above the original temperature, nor will the temperature, at any one point, including any joint, rise more than 180°C above the original temperature.

Depending on the time during which the above-indicated temperature rise is ensured in the course of the standard fire test, the following symbols are conferred to divisions: "A-60" - during 60 min.; "A-30" - during 30 min.; "A" - during 15 min.; "A-0" during 0 min.

2.1.2.2 In order to reduce heat transfer in places where the metallic cores of "A" class divisions other than "A-0" class divisions joint metal decks, bulkheads, sides and the framing of the hull, as well as where the metallic cores of "A" class divisions are pierced by pipes, cables, air ducts, etc. provision shall be made for insulation of abutting structures with non-combustible material on one or both sides for a total length of 500 mm from "A" class division. The insulation may be permitted to extend for lesser distance, if such reduction in the extent of insulation is proved by the standard fire test results.

2.1.2.3 "A" and "B" class bulkheads with an aluminum-alloy core should have insulation on both sides of the core if they are load-bearing or if they separate adjacent spaces each containing combustible medium. Non-load-bearing bulkheads may not be provided with insulation on the core on the side of the space containing no combustible medium. "A" class decks having an aluminum-alloy core are to be insulated from below.

2.1.2.4 Where in ships of less than 500 gross tonnage an "A" class division separates two adjacent spaces, one of which does not contain any combustible medium or it is an outer surface of a superstructure or a deckhouse, except for those referred to in 2.4.3, such a division may be "A-0" class division, if it is made of steel.

2.1.2.5 Fire-retarding or "B" class divisions are those divisions which are formed by bulkheads, decks, ceilings or linings which comply with the following requirements:

.1 they are fully made of non-combustible materials.

Use of combustible veneer is permitted (see 2.1.1.8 and 2.1.1.10 and for passenger ships, 2.2.2.8);

.2 divisions shall be so constructed as to remain capable of preventing the passage of flame up to the end of the 30-minute standard fire test;

.3 divisions shall have an insulation value such that the average temperature on the unexposed side during the fire test will not rise more than 140°C above the original temperature, nor will the temperature at any one point, including any joint, rise more than 225°C above the original temperature when either side is exposed to the fire test.
According to the time during which the above-mentioned temperature rise is ensured in the course of the standard fire test, the following symbols are conferred to divisions: "B-15" - during 15 min.; "B-0" - during 0 min.

2.1.2.6 Fire-resisting and fire-retarding divisions are tested according to the IMO Resolution A.517(13) "Recommendation for Fire Test Procedures for "A" and "B" Class Divisions".

2.1.2.7 Continuous "B" class ceilings and linings in association with the relevant decks or bulkheads, may be accepted as contributing wholly or in part, to the required insulation and integrity specified in the appropriate fire integrity tables.

2.1.2.8 All "B" class bulkheads shall extend from deck to deck and to the shell or other boundaries, unless continuous "B" class ceilings and/or linings are fitted on both sides of the bulkhead, in which case the bulkhead may terminate at the continuous ceiling or lining.

2.1.3 Closures of openings in fire-resisting and fire-retarding divisions.

2.1.3.1 Design of all doors and door frames in "A" class divisions with arrangements keeping them closed shall as far as practically possible ensure the same fire resistance and proof from smoke and fire like the divisions where they are installed. Such doors and door frames shall be made of steel or other equivalent material. Doors and door frames in "B" class divisions and fixing arrangements shall ensure the same fire resistance like the divisions where they are installed. Doors shall be incombustible.

All windows and scuttles in bulkheads within accommodation and service spaces shall be fitted so as to ensure that fire resistance of the bulkhead is not impaired.

This requirement is not applied to glass partitions, window and side scuttles in the outer boundaries of the ship and to exterior doors in superstructures and deckhouses except for passenger ships (see 2.2.4.4 and 2.2.4.5).

All windows and side scuttles in the outer bulkheads of accommodation spaces, service spaces and control stations shall meet the requirements of 7.2.2.4, Part III "Equipment, Arrangements and Outfit".

2.1.3.2 The doors designed in compliance with the requirements of 7.5.2 and 7.12, Part III "Equipment, Arrangements and Outfit" and fitted according to 7.12 of the above mentioned Part, and, in certain cases (e.g. for providing gastightness), if specially agreed with the Register, may be fitted in "A" class bulkheads. Such doors need not be insulated.

2.1.3.3 Doors in all fire-resisting bulkheads (self-closing and automatically closing doors included) shall be so arranged as to be capable of being opened manually from either side of the bulkhead by one person only.

2.1.3.4 Doors to machinery spaces of category A and stairway enclosures, other than power-operated watertight doors and those which are normally locked, should be of the self-closing type and should have no hold-back hooks. However, fail-safe hookback facilities are permitted which are provided with a remotely operated release device.

2.1.3.5 Ventilation openings and louvers in "A" class doors shall not be permitted.

2.1.3.6 Ventilation openings may be permitted in the lower portion or under "B" class doors, except for the doors in stairway enclosures.

The total next area of any such opening or openings shall not exceed 0,05 m². When such openings is cut in a door, it shall be fitted with a grill made of non-combustible material.

2.1.3.7 The upper portion of "B" class doors may be glazed for which purpose either specially manufactured fire-resistant or wire-reinforced glass shall be used. The glass panels shall be mounted in frames of steel or other non-combustible material. At all times only those glazed doors of "B" class shall be permitted the specimens of which comply with the requirements for "B" class divisions when exposed to the standard fire test.

Where doors fitted in large public spaces fail to comply with the requirements for "B" class divisions, owing to the excessively large area glazed, such doors may be permitted on agreement with the Register, on condition that water screens meeting the applicable requirements of 3.5 are provided.

2.1.3.8 The hinges of "A" and "B" class doors and parts of dogs and locks of "A" class doors are to be manufactured of materials with a melting point not below 950°C, and parts of dogs and locks of "B" class doors are to be made of materials having a melting point not below 845°C except where it has been proved by the tests that materials with a melting point below 845°C do not impair fire integrity of the doors.

2.1.3.9 Where "A" or "B" class divisions are penetrated by framing members, electric cables, pipes, trunks, ducts, etc. or are pierced for fitting of ventilation terminals, lighting fixtures and similar devices, arrangements shall be made to ensure that the fire resistance is not impaired.

2.1.4 Closure of doorways, access trunks and other openings.

2.1.4.1 Provision should be made to control the opening and closing of skylights, closing of exhaust ventilation openings in funnels, closing of ventilation flaps smoke release, closing of power-operated doors or actuating the release mechanism of doors that are not watertight and are power-operated, closing of
other openings in spaces protected by fire smothering systems. The controls are to be located outside the spaces in question or where they would not be isolated in case of fire.

On passenger ships, such controls are to be located in one place or in as few places as possible to which safe access from the weather deck is ensured.

2.1.4.2 No glass panels are to be fitted in machinery and pump rooms skylights.

Windows are not to be fitted in machinery room boundaries. This does not preclude the use of glass in control stations within the machinery rooms.

In case the fitting of glass in skylights is extremely necessary, these glasses, as well as glasses of side scuttles (windows) fitted in compliance with 19.2.4.5.2, Part XI "Electrical Equipment" shall be wire-reinforced.

The requirements of 7.7.5, Part III "Equipment, Arrangements and Outfit" are also to be met.

2.1.4.3 In accommodation and service spaces, as well as in control stations stairways and lift trunks shall be protected in the following way:

1 Stairways which penetrate only a single deck shall be protected at least at one level by at least "B-O" class divisions and self-closing doors. Lifts which penetrate only a single deck shall be surrounded by "A-O" class divisions with steel doors at both levels. Stairways and lift trunks which penetrate more than a single deck shall be surrounded by at least "A-O" class divisions and protected by self-closing doors at all levels. Stairway enclosures may be arranged so as to allow to go from one stair to a superimposed stair within such enclosure (Fig. 2.1.4.3.1-1), or to enclose the stairs only with doors at each end of the stair (Fig. 2.1.4.3.1-3), or to enclose the stairs only in combination with fully closed steel stairs and doors fitted at the end of each stair (Fig. 2.1.4.3.1-2);

2 on ships having accommodation for 12 persons or less, where stairways penetrate more than a single deck and where there are at least two escapes direct to the open deck at every accommodation level, stairways and lift trunks may be protected by "B-O" class divisions;
.3 Lift trunks design shall exclude penetration of smoke and fire from one tween deck to another;

.4 Insulation of passenger lift trunks within stairway enclosures is not compulsory. In this case, the doors in lift trunks need not be of fire-resisting type;

.5 Where a hold-back hook is fitted it is to comply with 2.1.3.4;

.6 The construction of stairways shall comply with the requirements of 8.5.4, Part III "Equipment, Arrangements and Outfit";

.7 On passenger ships stairways and lift trunks are to be protected as under 2.1.4.3.3 to 2.1.4.3.6 and 2.2.2.4.

2.1.4.4 Air spaces enclosed behind ceilings, panelings, or linings shall be divided by close-fitting draught stops spaced not more than 14 m apart.

In the vertical direction, such air spaces, including those behind linings or stairways, trunks, etc. are to be closed at each deck.

2.1.4.5 In machinery spaces from which two means of escape are provided in compliance with 4.5.3, Part VII "Machinery Installations", one of the ladder sets over the entire length of escape shall provide continuous fire shelter in the form of protecting these ladders by "A-15" class divisions or by "A-0" class divisions with drenching operated from the lower part of the space and from outside in the vicinity of the entrance (see item 15, Table 3.1.2.1). In the lower part of the shelter the door of a self-closing type complying with the requirements of 2.1.3.4 shall be provided.

2.1.4.6 In addition to watertight door separating the machinery space of category A from the shaft tunnel, from the side of the latter a light steel fire-screen door shall be fitted to be operated from each side.

2.1.4.7 Permanent openings in the side plating, the ends or deckhead of open and closed cargo spaces of ro-ro ships, as well as special category spaces shall be so situated that a fire in these spaces does not endanger stowage areas and embarkation stations for lifeboats and liferafts, accommodation spaces, service spaces and control stations in superstructures and deckhouses above the mentioned spaces.

2.1.5 Storerooms for readily flammable materials and substances, except hangars and garages.

2.1.5.1 Storerooms for readily flammable materials shall not be generally situated in common with accommodation spaces in superstructure or deckhouse. Access to the storerooms is to be provided from the open deck directly or through a corridor and/or a stairway leading only to these storerooms.

In ships of less than 300 gross tonnage storerooms may be arranged in way of the accommodation spaces, but not adjacent thereto.

2.1.5.2 Flammable liquids with a flash point below 43°C shall be kept in ventilated storerooms in metal tanks, each of which is to be provided with:

- fittings for sampling with self-closing valve;
- a measuring device of a closed type;
- a device for filling the tank from outside the storeroom;
- an air pipe led beyond the storeroom and complying with the requirements of 10.1.4, 10.1.6, 10.1.8, 10.1.9 and 10.1.11, Part VIII "Systems and Piping";
- a tray.

Where the amount of some flammable liquid does not exceed 35 l, it is permitted to store it in metal cans with tight-closing lids.

Where the total capacity of the tanks exceeds 250 l (but is not more than 2500 l), the storeroom shall be equipped with independent power exhaust ventilation to remove the air from the lower part of the space ensuring at least 20 air changes per hour. The supply ventilation may be natural. The operation of fans may be interlocked with opening of doors to the storeroom. Electrical equipment in the storeroom shall be flameproof as required in 2.9, Part XI "Electrical Equipment".

Where the quantity of flammable liquids exceeds 2500 l the tanks for their storage shall be arranged in compliance with 2.1.11.

2.1.5.3 In ships of less than 300 gross tonnage where provision of a separate storeroom for flammable liquids specified in 2.1.5.2 is impeded, it is permissible to keep such liquids in steel ventilated lockers or cases. The lockers or cases shall not be continuous to accommodation spaces. The doors of such lockers or cases shall open outside. The liquids shall be kept in metal cans with tight-closing lids of total capacity not more than 50 l.

2.1.6 Other storerooms.

2.1.6.1 It is recommended that means of escape from storerooms for combustible materials lead to the open deck or a corridor directly communicating with the open deck.

2.1.6.2 Spaces for storing cylinders referred to in 6.4.5.4, Part X "Boilers, Heat Exchangers and Pressure Vessels" are to have entrance from the open deck and are to be separated from adjacent spaces by "A-60" class divisions.

2.1.7 Storerooms for explosives (magazines).

2.1.7.1 In special purpose ships the arrangement of storerooms for explosives (magazines) may be permitted on condition that the requirements set forth in 2.1.7.2 to 2.1.7.22 are fulfilled. The magazines may be of the following categories:

- .1 integral magazines forming an integral part of the ship;
- .2 independent magazines that are non-integral, portable magazines with a capacity of 3 m$^3$ or greater;
- .3 magazine boxes that are non-integral, portable magazines with a capacity of less than 3 m$^3$. 
2.1.7.2 Integral magazines are to be located in the forward or after portion of the ship and be well removed from the propeller shaft, propeller and rudder (in any case as far off as one watertight space). They are not to be located below accommodation spaces, control stations, fuel tanks and be adjacent to them.

2.1.7.3 Integral magazines are not to be located adjacent to machinery spaces of category A, galleys or other spaces presenting a fire hazard. If it is necessary to construct the magazines in proximity to these areas, a cofferdam of at least 0.6 m is to be provided separating the two spaces. Such a cofferdam is not to be used for stowage and is to be provided with ventilation. One of the bulkheads forming the cofferdam is to be of "A-15" class unless there is adjacent machinery space of category A in which case "A-30" is appropriate.

2.1.7.4 Access to integral magazines is preferably to be from the open deck through a water-or gastight door, but in no case through spaces mentioned in 2.1.7.2 and 2.1.7.3.

2.1.7.5 Independent magazines and magazine boxes are to be located on an open deck in a location protected from direct impact of the sea. The location is to provide sufficient protection against warm air hazardous vapours being emitted from galleys, pump rooms, etc. Due regard is to be paid to the possible risk of subjecting certain explosives to radio emissions.

2.1.7.6 Magazine boxes are to be located on a weather deck at least 0.1 m from the deck and any deckhouse and in a position suitable for jettisoning the contents.

2.1.7.7 Bulkheads and decks bounding integral magazines are to be of steel watertight construction and of "A-15" class (see 2.1.2.4). Insulation is to be provided to prevent the condensation of moisture.

2.1.7.8 Piping of fresh or salt water and drainage systems and piping of systems installed in the magazines themselves may be routed through magazines. Piping of other systems are to be permitted only if they are enclosed in a watertight trunk.

2.1.7.9 Doors and lids of magazines are to be provided with locks.

2.1.7.10 Racks are to be installed, the construction and capacity of which are to provide safe stowage of explosives in their approved shipping containers and to prevent them from shifting and falling when the ship is rolling.

The upper rack is not to be located higher than 1.8 m above the deck. The racks are to have holes for water flowing from the upper to the lower racks during operation of the drenching system.

2.1.7.11 Decks of magazines are to be covered with a permanent nonslip, nonspark covering (for example, with mats or two layers of linoleum).

2.1.7.12 A free volume of the magazine, when loaded, is to be at least 70 per cent of the entire magazine volume. The volume of the space is to be not less than 1 m$^3$ for each 100 kg of explosives or 1000 detonators.

2.1.7.13 Integral magazines are to be provided with natural or mechanical ventilation fitted with flame screen sufficient to maintain the magazine temperature not higher than 38°C.

2.1.7.14 Independent magazines are to be provided with efficient natural ventilation fitted with flame screen.

2.1.7.15 Magazines are to be fitted with automatic heat detectors operating at temperatures rising above 40°C. An appropriate indicating unit is to be provided in the wheelhouse and in the chief mate's cabin.

2.1.7.16 Integral and portable magazines are to be fitted with drenching systems for racks in compliance with 3.6. The controls are to be clearly marked as to their function.

2.1.7.17 Scuppers are to be fitted in the magazine deck. The scupper pipes are to be provided with valves which are to be kept permanently closed under normal service conditions. The valves are to be controlled from outside the magazines.

2.1.7.18 A portable magazine is to bear a label indicating mass in light condition and maximum permissible mass of explosives.

2.1.7.19 Magazine boxes are to be of watertight metal construction having a body and lid thickness of not less than 3 mm. Where the box may be exposed to direct sun, sun shields are to be provided.

2.1.7.20 Integral and independent magazines are to be clearly labelled indicating:

1. the space is a magazine;
2. open lights and flame are to be kept away;
3. the magazine door is to be locked;
4. matches and lighters are to be removed prior to entering;
5. not to lift with contents (in the case of independent magazines).

2.1.7.21 Magazine boxes are to be clearly labelled indicating:

1. the container is a magazine box;
2. open lights and flame are to be kept away;
3. the box is to be locked.

2.1.7.22 Electrical equipment in magazines is to comply with the provisions of 19.4.3 and other requirements of Part XI "Electrical Equipment" as appropriate.

2.1.7.23 Detonators are to be stowed separately from other explosives.

2.1.7.24 Charging of cartridges and other preparatory operations for using explosives are to be made in charging rooms which are to be specially provided for that purpose. Charging rooms are to be
arranged in steel enclosures and located on the weather deck, well removed from control stations, accommodation and service spaces. Bulkheads, decks and equipment of the charging rooms are to be faced with nonsparking materials.

2.1.8 Spaces for electric and gas welding operations and for storage of cylinders.

2.1.8.1 Spaces for the storage of oxygen and acetylene cylinders shall be arranged, having regard to the following:

.1 oxygen and acetylene cylinders shall be stored in vertical position in special naturally ventilated closed spaces on the open deck;

.2 locations where cylinders are stored shall be fitted with stands having sockets, straps or other arrangements to ensure efficient securing and quick releasing of the cylinders;

.3 locations of the storage of cylinders shall be chosen so as to preclude mechanical damage to the cylinders. The cylinders shall be properly protected from the access of the unauthorized persons thereto. Sun shades painted in white shall be fitted in order to protect the cylinders from direct sunbeams. On the barrier around the cylinder storage there shall be provided warning plates: "Danger of explosion!" and "No smoking!". Fastening of cylinders to bulkheads of accommodation spaces shall not be permitted;

.4 locations for the storage of cylinders shall be located at a distance not less than 2 m from the accommodation spaces and control stations and not less than 4 m from the spaces where readily flammable substances or fuel oil are stored or where essential ship equipment is installed.

The storage space for acetylene cylinders shall be independent of the oxygen cylinder storage space. Such spaces shall have direct entrances from the open deck. The doors opening outside shall be fitted with locks. Danger warning inscriptions shall be provided on the doors of the spaces. These spaces shall be separated from adjacent spaces by "A-60" class divisions (see 2.1.2.4).

2.1.8.2 Spaces for electric and gas welding operations in ships shall be arranged, having regard to the following:

.1 the space shall have an exit to the open deck and be separated from adjacent spaces by "A-60" class divisions (2.1.2.4);

.2 the door shall be fitted with a lock.

2.1.8.3 In addition to fulfillment of the requirements of 2.1.8.2 the space for electric and gas welding operations in oil tankers shall meet the below-listed requirements:

.1 the space shall be located aft of cargo oil tanks, slop tanks and their cofferdams;

.2 the space shall not be located in machinery spaces of category A or less than 5 m to the spaces intended for storage and carriage of explosion- and fire-hazardous substances;

.3 the distance from the space to vents of cargo oil tanks and slop tanks shall be not less than 9 m;

.4 the space shall be provided with power ventilation ensuring not less than 20 air changes per hour;

.5 power source for welding operations shall be interlocked to prevent the possibility of its switching on with the entrance door open and the artificial ventilation disconnected;

.6 an illuminated board with inscription "Do not enter! Welding!" shall be provided near the entrance door.

2.1.9 Galley, bakeries and saunas.

2.1.9.1 The bulkheads and decks of galleys, bakeries and saunas are to be of steel.

2.1.9.2 Galleys and bakeries using sources of energy, other than electricity shall not be adjacent to storerooms for readily flammable and combustible materials or to fuel and lubricating oil storage spaces.

2.1.9.3 The decks of galleys and bakeries shall be covered with ceramic tiles or other equivalent covering of non-combustible materials.

2.1.9.4 Any galley serving 50 persons and more shall have at least two means of escape, except for electric galleys which may have only one.

2.1.9.5 The equipment of oil-, coal- and gas-fired galleys shall be constructed of non-combustible materials. Where so needed, wood (preferably hardwood) may be permitted for the equipment of galleys.

2.1.9.6 The smoke stacks of galleys and bakeries shall be insulated within the ship spaces with non-combustible materials.

2.1.9.7 If exhaust ventilation ducts from galley ranges and bakeries pass through accommodation spaces or spaces containing combustible materials, such ducts shall be made of "A-O" class divisions (see also 12.2.4 and 12.2.7, Part VIII "Systems and Piping")

2.1.9.8 In the case of oil-fired equipment it is permitted to use oil fuel with a flash point not less than 60°C.

The capacity of fuel service tanks located in galleys shall not exceed the daily consumption requirement.

A shut-off valve on the supply pipe shall be remotely controlled from readily accessible place outside the galley.

It is recommended that quick-closing type valves be used.

Tanks, fuel pumps and heaters shall be placed at least 2 m from the nearest point on the heating equipment, and at least at a 0,5 m distance from the same in the plan view of the space.

If the galley space is sufficiently large, it is recommended that the fuel tanks, pumps and other appliances of the fuel system should be placed in special enclosures.
All oil-fired equipment, burners included, shall be fitted with trays underneath (or an equivalent protection provided directly on the steel deck), with beads not less than 75 mm in height, extending not less than 100 mm outside the equipment perimeter.

2.1.9 If a deep fat cooking equipment is used on galleys, places of their location shall be fitted with the local fire extinguishing systems. Such systems may have automatic or manual start-up, clearly identified and accessible for the crew. Galley room shall be fitted with an audible fire extinguishing alarm. Galley deep fat cooking equipment shall be fitted with:
main and back-up thermostat with an audible alarm warning about its breakdown;
automatic de-energizing device when the fire extinguishing system is starting.

2.1.9.10 Sauna’s linings and doors may be made of wood. The heating element is to be electrical and is to meet the requirements of Section 15, Part XI "Electrical Equipment", and cables and wiring shall meet the requirements of 16.8 of that Part. The heating element is to be separated from bulkheads and decks by a screen of non-combustible materials.

2.1.10 Hangars for helicopters, helicopter decks.

2.1.10.1 A hangar shall be well removed from the spaces where large amounts of heat are produced; where practicable, it shall not be adjacent to accommodation, service, cargo and working spaces. If a hangar is adjacent to the above-mentioned spaces, the separating bulkheads (decks) shall be "A-60" class divisions.

2.1.10.2 The bulkheads and decks that enclose a hangar shall be constructed of steel.

2.1.10.3 All equipment, arrangements and machinery shall be so constructed and mounted as to preclude spark formation.

2.1.10.4 Helicopter decks and areas for refuelling shall be clearly marked and provided with coamings to prevent fuel from spreading beyond the limits of these areas.

2.1.10.5 Spaces below the helicopter deck shall be isolated from the deck by "A-60" class divisions (see 2.1.2.4).

Helicopter decks shall be of steel or other equivalent material. The Register may permit aluminium or other low-melting metal provided the following conditions are met:

1 if the platform is cantilevered over the side of the ship, after each fire on the ship or on the platform, the platform shall undergo a structural analysis to determine its suitability for further use;

2 if the platform is located above the ship’s deckhouse or similar structure, the following requirements shall be satisfied:

2.2 all windows under the platform shall be provided with steel shutters;

2.3 after each fire on the platform or in close proximity, the platform shall undergo a structural analysis to determine its suitability for further use.

2.1.10.6 "No smoking" signs shall be on decks and inside hangars.

2.1.10.7 The following fire fighting equipment shall be stored in two containers near the helicopter deck: 3 sets of fireman’s outfit in one container and a power saw with spare disk, cutting shears and 3 x 3 m blanket in another container. Close to containers a fire hook of not less than 3 m in length shall be kept.

2.1.10.8 The requirements of 3.2.6.2, 3.7.2.12, items 3.5, 4.15, 6.2, 6.4, 6.5, Table 5.1.2, 5.1.15, as well as general aircraft requirements for supporting aids of helicopter in ships shall be taken into account.

2.1.11 Storage of fuel with a flash point below 43°C. Fuel distribution stations.

2.1.11.1 Storage tanks for the fuel with a flash point below 43°C shall comply with the following requirements:

1 the tanks shall be placed within the hull as close as possible to the ship’s ends;

2 on all sides and corners, except for the ship side, below the light-ship waterline the tanks shall be surrounded by cofferdams meeting the requirements of 2.7.5.2, Part II "Hull" filled up with inert gas (see 3.9.11) under service conditions. The cross-section area of the air (ventilation) pipes shall comply with the requirements of 10.1.10 and 10.1.11, Part VIII "Systems and Piping". The cofferdams shall be fitted with a sounding pipe led to the upper open deck;

3 each fuel tank shall be provided with a filling, service, sounding and air pipe. The open end of the filling pipe shall not be placed higher than 300 mm above the tank bottom. The sounding pipe shall terminate at a distance of 30-50 mm from the tank bottom and shall be led out to the upper open deck.

It is recommended that a closed-type level indicators should be fitted instead of sounding pipes;

4 fuel tank air pipes shall terminate not less than 2.4 m above the open deck. The open ends of the pipes shall be located at a distance of at least 9 m from openings in deckhouses and superstructures and shall be fitted with flame-arresting wire gauzes or some other equivalent devices approved by the Register;

5 fuel, air and sounding pipes leading from fuel tanks to a distribution station shall be laid in a separate gastight steel trunk, sufficiently large to provide access for a man throughout the length of the trunk. The trunk walls shall be of "A-60" class divisions. Where

1 The present requirements cover the storage facilities for fuel not intended for the onboard machinery of ships other than oil tankers.
provision is made for filling the trunk with water or inert gas, the trunk may be made of "A-0" class divisions. In any case, the trunk shall be provided with supply and exhaust ventilation. The open ends of the ventilation pipes shall be fitted with flame-restricting gauges or other flame-restricting devices.

No other pipes or electric cables shall be laid through the trunks;

.6 in order to preclude the accumulation of static electricity, all fuel pipes, tanks, fittings and instruments associated with the storage and carriage of fuel shall be efficiently earthed to the ship’s hull.

2.1.11.2 Distribution stations of fuel with a flash point below 43°C to ships and helicopters shall comply with the following requirements:

.1 the stations shall be situated on the open decks and shall be as remote as practicable from accommodation spaces and areas containing a source of vapour ignition;

.2 the spaces of the stations shall be enclosed by "A-60" class bulkheads and decks (see 2.1.2.4), the doors may be of steel and have no insulation. All the boundary surfaces of such spaces shall be gastight;

.3 deck coverings shall preclude spark formation;

.4 the means of closing the doors leading into the station shall exclude the possibility of spark formation;

.5 a fuel distribution arrangement shall consist of a metering device to record the quantity of supplied fuel, a flexible hose with a nozzle provided with a self-closing valve;

.6 tanks for the fuel shall be made of a material excluding the possibility of spark formation;

.7 all outlet pipes shall be so fitted as to secure the gastightness of the bulkheads;

.8 provision shall be made for the arrangement whereby a fuel spillage may be collected and drained to a slop tank;

.9 warning notices forbidding smoking and use of a naked light shall be made on the door of the station.

2.1.11.3 Storage tanks for helicopter fuel (see also 2.1.11.1) are to comply with the following:

.1 fixed tanks may be installed on weather decks. In so doing, the tanks shall be protected against physical damage and from direct influence of the sunbeams. The tanks shall be installed in compliance with the requirements of 2.1.11.2.1.

Where such tanks are equipped with arrangements for their emergency jettisoning, measures shall be taken to prevent a jettisoned tank from striking the ship structures;

.2 storage tanks shall be provided with remotely controlled fuel shut-off devices;

.3 fuel storage in transported tanks is permitted at specially provided locations. Such tanks shall be efficiently secured, closed and bonded. The tanks shall be readily accessible for inspection;

.4 the tanks mentioned above shall be fitted up with devices for collecting of spillage and its discharge into the off-grade fuel tank;

.5 the fuel pump should be connected to one tank at a time only. The pipe connecting the tank to the pump is to be made of steel or equivalent material and should, as far as practicable, be short and protected from damage;

.6 warning notices forbidding smoking and use of a naked light shall be provided in places where the tanks are located.

2.1.12 Arrangement of fuel oil and lube oil tanks.

2.1.12.1 Arrangement of fuel oil and lube oil tanks is permitted in way of accommodation, service and refrigerated spaces provided they are isolated from those spaces with cofferdams. For cofferdam scantlings and design, see 2.7.5.2, Part II "Hull".

On arrangement with the Register and on condition special measures are taken, the above compartments and spaces may be isolated from the tanks without the use of cofferdams.

Cofferdam scuttles are not permitted in way of accommodation and service spaces.

2.1.13 Heating.

2.1.13.1 Electric heating shall be in compliance with the requirements of Section 15, Part XI "Electrical Equipment".

2.1.14.2 All radiators shall be so constructed and located as to preclude the danger of setting fire to the equipment and also to the clothes and baggage of the persons accommodated in the space concerned.

2.1.13.3 Steam and electric radiators shall be located at a distance of at least 50 mm from the ship’s sides or bulkheads. If the ship's sides or bulkheads are lined with a combustible material, the portions located against the heating elements shall be protected with heat insulation of non-combustible material. In the absence of such heat insulation the heating elements shall be located at a distance of not less than 150 mm from the combustible lining.

2.1.14.4 Liquefied gas system for domestic needs.

2.1.14.1 The use of gas meeting the requirements of current national standards is permitted.

2.1.14.2 Liquefied gas may be used for galley ranges, as also for straight-through liquid heaters (including provision refrigerators) consuming not more than 1 kg of liquefied gas per hour.

The use of liquefied gas system in passenger ships and oil tankers is subject to special consideration by the Register in each case.

2.1.14.3 Only standard gas containers and gas-consuming appliances of type approved by competent technical supervision bodies may be installed on board the ship.

2.1.14.4 An automatic safety gas cut-off device shall be fitted on gas-consuming appliances, which operates in the event of flame failure.
For straight-through heaters this device shall have check flame.

2.1.14.5 Gas containers shall be stowed in a special compartment on the open deck, complying with the requirements of 2.1.5.1 with direct access to the open deck.

Where provision is made for stowage of not more than two gas containers, they may be arranged in an enclosed recess in the superstructure or deckhouse, or in a steel locker.

Furthermore, the stowage compartment for gas containers shall meet the following requirements:

1. Efficient natural ventilation shall be provided, account being taken of the provisions of 12.1.4 and 12.4.6, Part VIII "Systems and Piping".

In addition to natural ventilation, mechanical ventilation may be used, the requirements of 12.1.4, Part VIII "Systems and Piping" being taken into consideration;

2. Where necessary, structural arrangements shall be made to prevent the temperature in the compartment from exceeding +50°C;

3. Electric illumination and electrical equipment at a distance of 2 m from openings to the compartment shall comply with the requirements of 2.9, Part XI "Electrical Equipment".

4. A warning notice recalling the risk of explosion and prohibiting the use of naked flame and smoking shall be displayed on the door.

2.1.14.6 The installation of gas containers in the compartment shall comply with the following requirements:

1. Cylinders shall be installed with stop valves upwards and be secured with quick-detachable arrangements.

Other measures shall be taken to quickly release containers;

2. A reducing valve shall generally be fitted on the container head; in this case, short rubber reinforced hose may be used for connection of the reducing valve to the liquefied gas pipeline;

3. If a group of containers is connected to the manifold, only one reducing valve shall be fitted between each container and the manifold; in this case, containers shall be connected to manifold by copper pipes;

4. Where more than one container is connected to the manifold, shut-off valve or cock shall be fitted between each container and the manifold. A notice prohibiting the simultaneous use of more than one container shall be displayed in the compartment.

2.1.14.7 Compartments containing gas-consuming appliances shall be equipped in compliance with 2.1.9 and meet the following requirements:

1. They shall not be arranged below the upper deck and be provided with efficient natural ventilation for extraction of combustion products and air taking from the lower part of the compartment;

2. Where the compartment is partially below the open deck, it shall be provided with mechanical ventilation;

3. Straight-through gas-consuming appliances shall be provided with separate lines for removal of combustion products.

2.1.14.8 Pipes shall be of seamless steel or copper. Steel pipes shall be protected against corrosion.

2.1.14.9 The thickness of pipe walls shall meet the requirements of column 2 or 8, Table 2.3.3, Part VIII "Systems and Piping".

2.1.14.10 Pipes from gas containers to gas-consuming appliances shall be laid over the open deck and be protected against mechanical damages.

2.1.14.11 Pipe joints shall be welded. Threaded or flange joints are permitted only in places of connection of instrumentation lines, gas-consuming appliances and fittings.

2.1.14.12 A shut-off valve or cock shall be fitted on the pipe where it pierces the bulkhead of the container compartment, this valve or cock being operated from outside the compartment. The valve or cock shall be provided with a turning limiter and a plug position indicator.

2.1.14.13 Where more than one gas-consuming appliance is installed, a shut-off valve or cock provided with a turning limiter and a plug position indicator shall be fitted on branches from a common pipe line to each gas-consuming appliance.

Where these valves or cocks are fitted in the container compartment, provision shall be made for their operation from outside the compartment; in this case, the installation of a cock or valve on the common pipe line may be omitted (see 2.1.14.12).

2.1.14.14 The reducing valve shall provide the pressure of not more than 5 kPa in the system.

2.1.14.15 The reducing valve or the pipe line after it shall be provided with a safety valve with a setting pressure less than 7 kPa with gas outlets piped to a safe place of the upper deck.

Where the reducing valve is so designed that gas outlet to a low pressure pipe line is closed in case of failure or break of the diaphragm, the safety valve need not be provided.

2.1.14.16 Fittings may be of bronze, brass or other corrosion-resisting material.

2.1.14.17 Liquefied gas pipe lines from containers to reducing valves shall be tested:

   in ship, by hydraulic pressure of 2.5 MPa;

   in ship, by air pressure of 1.7 MPa.

Pipe lines from reducing valves to gas-consuming appliances shall be tested by air pressure of 0.02 MPa after installation on board.
2.2 PASSENGER SHIPS

2.2.1 General requirements.

2.2.1.1 The requirements of this Chapter are additional to those set out in 2.1.1 to 2.1.6, 2.1.8 to 2.1.13 and 2.1.15.

2.2.1.2 For ships carrying more than 36 passengers, the hull, superstructure and deckhouses should be divided into main vertical zones by "A-60" class divisions. Steps and recesses should be kept to a minimum, but where they are necessary they are also to be "A-60" class divisions. Where a category 2.2.1.3 (5), 2.2.1.3 (9) or 2.2.1.3 (10) space is on one side of the division the standard may be reduced to "A-0".

For ships carrying not more than 36 passengers, the hull, superstructure and deckhouses in way of accommodation and service spaces should be divided into main vertical zones by "A" class divisions. These divisions should have insulation values in accordance with Tables 2.2.1.5-1 and 2.2.1.5-2.

As far as practicable, the bulkheads forming the boundaries of the main vertical zones above the bulkhead deck should be in line with watertight subdivision bulkheads situated immediately below the bulkhead deck. The length and width of main vertical zones may be extended to a maximum of 48 m in order to bring the ends of main vertical zones to coincide with subdivision watertight bulkheads or in order to accommodate a large public space extending for the whole length of the main vertical zone provided that the total area of the main vertical zone is not greater than 1600 m² on any deck.

Bulkheads forming the boundaries of main vertical zones should extend from deck to deck and to the shell or other boundaries.

Where the main vertical zone of ships carrying not more than 36 passengers is divided by horizontal "A" class divisions into horizontal zones for the purpose of providing an appropriate barrier between sprinklered and non-sprinklered zones of the ship, the divisions should extend between adjacent main vertical zone bulkheads and to the shell or exterior boundaries of the ship and should be insulated in accordance with the fire insulation classes given in Table 2.2.1.5-2.

On ships designed for special purposes, such as automobile or railroad car ferries, where the provision of main vertical zone bulkheads would defeat the purpose for which the ship is intended, equivalent means for controlling and limiting a fire, such as water screens, should be provided.

In ships with special category spaces, the provisions of 2.2.3 should be complied with.

2.2.1.3 The minimum fire integrity of all bulkheads and decks separating adjacent spaces in ships carrying 36 passengers and more is to be as prescribed in Tables 2.2.1.3-1 and 2.2.1.3-2.

For the purpose of determining the class of structures between adjacent spaces, such spaces are classified according to their fire risk as follows:

1) Control stations - in compliance with 1.5.1.

2) Stairways - interior stairways beyond the machinery spaces with enclosures thereto and trunks of lifts for passengers and crew.

A stairway which is enclosed at only one level shall be regarded as part of the space from which it is not separated by a fire door.

3) Corridors.

4) Evacuation stations and external escape routes; survival craft stowage area; open deck spaces and enclosed promenades forming lifeboat and liferaft embarkation and lowering stations; muster stations, internal and external; external stairs and open decks used for escape routes; the ship's side to the waterline in the lightest seagoing condition, superstructure and deckhouse sides situated below and adjacent to the liferaft's and evacuation slide's embarkation areas.

5) Open deck spaces - open deck spaces and enclosed promenades clear of lifeboat and liferaft embarkation and lowering stations.

6) Accommodation spaces of minor fire risk - cabins, offices, dispensaries and public spaces containing furniture and furnishings of restricted fire risk and having a deck area of less than 50 m² (See 1.2).

7) Accommodation spaces of mode-rate fire risk:

   - spaces containing furniture and furnishings of other than restricted fire risk;
   - public spaces as in category (6) but containing furniture and furnishings of restricted fire risk and having a deck area of 50 m² and greater;
   - isolated lockers and small storerooms in accommodation spaces having areas less than 4 m² (in which flammable liquids are not stowed), sales shops, motion picture projection and film rooms;
   - cleaning gear lockers;
   - laboratories (in which flammable liquids are not stowed);
   - small drying rooms (having a deck area of 4 m² or less);
   - diet kitchens (containing no open flame);
   - specie rooms.

8) Accommodation spaces of high fire risk:

   - public spaces containing furniture and furnishings of other than restricted fire risk and having a deck area of 50 m² and greater;
   - barber shops and beauty parlours.

9) Sanitary and similar spaces:

   - communal sanitary facilities, showers, baths, water closets, etc.;
   - small laundry rooms;
   - indoor swimming pool area;
isolated serving pantries containing no cooking appliances in accommodation spaces;
enclosed private sanitary facilities shall be considered a portion of the spaces in which they are located.

10) Tanks, voids and auxiliary machinery spaces
having little or no fire risk:
water tanks forming part of the ship’s structure;
voids and cofferdams;
avuxiliary machinery spaces which do not contain
machinery having a pressure lubrication system and
where storage of combustibles is prohibited, such as:
ventilation and air-conditioning rooms; windlass
room; steering gear room; stabilizer equipment room;
electrical propulsion motor room; rooms containing
section switchboards and purely electrical equipment;
shaft alleys and pipe tunnels; spaces for pumps and

</table>

1 If adjacent spaces marked with 1 have the same fire integrity, it is not necessary to divide such spaces with a bulkhead or deck. For instance for spaces of category (12) it is not necessary to divide a galley and buffets which are part thereof with bulkheads provided the bulkheads and buffet decks have the same fire resistance equal to that of structures bordering the galley. However, it is necessary to erect a bulkhead between the galley and engine room although both spaces have the same category (12)

2 The ship’s side, to the waterline in the lightest seagoing condition, superstructure and deckhouse sides situated below and adjacent to the liferafts and evacuation slides may be reduced to “A-30”.

3 Where public toilets are installed completely within the stairway enclosure, the public toilet bulkhead within the stairway enclosure can be of “B” class integrity.

4 Where spaces of categories (6), (7), (8) and (9) are located completely within the outer perimeter of the muster station, the bulkheads of these spaces are allowed to be of “B-O” class integrity. Control positions for audio, video and light installations may be considered as part of the muster station.

5 Where oil fuel tanks are located under a special category space, the integrity of the separating deck may be reduced to “A-O” class.

Notes: 1. In respect of category (5) spaces, it is subject to the special consideration of the Register whether the insulation values in Table 2.2.1.3-1 should apply to ends of deckhouses and superstructures, and whether the insulation values in Table 2.2.1.3-2 should apply to weather decks. In no case should the requirements of category (5) of Table 2.2.1.3-1 to 2.2.1.3-2 necessitate enclosure of spaces which in the opinion of the Register need not be enclosed.

2. Where, due to any particular structural arrangements in the ship, difficulty is experienced in determining from the tables the minimum fire integrity value of any divisions, such values are subject to the special consideration of the Register.

3. Where the contents and use of a space are such that there is a doubt as to its classification, it should be treated as a space within the relevant category having the most stringent boundary requirements.

4. Notwithstanding the provisions of 2.2.1.2 there are no special requirements for material or integrity of boundaries where only a dash appears in the tables.

1 See foot-note 1 to Table 2.2.1.3-1.
For Notes, see Table 2.2.1.3-1.

---

reduction machinery (not handling or using flammable liquids);

closed trunks serving the spaces listed above;

other closed trunks such as pipe and cable trunks.

11) Auxiliary machinery spaces, cargo spaces, cargo and other oil tanks and other similar spaces of moderate fire risk:

cargo oil tanks;

cargo holds, trunkways and hatchways;

refrigerated chambers;

oil fuel tanks (where installed in a separate space with no machinery);

shaft alleys and pipe tunnels allowing storage of combustibles;

auxiliary machinery spaces as in category (10) which contain machinery having a pressure lubrication system or where storage of combustibles is permitted;

oil fuel filling stations;

spaces containing turbine and reciprocating steam engine driven auxiliary generators and small internal combustion engines up to 110 kW driving generators, sprinkler, drencher or fire pumps, bilge pumps, etc.;

closed trunks serving the spaces listed above.

12) Machinery spaces and main galleys:

main propelling machinery rooms (other than electric propulsion motor rooms) and boiler rooms;

auxiliary machinery spaces other than those in categories (10) and (11) which contain internal combustion machinery or other oil-burning heating or pumping units;

main galleys and annexes;

trunks and casings to the spaces listed above.

13) Storerooms, workshops, pantries, etc.:

main pantries, not annexed to galleys;

main laundry, sauna;

large drying rooms (having a deck area of more than 4 m²);

miscellaneous stores;

mail and baggage rooms;
garbage rooms;
workshops (not part of machinery spaces, galleys, etc.);
lockers and storeroms having areas of more than 4 m² and not having provisions for the storage of flammable liquids.

14) Other spaces in which flammable liquids are stowed:
lamp rooms;
paint rooms;
storerooms containing flammable liquids (including dyes, medicines, etc.);
laboratories (in which flammable liquids are stowed).

2.2.1.4 On ships carrying not more than 36 passengers, where a space is protected by an automatic sprinkler system or fitted with a continuous "B" class ceiling, openings in decks not forming steps in main vertical zones or bounding horizontal zones should be closed reasonably tight and such decks should meet the "A" or "B" class integrity requirements subject to the special consideration of the Register.

2.2.1.5 The minimum fire integrity of all bulkheads and decks separating adjacent spaces in ships carrying not more than 36 passengers is to be as prescribed in Tables 2.2.1.5-1 and 2.2.1.5-2 with regard to the following:

1) for determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, such spaces are classified according to their fire risk as shown in categories (1) to (11) below:
   1) control stations as defined in 1.5.1;
   2) corridors and lobbies;
   3) accommodation spaces as defined in 1.5.2;
   4) interior stairways and lifts (other than those wholly contained within the machinery spaces) and enclosure thereto.

In this connexion, a stairway which is enclosed only at one level is to be regarded as part of the space from which it is not separated by a fire door;

5) service spaces (low risk);
storerooms for combustible materials not having provisions for the storage of flammable liquids and having areas less than 4 m², storerooms for non-combustible materials, drying rooms and laundries;

6) Machinery spaces of category A.
Spaces as defined in 1.2, Part VII "Machinery Installations";

7) Other machinery spaces. Machinery spaces excluding spaces referred to in (6) and special electrical spaces in compliance with 1.5.10;

8) Cargo spaces as defined in 1.5.4;

9) Service spaces (high risk) as defined in 1.5.3, excluding spaces referred to in (5);

10) open decks:
open deck spaces and enclosed promenades having no fire risk;
air spaces (the space outside superstructures and deckhouses).

11) Special category spaces as defined in 1.5.9.

2) the doors from the cabins to individual sanitary spaces may be of combustible materials.

2.2.1.6 In public spaces (including trade centres, restaurants, agencies, etc.) which contain free volumes extending to three or more decks and comprising combustible matter (such as furniture), provision should be made for an automatic sprinkler system and a smoke detection system with smoke detectors along the whole length of the main vertical fire zone.

The exits from the above spaces should be in compliance with the requirements of 8.4.2, Part III "Equipment, Arrangements and Outfit" and of 12.3, Part VIII "Systems and Piping".

2.2.2 Accommodation and service spaces within a main vertical zones.

2.2.2.1 For ships carrying more than 36 passengers all bulkheads which are not required to be "A" class divisions should be "B" class or "C" class divisions as prescribed in Table 2.2.1.3-1.

For ships carrying not more than 36 passengers all bulkheads within accommodation and service spaces which are not required to be "A" class divisions should be "B" class or "C" class divisions as prescribed in Table 2.2.1.5-1.

All such divisions may be faced with combustible materials in accordance with the provisions of 2.1.1.10.

2.2.2.2 For ships carrying not more than 36 passengers all corridor bulkheads where not required to be "A" class divisions should be "B" class divisions which should extend from deck to deck except:

1) when continuous "B" class ceilings or linings are fitted on both sides of the bulkhead, the portion of the bulkhead behind the continuous ceiling or lining should be of material which, in thickness and composition, is acceptable in the construction of "B" class divisions but which should be required to meet "B" class integrity standards only in so far as is reasonable and practicable in the opinion of the Register;

2) in the case of a ship protected by an automatic sprinkler system the corridor bulkheads of "B" class materials may terminate at a ceiling in the corridor provided such a ceiling is of material which, in thickness and composition, is acceptable in the construction of "B" class divisions. Notwithstanding the requirements of 2.2.1.5 such bulkheads and ceilings should be required to meet "B" class integrity standards only in so far as is reasonable and practicable in the opinion of the Register. All doors and frames in such bulkheads

\(^1\)Bulkheads separating the wheelhouse and chartroom from each other may be "B-O" rating.

\(^2\)"B-O" or "C" class bulkheads, where appearing in the table as main fire-proof divisions required by 2.2.1.2 shall be read as "A-O".

\(^3\)Where each of the adjacent spaces is protected by an automatic sprinkler system, the lower of the two values given in the tables may be used.

\(^4\)Where the spaces are used for the same purpose, no divisions may be fitted between them.

* Where an asterisk appears in the tables the division is required to be of steel or equivalent material, but is not required to be of "A" class standard.

</table>

1 See note 3 to Table 2.2.1.5-1
2 Where other machinery spaces of category (7) are the spaces of little fire risk, i.e. they do not contain machinery operating in fuel oil or having a pressure lubrication systems, "A-O" class divisions are permitted.

* For the application of 2.2.1.5.2 an asterisk, where appearing in Table 2.2.1.5-2, except for categories (8) and (10) is to be read as "A-O".
should be of non-combustible materials and should provide fire resistance to the satisfaction of the Register.

2.2.2.3 All bulkheads required to be "B" class divisions, except corridor bulkheads required by 2.2.2.2, should extend from deck to deck and to the shell or other boundaries unless the continuous "B" class ceilings or linings, having at least the same fire integrity as the bulkhead, are fitted on both sides of it, in which case the bulkhead may terminate at the continuous ceiling or lining.

2.2.2.4 Stairways in accommodation and service spaces shall be protected as follows:

1. stairways shall be enclosed in trunks formed by divisions specified in Tables 2.2.1.3-1 and 2.2.1.3-2 or 2.2.1.5-1 and 2.2.1.5-2;

2. a stairway connecting only two decks need not be enclosed, provided the integrity of the deck is maintained by bulkheads or doors in one "tween" space. Where a stairway is closed in one "tween" space, the stairway enclosure should be protected in accordance with the requirements of Tables 2.2.1.3-2 and 2.2.1.5-2;

3. stairways may be fitted in the open in a public space, provided they lie wholly within such public space;

4. stairway enclosures should have direct communications with the corridors and be of sufficient area to comply with 8.5.4.2, Part III "Equipment, Arrangements and Outfit". Within the perimeter of such stairway enclosures, only public toilets, lockers of non-combustible material providing storage for safety equipment and open information counters are permitted. Only public spaces, corridors, public toilets, special category spaces, other escape stairways required by Part III "Equipment, Arrangements and Outfit" and external areas are permitted to have direct access to these stairway enclosures;

5. one of the means of escape from a watertight compartment or a main fire vertical zone as required in 8.5.2.1, Part III "Equipment, Arrangements and Outfit" is to consist of enclosed stairways which provide a continuous shelter according to the requirements of 2.2.1.3 or 2.2.1.5.

6. if the stairway serves for the two main vertical zones then it shall be limited by the bulkheads and doors on the side of each zone as required for these zones.

2.2.2.5 In all spaces, except for refrigerating provision storerooms, cargo spaces, mail baggage cabins and saunas, the ceilings, bulkheads, linings, draught stops and grounds shall be made of non-combustible materials.

Partial bulkheads or decks used for the division of the space for practical or decorative reasons shall also be made of non-combustible materials.

In accommodation and service spaces, and in control stations, the open surfaces of corridors, stairway enclosures, as well as bulkheads and wall and ceiling cladding should have low flame spread characteristics.

2.2.2.6 In the case of ships fitted with an automatic sprinkler system, combustible materials used for erection of "C" class divisions may be added to the total volume of combustible materials mentioned in 2.1.1.10.

2.2.2.7 The construction of ceiling and bulkheads shall be such that it will be possible, without impairing the efficiency of the fire protection, for the fire patrols to detect any smoke originating in concealed and inaccessible places, except where there is no risk of fire originating in such places.

2.2.2.8 Furniture in stairway enclosures should be fixed, limited to six seats on each deck in each stairway enclosure, be of restricted fire risk, and should not restrict the passenger escape route. Additional seating in the main reception area within a stairway enclosure may be permitted if it is fixed, non-combustible and does not restrict the passenger escape route. Furniture should not be permitted in corridors forming escape routes in cabin areas.

2.2.3 Special category spaces.

2.2.3.1 When the above spaces cannot be protected by main vertical fire zones, their protection shall be ensured by subdivision into horizontal zones. These zones may cover more than one deck, but their overall height shall not exceed 10 m.

2.2.3.2 In ships carrying more than 36 passengers the boundary bulkheads and decks of special category spaces should be insulated to "A-60" class standard. However, where a category 2.2.1.3 (5), 2.2.1.3 (9) or 2.2.1.3 (10) space is on one side of the division the standard may be reduced to "A-0".

In ships carrying not more than 36 passengers the boundary bulkheads of special category spaces should be insulated as required for category (11) spaces in 2.2.1.5-1 and the horizontal boundaries as required for category (11) spaces in Table 2.2.1.5-2.

2.2.3.3 Indicators should be provided on the navigating bridge which should indicate when any fire door leading to or from the special category spaces is closed.

2.2.3.4 Special category spaces shall have means of escape leading to the lifeboat and liferaft embarkation places complying with the requirements of 8.5.1, 8.5.2.3, Part III "Equipment, Arrangements and Outfit" as well as the requirements of 2.1.4.7 and 2.2.2.4.1 of this Part.

Escape routes from the machinery spaces where the crew is normally employed shall avoid direct access to any special category space.

2.2.4 Doors, windows and sidescuttles.

2.2.4.1 Doors to machinery spaces of category A shall satisfy the requirements of 2.1.3.4 with regard to 2.2.4.1.1.

Fire doors in main vertical bulkheads, galley boundaries and stairway enclosures other than power-operated watertight doors and those which are normally locked, shall satisfy the following requirements:
.1 the doors shall be self-closing and be capable of closing with an angle of inclination of up to 3.5° opposing closure;

.2 the approximate time of closure for hinged fire doors shall be no more than 40 s and no less than 10 s from the beginning of their movement with the ship in the upright position. The approximate uniform rate of closure for sliding fire doors shall be no more than 0.2 m/s and no less than 0.1 m/s from the beginning of their movement with the ship in the upright position;

.3 the doors shall be capable of remote release from the continuously manned central control station, either simultaneously or in groups and shall be capable of release also individually from a position at both sides of the door. Release switches shall have an on-off function to prevent automatic resetting of the system;

.4 hold-back hooks not subject to central control station release are prohibited;

.5 a door closed remotely from the central control station shall be capable of being re-opened at both sides of the door by local control. After such local opening, the door shall automatically close again;

.6 indication shall be provided at the fire door indicator panel in the continuously manned central control station whether each of the remote-released doors is closed;

.7 the release mechanism shall be so designed that the door will automatically close in case of disruption of the control system or main power source;

.8 local power accumulators for power-operated doors shall be provided in the immediate vicinity of the doors to enable the doors to be operated after disruption of the control system or main source of electrical power at least ten times (fully opened and closed) using the local controls;

.9 disruption of the control system or main source of electrical power of one door shall not impair the safe functioning of other doors;

.10 remote-released sliding or power-operated doors shall be equipped with an alarm that sounds for at least 5 s but no more than 10 s after the door is released from the central control station and before the door begins to move and continues sounding until the door is completely closed;

.11 a door designed to re-open upon contacting an object in its path shall re-open not more than 1 m far from the point of contact;

.12 double-leaf doors equipped with a latch necessary to their fire integrity shall have a latch that is automatically activated by the operation of the doors when released by the control system;

.13 doors giving direct access to special category spaces which are power-operated and automatically closed need not be equipped with the alarms and remote-release mechanisms required in 2.4.4.1.3 and 2.4.4.1.10 above;

.14 the components of the local control system shall be accessible for maintenance and adjusting; and

.15 power-operated doors shall be provided with a control system of an approved type which shall be able to operate in case of fire, this being determined in accordance with the Fire Test Procedures Code. This system shall satisfy the following requirements:

the control system shall be able to operate the door at the temperature of at least 200°C for at least 60 min, served by the power supply;

the power supply for all other doors not subject to fire shall not be impaired; and

at temperatures exceeding 200°C the control system shall be automatically isolated from the power supply and shall be capable of keeping the door closed up to at least 945°C.

2.2.4.2 All "A" class doors located in stairways, public spaces and main vertical zone bulkheads in escape routes should be equipped with a self-closing hose port of material, construction and fire resistance which is equivalent to the door into which it is fitted, and should be a 150 cm square clear opening with the door closed and should be inset into the lower edge of the door, opposite the door hinges, or in the case of sliding doors, nearest the opening.

2.2.4.3 Cabin doors in "B" class divisions should be of a self-closing type. Hold-backs are not permitted.

2.2.4.4 Windows facing life-saving appliances, embarkation and muster areas, external stairs and open decks used for escape routes, and windows situated below lifeboat and escape slide embarkation areas should have the fire integrity as required in Tables 2.2.1.3-1 and 2.2.3.1-2. Where automatic dedicated sprinkler heads are provided for windows, "A-O" windows may be accepted as equivalent. Windows located in the ship's side below the lifeboat embarkation areas should have the fire integrity at least equal to "A-0" class.

2.2.4.5 The requirements for "A" class integrity of the outer boundaries of a ship shall not apply to exterior doors, except for those in superstructures and deckhouses facing life-saving appliances, embarkation and external muster station areas, external stairs and open decks used for escape routes. Stairway enclosure doors need not meet this requirement.

2.2.5 Closed and open ro-ro cargo spaces other than special category spaces.

2.2.5.1 These requirements are additional to those set forth in 2.1.4.7, 2.2.1.4, 2.2.3.1 and 2.2.4.1.

2.2.5.2 In passenger ships carrying more than 36 passengers, the boundary bulkheads and decks of closed and open ro-ro cargo spaces shall be insulated to "A-60" class standard. However, where a category (5), (9) or (10) space in accordance with the requirements of Tables 2.2.1.3-1 and 2.2.1.3-2 is on one side of the division, the standard may be reduced to "A-O". Where fuel oil tanks are below a ro-ro cargo space, the integrity of the deck between such spaces may be reduced to "A-O" standard.

2.2.5.3 In passenger ships carrying not more than 36 passengers, the boundary bulkheads and decks of
closed and open ro-ro cargo spaces shall have a fire integrity as required for category (8) spaces in Table 2.2.1.5-1 and the horizontal boundaries as required for category (8) spaces in Table 2.2.1.5-2.

2.2.5.4 Closed ro-ro cargo spaces.
Closed ro-ro cargo spaces shall comply with the requirements for cargo spaces intended for the carriage of motor vehicles with fuel in their tanks for their own propulsion.

2.2.5.5 Open ro-ro cargo spaces.
Open ro-ro cargo spaces shall be fitted with a pressure water-spraying system for manual operation (see 3.4) and shall comply with the requirements of 4.2.1.2 (except that a sample extraction smoke detection system is not permitted) and 4.14 of Table 5.1.2.

2.3 CARGO SHIPS

2.3.1 The requirements of this Chapter are additional to those set out in 2.1 and apply to cargo ships of 500 gross tonnage and upwards.

2.3.2 In accommodation and service spaces one of the following methods of protection shall be adopted:
Method IC: the construction of all internal divisional bulkheading of non-combustible "B" or "C" class divisions; or
Method IIC: the fitting of an automatic sprinkler and fire alarm system for the detection and extinction of fire in all spaces in which fire might be expected to originate, generally with no restriction on the type of internal divisional bulkheading; or
Method IIC: the fitting of an automatic fire detection and alarm system in all spaces in which a fire might be expected to originate, generally with no restriction on the type of internal divisional bulkheading, except that in no case must the area of any accommodation space or spaces bounded by "A" or "B" class division exceed 50 m².

Consideration may be given by the Register to increasing this area for public spaces.

2.3.3 The minimum fire integrity of the bulkheads and decks separating adjacent spaces is to be as prescribed in Tables 2.3.3-1 and 2.3.3-2.

For determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, the spaces are classified according to their fire risk as follows:
1) control stations in accordance with 1.5.1;
2) corridors and lobbies;
3) accommodation spaces in accordance with 1.5.2;
4) interior stairways and lifts (other than those wholly contained within the machinery spaces) and enclosures thereto.
A stairway which is enclosed only at one level shall be regarded as part of the space from which it is not separated by a fire door;
5) service spaces (low risk):
combustible material storerooms having areas less than 4 m², non-combustible material storerooms, drying rooms, laundries, and working spaces in compliance with 1.5.8.2;
6) machinery spaces of category A.
   Spaces as defined in 1.2, Part VII "Machinery Installations";
7) other machinery spaces.
   Machinery spaces excluding those specified in (6) and special electrical spaces in compliance with 1.5.10;
8) cargo spaces in compliance with 1.5.4;
9) service spaces (high risk) in compliance with 1.5.3, excluding those specified in (5), as well as working spaces in compliance with 1.5.8.1;
10) open decks.
Open deck spaces and enclosed promenades containing no fire risk. Air spaces (the space outside superstructures and deckhouses);
11) ro-ro cargo spaces as defined in 1.5.4.3.

2.3.4 Linings, ceilings, draught stops and their associated grounds should be made of non-combustible materials: in accommodation and service spaces, and in control stations, if protection method IC is used; in corridors and stairway enclosures serving accommodation and service spaces, and control stations, if protection methods IIC and IIIIC are used. All the open surfaces of corridors and stairway enclosures shall have low flame spread characteristics.

2.3.5 In accommodation and service spaces bulkheads not required to be "A" or "B" class divisions shall be:
.1 at least "C" class division in Method IC fire protection;
.2 not subject to any restrictions, except in cases where class "C" bulkheads are required in accordance with Table 2.3.3-1 in Method IIC fire protection;
.3 not subject to any restrictions except that in no case must the area of any accommodation space or spaces bounded by "A" or "B" class division exceed 50 m² (except in cases where "C" bulkheads are required in accordance with Table 2.3.3-1).

Consideration may be given by the Register to increasing this area for public spaces.

2.4 OIL TANKERS

2.4.1 The requirements of this Chapter are additional to those set out in 2.1 and 2.3 (except for 2.3.3) when only method IC fire protection is adopted and apply to oil tankers and combination carriers of 500 gross tonnage and upwards.

2.4.2 The minimum fire integrity of bulkheads and decks separating adjacent spaces is to be as prescribed in Tables 2.4.2-1 and 2.4.2-2 with regard to the following.

<sup>1</sup> Bulkheads separating the wheelhouse, chartroom and radio room from each other may be "B-O" rating.
<sup>2</sup> For clarification as to which applies, see 2.1.4.3.
<sup>3</sup> Doors separating cabins from individual sanitary accommodation may be constructed of combustible materials in Method IC fire protection. No special requirements are imposed upon bulkheads in Method IIC and IIC.
<sup>4</sup> In case of Method IIC bulkheads of "B-O" rating shall be provided between spaces or groups of spaces of 50 m² and over in area.
<sup>5</sup> For cargo spaces intended for carriage of dangerous goods see 2.8.10.
<sup>6</sup> "A-0" rating may be used if no dangerous goods are intended to be carried.
<sup>7</sup> Where spaces are used for the same purpose, divisions between them need not be fitted.
<sup>8</sup> Openings in bulkheads and decks shall be closed reasonably gastight.

*Where an asterisk appears in the tables the division is required to be of steel or equivalent but is not required to be of "A" class standard.

</table>

1 See note 3 to Table 2.4.2-1.
2 See note 4 to Table 2.4.2-1.
3 Where other machinery spaces of category (7) are the spaces of little fire risk, i.e. they do not contain machinery operating on fuel oil or having a pressure lubrication systems, "A-O" class divisions are permitted.
4 Where an asterisk appears in the tables the division is required to be of steel or other equivalent material but is not required to be of "A" class standard.
For determining the appropriate fire integrity standards to be applied to divisions between adjacent spaces, the spaces are classified according to their fire risk as follows:

1) control stations as defined in 1.5.1;
2) corridors and lobbies;
3) accommodation spaces as defined in 1.5.2;
4) interior stairways and lifts (other than those wholly contained within the machinery spaces) and enclosure.

A stairway which is enclosed only at one level is to be regarded as part of the space from which it is separated by a fire door;
5) service spaces (low risk):
   Combustible material storerooms having areas less than 4 m² and not having provisions for the storage of flammable liquids, non-combustible material storerooms, drying rooms and laundries;
6) machinery spaces of category A;
   Spaces as defined in 1.2, Part VII "Machinery Installations".
7) other machinery spaces;
   Machinery spaces excluding spaces referred to in (6) and special electrical spaces in compliance with 1.5.10.
8) cargo pump rooms as defined in 1.5.7;
9) service spaces (high risk) as defined in 1.5.3 excluding those specified in (5), as well as cargo control stations.
10) open decks.

Open deck spaces and enclosed promenades having no fire risk. Air spaces (the space outside superstructures and deckhouses).

2.4.3 Exterior boundaries of superstructures and deckhouses enclosing accommodation and including any overhanging decks which support such accommodation, shall be constructed of steel and insulated to "A-60" standard for the whole of the portions which face the cargo area and on the outward sides for a distance of 3 m from the end boundary facing the cargo area.

On a length of 3 m, the adjacent side structures at a height of three tiers from the weather deck shall be insulated in the same way.

2.4.4 In the outer structures of superstructures and deckhouses facing the cargo tanks and the fore and aft cargo gear, and to the extent of 4% of the ship length, but not less than 3 m (this distance need not exceed 5 m) in the adjacent side structures, the windows and side scuttles should be of the fixed (non-opening) type as required in 7.2, Part III "Equipment, Arrangements and Outfit". Such windows and side-scuttles shall be constructed to "A-60" standard.

This requirement does not apply to wheelhouse windows which may be of the opening type so long as they are designed to ensure that the wheelhouse can be made rapidly and efficiently gas and vapour tight.

2.4.5 Doors are not to be fitted in the bulkheads referred to in 2.4.4.

In these boundaries doors may be fitted leading to cargo control stations, provision rooms and storerooms not having access to accommodation and service spaces and control stations.

Where such doors are fitted, the structures enclosing cargo control stations and storerooms shall be insulated to "A-60" standard (see 2.1.2.4).

These requirements are not to apply to navigating bridge doors which are to be so designed that rapid and efficient gas and vapour tightening of the navigating bridge can be ensured.

In the bulkheads referred to in 2.4.4 bolt plates for removal of machinery may be fitted in such boundaries.

2.4.6 The Register may permit a navigation position to be fitted above the cargo area where this is for navigation purposes only, and it shall be separated from the cargo tank deck by means of an open space with a height of at least 2 metres. The fire protection of such a navigation position shall be as required for control stations in para 2.4.2 and other provisions, as applicable, of this part.

Where the main control station is on the forecastle deck or in the forward part of the ship equipped with a fore cargo gear, an emergency exit shall be provided to ensure safe escape in case of fire.

2.4.7 Machinery spaces are to be positioned aft of cargo tanks and slop tanks; they shall also be situated aft of pump rooms and cofferdams, but not necessarily aft of the oil fuel tanks. Any machinery space shall be isolated from cargo tanks and slop tanks by cofferdams, pump rooms, oil fuel tanks, or ballast tanks.

Pump rooms containing pumps and their accessories for ballasting those spaces situated adjacent to cargo tanks and slop tanks, and pumps for oil fuel transfer may be used for isolation of machinery spaces from cargo tanks and slop tanks provided that such pump rooms have the same safety standard as that required for cargo pump rooms.

The lower portion of the pump room bulkhead may be recessed into machinery spaces of category A to accommodate pumps. The deck head of the recess is not more than one third of the moulded depth above the keel. In ships of not more than 25000 tons deadweight, for reasons of access and satisfactory piping arrangements and on agreement with the Register, the deck head of the recess may be at a level of up to one half of the moulded depth above the keel.

A cargo tank or a slop tank adjoining machinery spaces by a corner shall be isolated therefrom by a corner cofferdam.

The design and dimensions of cofferdams shall comply with the requirements of 2.7.5.2, Part II "Hull."
Corner cofferdams inaccessible for inspection shall be fitted with suitable media.

2.4.8 Pump rooms shall be closed in by gastight bulkheads. Permanent approved gastight lighting enclosures may be installed in bulkheads and decks separating pump rooms from other spaces. These enclosures are intended for lighting of pump rooms provided that they are sufficiently durable and that fire resistance and fire-tightness of the bulkhead or deck is preserved.

The divisions separating pump rooms from machinery spaces of category A may be pierced for penetration of cargo pump shafts, electric cables, etc., provided suitable glands of approved type are fitted in places of penetration thereof.

The pump rooms should be provided with arrangements for continuous monitoring of hydrocarbon vapour concentration. Sampling or measuring points should be located at places where oil leakage is likely to occur, in the exhaust air ducts, in the lower part of pump room above the flooring.

When hydrocarbon vapour concentration reaches 30 per cent and more of the lower explosive limit audible and visual alarm should operate in the cargo control station and in the wheel house.

2.4.9 Control stations, cargo control stations, accommodation and service spaces (except for isolated cargo handling gear lockers) are to be positioned aft of all cargo tanks, slop tanks and spaces isolating cargo or slop tanks from machinery spaces, but not necessarily aft of the oil fuel tanks and ballast tanks, and are to be arranged in such a way that a single failure to a deck or bulkhead shall not permit the entry of gas or fumes from the cargo tanks into such spaces. The recess provided in accordance with 2.4.7 may be disregarded when determining the location of said spaces.

Enclosed smoking rooms shall be provided within the accommodation area. These spaces shall be formed by "B-15" Class divisions, and facings shall be made of materials having low flame spread characteristics.

2.4.10 Where deemed necessary and on agreement with the Register, control stations, cargo control stations, accommodation and service spaces may be positioned forward of the cargo tanks, slop tanks and spaces which isolate cargo tanks and slop tanks from machinery spaces but not necessarily forward of oil fuel tanks or ballast tanks. Machinery spaces other than category A may be per-mitted forward of the cargo tanks and slop tanks provided they are isolated from the cargo tanks and slop tanks by cofferdams, pump rooms, oil fuel tanks or ballast tanks.

All of the above-mentioned spaces shall be subject to an equivalent standard of safety and appropriate availability of fire-extinguishing arrangements. Control stations, cargo control stations, accommodation and service spaces shall be arranged in such a way that a single failure of a deck or a bulkhead shall not permit the entry of gas or fumes from the cargo tanks into such spaces. In addition, where deemed necessary for the safety of navigation of the ship, machinery spaces containing internal combustion engines not being main propulsion machinery having output greater than 375 kW may be located forward of the cargo area.

2.4.11 No access holes to oil fuel tanks located in the double bottom below cargo tanks are permitted in cargo tanks and in the machinery space.

2.4.12 On the upper deck at a distance of 2 m from the forward bulkhead of the superstructure where accommodation and service spaces are located, a continuous coaming shall be provided not less than 150 mm high extending from side to side.

Where an aft cargo gear is installed, such coaming shall be fitted on the side of the after bulkhead of the superstructure as well.

2.4.13 Manholes, openings for cleaning cargo tanks and other openings shall not be arranged in completely enclosed or in semiclosed spaces.

2.4.14 Deck openings for the ropes supporting the repair suspension sites shall comply with the following requirements:

.1 the number and arrangement of the openings are subject to special consideration by the Register. These openings shall be easily accessible for inspection and maintenance.

Deck holes shall be so tapped as to achieve a smooth transition on the upper and lower surfaces of the deck plate;

.2 closures for openings shall be metal thread plugs. Metal plugs shall have the fine thread with the sufficient number of threads in the joint;

.3 plugs and threaded joints shall be manufactured of material resistant to sea atmosphere and any cargoes carried in the ship;

.4 spare plugs shall be provided in any ship in the number not less than 10 per cent of the total number of openings;

.5 special tool shall be used to make the torque moment necessary for tightening the plugs and to set the efficient tightness;

.6 as for the tightness to cargo, the closures shall comply with the requirements of 7.11.3, Part III "Equipment, Arrangements and Outfit".

2.4.15 The following requirements are to be also met in combination carriers:

.1 the slop tanks are to be surrounded by cofferdams, except where the boundaries of the slop tanks are the hull, main cargo deck, cargo pump roombulkhead or oil fuel bunker tank. These cofferdams are not to be open to a double bottom, pipe tunnel, pump room or other enclosed space, as well as they shall not be used for carriage of cargo or
ballast and they need not be connected with cargo or ballast systems.

Means are to be provided for filling the cofferdams with water and draining them.

Where the boundary of the slop tank is the cargo pump room bulkhead, the pump room is not to be open to the double bottom, pipe tunnel or other enclosed space. However, openings provided with gastight bolted covers may be permitted;

.2 hatches and tank cleaning openings to slop tanks are to be only permitted on the open deck; they are to be fitted with closing arrangements, except where they consist of bolted plates with bolts at watertight spacing. These closing arrangements are to prevent them from being opened by an unauthorized person;

.3 an approved fixed gas warning system capable of monitoring flammable vapours is to be provided in cargo pump rooms, pipe ducts and cofferdams adjacent to slop tanks, referred to in 2.4.7.

Suitable arrangements are to be made to facilitate measurement of flammable vapours in all other spaces within the cargo tank area. Such measurements are to be made possible from open deck or easily accessible positions;

.4 arrangement of openings for cargo handling operations in decks and bulkheads separating the spaces for the carriage of oil and oil products from the spaces not intended or fitted for their carriage is permitted only provided equivalent tightness for oil products and their vapours is ensured;

.5 detailed instructions are to be exhibited on board, covering safety measures to be taken during loading or unloading of the ship and when dry cargoes are carried with oil product residues in the slop tanks.

2.5 SHIPS SERVING OIL TANKERS

2.5.1 The requirements of this Chapter are additional to those set forth in 2.1 and apply to oil lighters and harbour vessels serving oil tankers carrying flammable liquids.

2.5.2 Rubbing strakes shall be made of, or faced with, materials precluding spark formation.

Rubbing strakes shall not be fastened to the shell plating by means of through bolts.

2.5.3 The use of strake fenders with the outside surface formed by steel ropes is not permitted.

2.6 SPECIAL PURPOSE SHIPS

2.6.1 The requirements of this Chapter are additional to those set forth in 2.1.

2.6.2 For ships carrying not more than 50 persons of special personnel the fire protection requirements for cargo ships more than 500 gross tonnage are to be applied.

2.6.3 For ships carrying more than 50, but not more than 200 persons of special personnel the fire protection requirements for passenger ships carrying not more than 36 passengers are to be applied.

2.6.4 For ships carrying more than 200 persons of special personnel the fire protection requirements for passenger ships carrying more than 36 passengers are to be applied.

2.6.5 The minimal fire integrity of bulkheads and decks dividing the working spaces (see 1.5.8) of ships mentioned in 2.6.2 and 2.6.3 is to be in conformity with the requirements of 2.3.3 where service spaces of categories (5) and (9) respectively are concerned, and for ships mentioned in 2.6.4 it is to be in conformity with the requirements of 2.2.1.3 for spaces of categories (10) and (14) respectively.

2.7 OIL TANKERS (≥60°C)

2.7.1 The requirements of this Chapter are additional to the requirements of 2.1 and 2.3 and apply to ships of 500 gross tonnage and upwards.

2.7.2 Cargo tanks shall not be adjacent to accommodation spaces.

2.7.3 No doors leading to accommodation spaces shall be permitted in the front bulkhead of superstructures and deckhouses.

2.7.4 A continuous coaming not less than 150 mm high extending from side to side shall be fitted on the upper deck at a distance of about 2 m from a superstructure where accommodation and service spaces are arranged.

2.7.5 Machinery spaces of category A shall be arranged aft beyond cargo and slop tank area.

2.7.6 Where cargo heating arrangements are fitted, provision is to be made to prevent cargo from heating up to the temperature by 15°C less than the flash temperature.

2.8 SHIPS CARRYING DANGEROUS GOODS

2.8.1 The requirements of this Chapter are additional to those set forth in 2.1, 2.2, 2.3, 2.6, 3.1.2.1 and apply to the following types of ships and cargo spaces:

.1 ships and cargo spaces not specially designed for the carriage of freight containers but intended for the

---

1 The requirements of this Chapter are based on the International Maritime Dangerous Goods Code (A.316(17), as amended), and Code of Safe Practice for Solid Bulk Cargoes, adopted by resolution A.434(XI), as amended.
carriage of dangerous goods in packed form including goods in freight containers and portable tanks;
  .2 purpose-built container ships and cargo spaces intended for the carriage of dangerous goods in freight containers and portable tanks;
  .3 ro-ro ships and ro-ro cargo spaces intended for the carriage of dangerous goods;
  .4 ships and cargo spaces intended for the carriage of solid dangerous goods in bulk;
  .5 ships and cargo spaces intended for the carriage of dangerous goods other than liquids and gases in bulk in shipborne barges.

Cargo ships of less than 500 gross tonnage shall comply with these requirements; however, these requirements may be reduced, and such reduced requirements shall be recorded in the ship documents referring to carriage of dangerous goods.

2.8.2 Depending on the modes of carriage of dangerous goods the requirements of Table 2.8.2-1 shall apply; depending on the class of dangerous goods the requirements of Table 2.8.2-2 shall apply; depending on the class of dangerous goods other than those carried in bulk the requirements of Table 2.8.2-3 shall apply.

2.8.3 The water fire main system is to comply with the following additional requirements:
  .1 to ensure immediate availability of water supply at the required pressure either by permanent pressurization in the fire main or by suitably placed remote arrangements for the fire pumps from the locations referred to in 3.2.3.9;
  .2 to ensure the supply of the quantity of water to four nozzles with applicators provided on board under the pressure as specified in 3.2.1.1 to any part of the cargo spaces;
  .3 to effectively cool a cargo space by a pressure water-spraying system with a rate of water supply specified in 3.4.2.1 or by flooding the cargo space with water (see 3.6.4).

Hoses capable to ensure the delivery of the required quantity of water may be used for this purpose in small cargo spaces.

In any event the drainage and pumping arrangements shall be such as to prevent the build-up of free surfaces. If this is not provided, a calculation is to be made to prove that the ship with the cargo space flooded with water complies with the requirements of Sections 2 and 3, Part V "Subdivision";
  .4 in lieu of the compliance with the requirements of 2.8.3.3 cargo space may be flooded with high expansion foam as specified in 3.7.3, using a supply rate and time of continuous supply according to Table 3.7.1.3 for machinery and other spaces except for spaces intended for the carriage of dangerous cargoes reacting with water.

2.8.4 Electrical equipment shall comply with the requirements of 2.9.3, 2.9.9, 2.9.10, 2.9.12, 16.8.1.6, 16.8.4.5 and 16.8.6.1, Part XI "Electrical Equipment".

Any other equipment which may constitute a source of ignition of flammable vapours shall not be permitted.

2.8.5 Ro-ro cargo spaces shall be fitted with a fixed fire detection and fire alarm system complying with the requirements of 4.2.1. All other types of cargo spaces shall be fitted with either a fixed fire detection and fire alarm system complying with the requirements of 4.2.1 or a sample extraction smoke detection system complying with the requirements of 4.2.1.6. If a sample extraction smoke detection system is fitted, measures are to be taken to prevent penetration of the contaminated air in case of the gas leakage into the spaces where the equipment is installed. A notice plate indicating that the samples are discharged into the atmosphere shall be installed in such spaces.

2.8.6 Ventilation of cargo spaces shall comply with the following requirements of Part VIII, "Systems and Piping":
  .1 arrangement of the ventilation system, with the requirements of 12.17, 12.18, 12.7.1, 12.7.3 and 12.7.5;
  .2 construction of ventilation fans, with the requirements of 12.7.4;
  .3 at least natural ventilation system in compliance with the requirements of 12.7.2 shall be provided in enclosed ro-ro spaces intended for the carriage of solid dangerous goods in bulk.

2.8.7 The bilge system shall comply with the requirements of 7.14.1, Part VIII "Systems and Piping".

2.8.8 Ships shall be provided with the following personnel protection outfit (in addition to the fireman’s outfits required by item 10, Table 5.1.2):
  .1 four sets of full protective clothing resistant to chemical exposure and intended for use in emergency situations. Subject to cargo characteristics the protective clothing shall meet the International Marine Dangerous Goods Code (volume "SUPPLEMENT", section "EMERGENCY PROCEDURES") or the Code of Safe Practice for Solid Bulk Cargoes (Appendix E);
  .2 at least two self-contained breathing apparatuses.

2.8.9 Portable fire extinguishers with a total capacity of at least 12 kg of dry powder or equivalent shall be provided for the cargo spaces. These extinguishers shall be in addition to any portable fire extinguishers required elsewhere in this Part of the Rules.

2.8.10 Bulkheads forming boundaries between cargo spaces and machinery spaces of category A shall be insulated to "A-60" standard, unless dangerous goods are stowed at least 3 m horizontally away from such bulkheads. Other boundaries between such spaces shall be insulated to "A-60" standard.

When a cargo room is partially located above the engine room of category A and bounding structures

1 This requirement is not applicable to carriage of dangerous goods of classes 4 and 5.1 in closed freight containers. For classes 2, 3, 6.1 and 8 when carried in closed freight containers the ventilation rate may be reduced to not less than two air changes. For the purpose of this requirement a portable tank is a closed freight container.
2 Applies only to closed cargo spaces as given in 1.5.4.3.1, not capable of being sealed.
3 Applies only to closed cargo spaces as given in 1.5.4.3.1, not capable of being sealed.
4 In special cases where the barges are capable of containing flammable vapours or alternatively if they are capable of discharging flammable vapours to a safe space outside the barge carrier compartment by means of ventilation ducts connected to the barges, these requirements may be reduced or waived, which is subject to special consideration by the Register.

Note: Wherever + appears in the table, it means that this requirement is applicable to all classes of dangerous goods as given in the appropriate line of Table 2.8.2-3, except as indicated in the foot-notes.

1 The hazards of substances in this class which may be carried in bulk are such that special consideration must be given to the construction and equipment of the ship involved in addition to meeting the requirements of this table.
2 Only applicable to oilcake containing solvent extractions, ammonium nitrate and ammonium nitrate fertilizers.
3 Only applicable to ammonium nitrate and ammonium nitrate fertilizers. However, the degree of protection in accordance with the standards contained in the International Electrotechnical Commission, publication 79 — Electrical Apparatus for Explosive Gas Atmospheres, is sufficient.
4 Only suitable wire mesh guards are required.
5 The requirements of Code of Safe Practice for Solid Bulk Cargoes adopted by resolution A.434 (XI), as amended, are sufficient.

Don’t have required insulation, such cargo room is unfit for carriage of dangerous cargoes. The same refers to areas of bare open deck located above the engine room of category A.

2.8.11 Each open ro-ro cargo space having a deck above it and each space deemed to be a closed ro-ro space not capable of being sealed shall be fitted with an approved fixed pressure water-spraying system for manual operation which shall protect all parts of any deck and vehicle platform in such space. However, the Register may permit the use of any other fixed fire-extinguishing system that has been shown by full-scale test to be not less effective (see 1.3.3). In any case the drainage and pumping arrangements shall be

</table>

1 When "mechanically-ventilated" spaces are required by the International Maritime Dangerous Goods Code (resolution A.716(17), as amended).
2 Stow 3 m horizontally away from the machinery space boundaries in all cases.
3 Refer to the International Maritime Dangerous Goods Code.
4 As appropriate to the goods being carried.
such as to prevent the build-up of free surfaces. If this is not possible the adverse effect upon stability of the added weight and free surface of water shall be taken into account to the extent deemed necessary by the Register in its approval of the stability information.\(^1\)

2.8.12 In ships having ro-ro cargo spaces, separation shall be provided between a closed ro-ro cargo space and an adjacent open ro-ro cargo space. The separation shall be such as to minimize the passage of dangerous vapours and liquids between such spaces. Alternatively, such separation need not be provided if the ro-ro cargo space is considered to be a closed cargo space over its entire length and shall fully comply with the relevant special requirements of this Chapter.

2.8.13 In ships having ro-ro cargo spaces, separation shall be provided between a closed ro-ro cargo space and the adjacent weather deck. The separation shall be such as to minimize the passage of dangerous vapours and liquids between such spaces. Alternatively, such separation need not be provided if the arrangements of the closed ro-ro spaces are in accordance with those required for the dangerous goods carried on the adjacent weather deck.

2.8.14 Cargo spaces in ships other than ro-ro ships shall not be adjacent to accommodation and service spaces, except service spaces with low fire risk referred to in 1.5.3.2.4.

2.8.15 Hatch covers of dry-cargo holds shall comply with the requirements of 7.10.8.6, Part III "Equipment, Arrangements and Outfit".

2.9 SHIPS OF GLASS-REINFORCED PLASTIC

2.9.1 The requirements of the present Chapter apply to the ships whose hull and superstructures have been manufactured of structural glass-reinforced plastic having low flame spread characteristics. The requirements set forth in 2.1.1 to 2.1.6, 2.1.9 (except for 2.1.9.1), 2.1.12 and 2.1.13 shall be fulfilled to the extent which is reasonable for the glass-reinforced plastic ships.

2.9.2 In passenger ships and special purpose ships the following decks and bulkheads shall be constructed as "A-30" class division with the difference that their core is made of glass-reinforced plastic and the standard fire test may last 30 min instead of 1 hour:

1. bulkheads and decks separating machinery spaces of category A from adjacent spaces;
2. bulkheads and decks separating control stations from adjacent spaces containing a combustible medium;
3. crowns of machinery spaces;
4. side shell plating in way of machinery spaces from the level 200 mm below the waterline to the crown of the machinery spaces;
5. bulkheads and decks separating spaces referred to in 1.5.3.1.1, 1.5.3.2.2 and 1.5.3.2.3 from adjacent spaces containing a combustible medium;
6. bulkheads and decks in way of stowage of lifeboats and liferafts.

2.9.3 In other ships divisions referred to in 2.9.2 shall be constructed as "A-15" class divisions with the difference that their core is to be made of glass reinforced plastic and the standard fire test may last 30 min instead of 1 hour.

2.9.4 Insulation of divisions referred to in 2.9.2 and 2.9.3 shall be such that the temperature of the glass-reinforced plastic core by the end of a half an hour (see 2.9.2) and 15 min (see 2.9.3) standard fire test, respectively, does not exceed the level at which the glass-reinforced plastic strength is reduced to 50 per cent of the original value.

2.9.5 Insulating materials, grounds, supports, linings of bulkheads and ceilings shall be made of non-combustible materials. Bulkheads, linings of sides and ceilings may be faced with combustible materials having low flame spread characteristics and being not more than 1.5 mm in thickness.

2.9.6 Desks, wardrobes and similar furniture, as also frames of other furniture shall be made of non-combustible materials. Such furniture may be faced with combustible materials of not more than 1.5 mm in thickness.

2.9.7 Bulkheads of corridors in accommodation and service spaces shall be of "B-15" class.

2.9.8 The requirements set forth in 12.2.4 and 13.7.4, Part VIII "Systems and Piping" and the requirements of Part XVI "Hull Structure and Strength of Glass-Reinforced Plastic Ship and Boats" shall also be taken into account.

2.10 SHIPS FOR CARRIAGE OF MOTOR VEHICLES WITH FUEL IN THEIR TANKS FOR THEIR OWN PROPULSION

2.10.1 The requirements of this Chapter are additional to those set forth in 2.1 and 2.3 and apply to cargo spaces in which motor vehicles with fuel in their tanks are carried.

The requirements are framed on the understanding that motor vehicles are efficiently secured to preclude their displacement during the voyage, the quantity of fuel in tanks does not exceed the value established by competent bodies and no dangerous cargoes are carried in the same space where motor vehicles are transported.

Where motor vehicles are to be carried together with dangerous goods, the requirements of 2.8 are to be met.

\(^1\)Refer to Recommendation on fixed fire-extinguishing systems for special category spaces adopted by IMO by resolution A.123(V).
2.10.2 Entrances to cargo spaces from accommodation machinery and special electrical spaces are to be fitted with permanently closed self-closing doors. The height of door sills shall be not less than 450 mm.

2.10.3 There shall be provided notices at the entrances to cargo spaces, prohibiting smoking.

2.10.4 Cargo spaces shall meet the requirements of 4.2.1, 4.2.2.2, 4.14, Tables 5.1.2 and 5.1.14.3 of this Part, as well as of 7.6, Part VIII "Systems and Piping", 19.3, Part XI "Electrical Equipment".

2.11 OIL RECOVERY SHIPS

2.11.1 The requirements of this Chapter are additional to those stated in 2.1 and apply to oil recovery ships.

For ships of less than 500 gross tonnage the Register can assume deviations from the requirements of the present Chapter.

The requirements of the present Chapter are fully applicable to ships which will be eligible for class notation "oil recovery ships" and the descriptive note "suitable for operation in waters covered by oil" appended thereto.

For a ship whose class notation contains only "oil recovery ship" the requirements of 2.1.1.7, 2.1.1.2, 2.11.5 to 2.11.8, 2.11.10.1, 2.11.16, 2.11.17, 2.11.18, 2.11.20 and item 8, Table 3.1.2.1 are applicable. If cargo tanks of this ship are aft of the superstructure situated not less than 10 m from the nearest explosion dangerous zone its fire protection may comply with the requirements of 2.1.1.7, 2.3, 2.4.9, 2.4.10, 2.4.12, 2.4.17, 2.11.12, 2.11.6, 2.11.7, 2.11.8, 2.11.16, 2.11.17 and item 8, Table 3.1.2.1.

2.11.2 The hull, superstructures, deckhouses and decks shall be manufactured of steel.

The use of aluminium alloys for this purpose is not permitted.

2.11.3 In all ship's spaces the insulating materials shall be of a non-combustible type.

2.11.4 The mass of combustible materials used for the purposes specified in 2.1.1.4 shall not exceed 30 kg per 1 m² deck area of control stations, accommodations and service spaces.

2.11.5 To apply structural fire protection, suitable requirements specified in 2.4.2 to 2.4.5, 2.4.7 to 2.4.9 shall be complied with.

2.11.6 Fire integrity decks and bulkheads of the enclosed spaces intended for removable equipment used for oil products recovery shall comply with the requirements of 2.4.2 (Tables 2.4.2-1 and 2.4.2-2 as applicable to the spaces of category (9)).

2.11.7 The spaces intended for electrical and gas welding works shall be safe for operation (see 4.2.9, Part VII "Machinery Installations").

2.11.8 In addition to the requirements of 2.4.7, the spaces intended for removable equipment which is applicable for oil recovery shall be used as cofferdams.

On agreement with the Register, for ships of restricted area of navigation the cofferdams need not be provided between the machinery spaces of Category A and cargo tankers on condition that the bulkhead is constructed from the solid plate, access for inspection is ensured and hydraulic tests are carried out during each special survey.

2.11.9 The ship shall be provided with the water drenching system for drenching of superstructure outside walls according to 3.6 with the rate of water discharge 10 l/min/m and with the foam fire extinguishing system of cargo tanks having regard for the requirements of 3.1.3 and 3.7.

2.11.10 The water fire main system shall comply with the following additional requirements:

1. it shall be applicable to the oil tankers in compliance with the requirements of 3.2.5.4;
2. to supply water by fire pumps only from the bottom sea valve;
3. to provide remote control of fire pumps and water drenching system of superstructure outside walls from the navigating bridge.

2.11.11 The remote control of supply of an extinguishing medium into machinery spaces shall be provided from the navigating bridge; in this case, fire fighting station need not be provided with direct access to the open deck.

2.11.12 The control of supply of an extinguishing medium need not be provided with time delay arrangement mentioned in 4.3.3.

2.11.13 The high expansion foam system shall not be used for protection of machinery spaces.

2.11.14 If steam smothing system is used in ships of less than 2000 gross tonnage the amount of carbon dioxide for machinery spaces shall be calculated according to 3.8.1.1 where factor shall be equal to 0.35 and 0.4 respectively.

2.11.15 The enclosed spaces for removable equipment used for oil products recovery shall be protected by means of fire extinguishing system according to item 6 of Table 3.1.2.1.

2.11.16 For small multi-purpose ships (up to 1000 tons deadweight) periodically engaged in recovery of oil products at the sea surface, the fixed automatic system for atmosphere monitoring may be replaced, on agreement with the Register, by a periodic duty monitoring system with portable analyzers specified in 15.1 of Table 5.1.2.

Atmosphere monitoring shall be applied during the whole period of stay of the ship within the oil spot in locations specified in 2.11.17.

2.11.17 Sampling arrangements or detectors of the atmosphere monitoring system shall be located as follows:
.1 near the forced ventilation openings;
.2 at least at two locations at a height not more than 1 m above the open deck;
.3 in machinery space of category A;
.4 in air locks;
.5 in cofferdams of cargo tanks.

2.11.18 Fire fighting outfit, spares and tools shall be prescribed in the quantities provided for oil tankers; in this case, only a self-contained breathing apparatus may be included in the fireman's outfit.

2.11.19 For protection of working area of the deck two dry power fire extinguishers shall be installed with the mass of dry power being 45 kg each.

2.11.20 Fixed or portable instruments for determining the ignition temperature of oil products shall be provided in the ship.

2.11.21 The requirements of 9.4, 11.1.9 and 12.13, Part VIII "Systems and Piping" and those of 19.2, Part XI "Electrical Equipment" shall be taken into account.

2.12 BERTH-CONNECTED SHIPS

2.12.1 The requirements of the Chapter supplement those of 2.1 to 2.3.

2.12.2 Floating hostels accommodating more than 200 persons and floating hotels.

2.12.2.1 The fire protection of floating hostels accommodating more than 200 persons and of floating hotels is to be similar to that of passenger ships carrying not more than 36 passengers.

2.12.2.2 When applying Tables 2.2.1.5-1 and 2.2.1.5-2, the following should be considered:
.1 instead of the term "special category spaces" the term "sanitary spaces" should be used. Sanitary spaces should be separated from adjacent spaces by "A-0" class bulkheads except for adjacent spaces of categories (2) and (5) where "B-0" class bulkheads may be fitted and of categories (3) and (11) where "C" class bulkheads may be fitted. The decks separating sanitary spaces from adjacent spaces are to be "A-0" class except for spaces of categories (3), (10), (11) lying below and spaces of categories (3), (5), (10), (11) lying above where decks of steel or another equivalent material are permitted which may not be "A" class decks;
.2 the space in which the emergency power source or parts thereof are contained should be separated from an adjacent space containing the generating plant or part thereof by "A-60" class divisions.

2.12.2.3 The water fire main system must comply with the requirements for the water fire main system of passenger ships irrespective of gross tonnage and considering the following:

.1 at least two permanent fire pumps should be provided, independently driven and each having a separate sea valve, which are to be so arranged that a fire in any one space will not put both pumps out of action. No emergency fire pump may be provided.

With great suction lift, water may be taken by the pumps from tanks in which sea water is stored and which are filled by other pumps;
.2 one of the pumps should be intended for fire fighting purposes only;
.3 total output of the pumps need not exceed 180 m³/h.

2.12.3 Floating hostels accommodating 200 persons or less.

2.12.3.1 The fire protection of floating hostels accommodating 200 persons or less as well as of floating workshops, floating power plants and floating warehouses is to be similar to that of cargo ships of more than 500 gross tonnage.

2.12.3.2 When applying Tables 2.3.3-1 and 2.3.3-2, the following should be considered:
.1 instead of the term "ro-ro cargo spaces" the term "sanitary spaces" should be used. Sanitary spaces should be separated from adjacent spaces by "A-0" class bulkheads except for adjacent spaces of categories (2) and (5) where "B-0" class bulkheads may be fitted and of categories (3) and (11) where "C" class bulkheads may be fitted.

The decks separating sanitary spaces from adjacent spaces are to be "A-0" class except for spaces of categories (3), (10), (11) lying below and spaces of categories (3), (5), (10), (11) lying above where decks of steel or another equivalent material are permitted which may not be "A" class decks;
.2 the space in which the emergency power source or parts thereof are contained should be separated from adjacent spaces in conformity with 2.12.2.2.

2.12.3.3 The water fire main system must comply with the requirements of 2.12.2.3. On agreement with the Register, a water fire main system with one of the pumps started remotely may be permitted in accordance with 3.2.3.9.

2.12.4 Floating docks, electric power plants, workshops and warehouses.

2.13 SHIPS HAVING A DISTINGUISHING MARK OF PROVISION WITH MEANS FOR FIRE FIGHTING ABOARD OTHER SHIPS

2.13.1 The requirements of this Chapter are additional to those contained in 2.1 and 2.3.

2.13.2 Hull, superstructures, deckhouses and decks shall be made of steel.

2.13.3 Whatever method of fire protection of accommodation and service spaces is used, the requirements of 2.3.4 apply to these ships.
2.13.4 Ships shall be provided with a fire and rescue operations control station. The control station shall be placed so that the ship structures do not impair, as far as practicable, the vision of the water area around the ship.

2.13.5 The ships shall have:

special systems and equipment, the minimum number of which is indicated in Tables 2.13.5-1 and 2.13.5-2;

¹ The smaller value is for ships referred to in 2.13.10.2. ² A necessity in installation and characterizations to be indicated by the Customer in accordance with the requirements of 2.13.11.² ³ For ships referred to in 2.13.12.1.

Items of fire fighting outfit in compliance with 2.13.13.1;

additional bilge arrangements (systems) in accordance with 7.1.10 and 13.7.7, Part VIII "Systems and Piping";

additional internal service communications in compliance with 7.2.2, Part XI "Electrical Equipment".

2.13.6 Special systems installed on board ships for fire fighting on other objects and for their own protection (water-screen, drenching, water fire main, foam fire-extinguishing, dry powder systems) shall also comply with the requirements of Section 3 of this Part and Sections 2, 4, 5, Part VIII "Systems and Piping".

Where special systems other than specified in this Section of the Rules are installed for fire fighting on other objects, they shall comply with the requirements of the Rules to the extent agreed upon with the Register in each particular case.

2.13.7 The equipment of special systems (pumps, fittings, monitors) may be remote-controlled from the fire and rescue operations control station.

Air-operated and hydraulic control systems shall be supplied from two independent sources of power.

Electrically driven items shall comply with the requirements of 5.1 — 5.3, Part XI "Electrical Equipment".

2.13.8 Water-screen system.

2.13.8.1 In ships having distinguishing marks P11B, P12B or P13B in the class notation vertical hull surfaces, including superstructures and deckhouses, shall be protected with the water-screen system.

The water-screen system shall totally cover the ship and not impede visibility from the wheelhouse, fire and rescue operations control stations and hand monitor platforms.

2.13.8.2 Doors and side scuttles of ships having distinguishing marks P1, P2 in the class notation, which are not fitted with the above system, shall comply with the requirements of 7.2.1.10, Part III "Equipment, Arrangements and Outfit".

2.13.8.3 The capacity of the pumps serving the system shall be sufficient to supply water at a rate indicated in 3.5.

2.13.8.4 Where the system is subdivided into sections by shut-off valves manual operation shall be provided from the place of their installation in spite of the provision of the remote control.

2.13.8.5 The water-screen system shall protect the hand monitor platforms; the system is to be put into operation directly at each monitor.

2.13.8.6 The ship may be fitted with the water-screen system in combination with the drenching system or one of these two systems provided they are capable to ensure adequate protection of the ship. In any case the letter "B" shall be retained in the class notation.

2.13.9 Drenching system.

2.13.9.1 The drenching system in ships having distinguishing marks P11B, P12B or P13B in the class notation shall protect vertical surfaces of the hull, superstructures and deckhouses as well as horizontal surfaces where it is appropriate with regard to 2.13.8.6.

2.13.9.2 The rate of water discharge to the protected surface shall be at least 10 litres/min for 1 m of the tier length.

Depending on fire risk of ship spaces the rate of water discharge onto their outer surfaces may be reduced to 5 litres/min for 1 m of the tier length.

2.13.9.3 For protection of superstructures and deckhouses the sections of the system shall be
arranged on each tier; the arrangement of spray nozzles shall ensure uniform discharge of water onto the protected outer surface.

Where the system is subdivided into the sections, the requirement of 2.13.8.4 shall be met.

2.13.10 Special water fire-extinguishing system.

2.13.10.1 The system is generally intended for water supply to water monitors, distribution valve manifolds, as well as for supply of water-screen and drenching systems. The system may be used for pumping out the water from compartments of the ship in distress (see 7.1.10, Part VIII "Systems and Piping").

The requirements for installation of pumps, laying of pipes, water intake arrangements, fittings and tests shall comply with the provisions of this Part and of Part VIII "Systems and Piping" as far as reasonable and practicable with regard to the requirements given below.

2.13.10.2 The special water fire-extinguishing system in ships having distinguishing marks Π1, Π1B, Π2 or Π2B in the class notation shall be independent.

In ships having distinguishing mark Π3B in the class notation the ship water fire main system may be used as part of the special water fire-extinguishing system.

2.13.10.3 Availability of remote starting and control of the system shall not prevent starting of the pumps, control of monitors and fittings from the place of their installation (see Section 5, Part XI "Electrical Equipment").

Remote-controlled fittings shall have devices for their opening/closing during the time which allows to prevent water hammers.

2.13.10.4 Provision is to be made for operation of the pumps without overheating in case of no or small supply of water to consumers.

2.13.10.5 The number of monitors shall be not less than that indicated in Table 2.13.5-2 and their arrangement is to:

- provide supply of water from each monitor to both sides of the ship;
- prevent water from being discharged to the ship's own deck and its equipment;
- provide the water jet range in accordance with Table 2.13.5-2.

2.13.10.6 Each monitor shall have an independent connection to the main of the system.

2.13.10.7 Distribution valve manifolds shall be arranged on the upper deck and be capable of being turned. The number of the valves on the manifold is to be specified by the designer upon agreement with the Customer.

2.13.10.8 The capacity of the pumps is to be calculated so that water can be simultaneously delivered to monitors, the number of which is to comply with Table 2.13.5-2 depending on the distinguishing mark in the class notation.

2.13.11 Special foam fire-extinguishing system.

2.13.11.1 The special foam fire-extinguishing system shall be provided on ships which have distinguishing marks of provision with means for fire fighting aboard other ships.

The system may use totally or partly the equipment of the special water system (pumps, pipes, monitors). The number and type of the equipment of the foam fire-extinguishing system shall be specified by the designer on agreement with the Customer.

2.13.11.2 Ships with distinguishing marks Π2, Π2B or Π3 in the class notation may have the system fitted with air-foam monitors, foam generators or combination foam units; foam monitors may be omitted.

2.13.11.3 Ships with distinguishing marks Π1 or Π1B in the class notation shall be fitted with foam monitors or foam nozzles for monitors of the special water fire system. The number of foam monitors is to be not less than that indicated in Table 2.13.5-2; the requirements for their installation shall be in line with those for monitors of the special water fire-extinguishing system.

2.13.11.4 The reserve of foam concentrate is to be calculated on the basis of the operating time of a specified number of foam generators or one monitor during at least 30 minutes.

2.13.11.5 The type of the foam concentrate shall be chosen with regard to:

- water salinity in the ship service area prescribed;
- class of liquids, materials or goods the concentrate is intended to extinguish (oil and petroleum products, alcohols, ketones, aldehydes, etc.).

2.13.12 Special dry powder system.

2.13.12.1 The system shall be generally installed on ships servicing the operation area of gas carriers and chemical tankers.

2.13.12.2 Applicable requirements of 3.10 also cover the special dry powder system.

2.13.12.3 The system shall be provided with at least one hand monitor with a capacity not less than 40 kg/s.

The monitor shall be placed on a special platform fitted with devices for remote starting of the system (see 2.13.8.5).

2.13.12.4 The quantity of the extinguishing powder shall be specified by the designer on agreement with the Customer.

2.13.13 Fire outfit.

2.13.13.1 In addition to the fire fighting outfit indicated in Table 5.1.2, the following outfit shall be provided on board ships:

- fireman's outfits;
- fire hoses;
- dual-purpose fire nozzles;
portable air-foam nozzles, foam generators or combination foam units;
- international shore connections;
- complete sets of fire fighting tools;
- gas analyzers for flammable liquids and gases;
- induced-draught fans.

The number and composition of the additional fire fighting outfit and spare parts thereto shall be specified by the designer on agreement with the Customer.

2.13.13.2 Additional fire fighting outfit shall be kept in special storerooms. Part of the fire fighting outfit (hoses, hand nozzles, foam generators, air-foam nozzles, hose wrenches) may be placed at fire stations near each distribution valve manifold.

2.13.13.3 For charging cylinders of self-contained compressed air-operated breathing apparatus ships shall be provided with special compressors allowed for use by competent authorities.

The capacity and the number of simultaneously charged cylinders shall be specified by the customers. There must be at least four charged cylinders on board the ship.

In addition to the self-contained breathing apparatus of the above type, the Customer may require provision of the ship with breathing apparatus using other principles for protection of respiratory tract.

3 FIRE FIGHTING EQUIPMENT AND SYSTEMS

3.1 GENERAL REQUIREMENTS

3.1.1 General provisions.

3.1.1.1 The requirements of this Section are applicable to all fire fighting equipment and systems fitted in sea-going ships for the purpose of fire protection of the ship concerned.

Where provision is made in a ship for extra fire fighting systems in addition to those prescribed by this Section, such systems shall also comply with the requirements set out below, to an extent approved in each case by the Register.

Arrangement of fire fighting systems shall also be in accordance with the general provisions of Sections 2, 4, 5, Part VIII "Systems and Piping".

3.1.1.2 Fire fighting equipment and systems shall be so constructed that they will be efficient and readily available for operation under all conditions of service (see 2.3.1, Part VII "Machinery Installations").

3.1.1.3 Cylinders for storage of fire extinguishing medium, except for tanks for storage of foam-making compound, which are not under pressure, pressure tanks, carbon dioxide cylinders, compressed air bottles, nitrogen and halon containers used in fire fighting systems shall meet the requirements for pressure vessels and air bottles set forth in Part X "Boilers, Heat Exchangers and Pressure Vessels".

3.1.2 Fire extinguishing systems.

3.1.2.1 In addition to the water fire main system and in accordance with the purpose for which they are intended, all ship’s spaces shall be protected by one of the fixed fire extinguishing systems according to Table 3.1.2.1, unless expressly provided otherwise.

The use of a fire extinguishing medium which either by itself or under expected conditions of use gives off toxic gases in such quantities as to endanger the persons is not to be permitted.

The Register may consider the use of other equivalent systems.

3.1.2.2 Where two or more adjacent spaces presenting different degrees of fire hazard are not separated by gastight or watertight bulkheads or decks, or where oil fuel can flow from one space into another and the possibility of such flowing is not eliminated structurally, the choice of extinguishing medium and, consequently, of a fire extinguishing system shall be made to comply with the requirements for the fire protection of the space which affords the greatest fire hazard, and the calculation of the required amount of extinguishing medium and the rate of application shall be made on the basis of the total area or volume, respectively, of all spaces thus communicating.

Where the protected spaces are not adjacent, the calculation of the required quantity of a fire extinguishing medium is to be made for the largest protected space.

3.1.2.3 Watertight and gastight doors in the bulkhead separating adjacent machinery spaces may be considered as closures of openings in such bulkhead only where they are of a self-closing type or operated remotely and the fire extinction stations, from which the extinguishing medium may be discharged, are provided with the signalling of the fully closed doors. In the absence of such signalling, the calculation of the required amount and the rate of discharge of extinguishing medium shall be based on the requirement of providing for the total volume (area) of the adjacent spaces.

3.1.2.4 In multi-deck ships, one ’tweendeck is considered as separated from another ’tweendeck or hold by a gastight deck, provided the cargo hatchways, other hatchways and openings in this deck are

</table>

1 A sprinkler system is compulsory for passenger ships (see 4.2.1.2) and cargo ships only where Method IIC fire protection is applied. At the control stations - on the agreement with the Register.
2 For glass-reinforced plastic ships specified in 2.9 a carbon dioxide smothering system shall be used.
3 Lamp lockers, paint lockers and storerooms for flammable liquids, liquefied and compressed gases need not be fitted with a fixed fire extinguishing system, if the volume of each storage space is not more than 4 m³.
4 A system using medium expansion foam with expansion ratio of about 100:1 shall be used, except for the hangars for helicopters and enclosed garages where a system with foam expansion ratio about 1000:1 is to be employed.
5 Water screens are used in addition to the systems specified in cols 4, 7 and 10 in cases indicated in 2.1.2.8.
A foam smothering system shall not be used for the protection of cargo spaces of container ships.

A system using foam with expansion ratio of about 1000:1 shall be used.

In oil tankers and combination carriers of 20000 tons deadweight and upwards, as well as in ships on which tanks are cleaned by crude oil washing system.

Dry cargo spaces, subject to agreement with the Register need not be fitted with fire fighting systems (with issuance, therewith, of an Exemption Certificate in accordance with the Regulation II-2/53.1.3 of the Convention SOLAS-74 for ships covered by this Convention) in the following cases:

- in cargo ships of less than 2000 gross tonnage not having any ro-ro cargo spaces and not fitted for the carriage of dangerous goods;
- where the holds are intended only for the carriage of ore, coal, grain, green timber, non-combustible cargoes and cargoes of low fire risk. In this case, holds are to be fitted with steel hatch covers and effective means for closing ventilation terminals and other openings leading into the holds.

This exception shall not apply to passenger ships of 1000 gross tonnage and upwards.

Only in fish meal spaces. Other systems are not permitted for these purposes.

Holds and 'tween decks fitted for carriage of explosives, in addition to fire smothering systems shall be provided with water-spraying system (except goods of subclass 1.4 and compatibility group S (see also Table 2.8.2, item 7.3, note 1)). In the area of these holds the system shall be arranged by the ring circuit. Provision shall be made for free drainage of water from 'tween decks to holds.

Where the machinery space along with other steam driven machinery contains only one diesel-generator and one diesel-driven compressor, such space need not be fitted with a fixed fire extinction system on condition that the place where this machinery is located is enclosed by efficient arrangement preventing the oil fuel from spreading all over the space and provision is made for portable foam set to be available near these sets for fire extinguishing purposes.

Where an auxiliary oil-fired boiler or boilers as well as incinerators operating on fuel oil situated inside the machinery space is (are) not isolated from the rest of the space by gastight enclosure bulkheads and platforms, the machinery space shall be fitted with one of the above fire extinguishing systems, this system being capable of protecting the entire space, even where this machinery space does not contain any other oil-fired equipment or machinery, besides the above boilers.

Installation of one of the above systems is compulsory for all ships carrying flammable liquids and ships that serve them, all ships carrying readily flammable dry cargoes, irrespective of their gross tonnage, and for all other ships with a total power of main and auxiliary machinery more than 740 kW.

Required if the trunk is constructed of «A-Ö» class divisions without insulation. To be fitted outside the trunk.

This sprinkler system is compulsory on passenger ships carrying more than 36 passengers.

A warning notice shall be provided at the carbon dioxide smothering system controls stating that because of ignition hazard caused by electrostatic discharges the system must be used only for fire extinguishing but not for inerting purposes.

closed with watertight or gastight steel hatch closures and covers, while watertight stops are fitted where the deck is pierced in way of the framing. In the absence of such closures and stops, the spaces shall be considered as communicating, and the extinguishing medium calculation shall be made on the basis of the total volume of the spaces.

3.1.2.5 Where a space protected by means of carbon dioxide fire extinguishing system contains air reservoirs whose free air equivalent capacity is more than 30 per cent of the volume of the space (more than 10 per cent for Halon systems), the required quantity of extinguishing medium shall be calculated on the basis of the designed volume of the protected space plus the excess of the free volume of the compressed air. Such increase in the quantity of extinguishing medium need not be provided, if arrangements are made for discharging the compressed air outside the protected space, by means of relief valves and fuses provided on the air reservoirs.

3.1.2.6 In order to prevent excessive pressure in spaces protected by fire smothering systems, due to discharge of extinguishing medium, such spaces shall be fitted with breather valves, where necessary, or other available means (e.g. air pipes or ventilation ducts) shall be used.

3.1.2.7 Spaces for oil fuel units (see item 18 of Table 3.1.2.1) enclosed inside machinery spaces may have either an independent fire extinguishing system or they may be protected by the fire extinguishing system of the machinery space.

3.1.2.8 Whatever a fixed fire extinguishing system is specified in Table 3.1.2.1 for boiler spaces of oil tankers in which crude oil or clops are used for boilers, provision is to be made for 136 litres capacity foam extinguisher in compliance with 5.1.10 or an equivalent foam unit both equipped with fixed foam generators capable of delivering foam to the boiler fronts and to trap under burners, valves and connections. This fire extinguisher (unit) shall be remote operated from outside the boiler room.

3.1.2.9 The systems are to be so arranged as to provide the delivery of extinguishing medium to the entire space protected, including the enclosed portions thereof (e.g. control stations, workshops, etc. in machinery spaces).

3.1.2.10 The use of steam may be permitted by the Register depending on the particular case as an addition to the required fire-extinguishing medium; the boiler or boilers available for supplying steam shall have an evaporation of at least 1.0 kg of steam per hour for each 0.75 m² of the gross volume of the largest space so protected.

3.1.2.11 Where a gas other than carbon dioxide is used as a fire-extinguishing medium, it is to be a gaseous product of fuel combustion in which the content of oxygen, carbon monoxide corrosive elements and any solid combustible elements has been reduced to a permissible minimum.

Where such gas is used as the fire-extinguishing medium in a fixed fire-extinguishing system for the protection of machinery spaces, the system shall ensure protection equivalent to that provided by a fixed system using carbon dioxide as the medium (see also 3.9.1.1.1).

3.1.3 Arrangement and equipment of fire extinction stations.

3.1.3.1 Mechanical equipment, such as foam mixers, reservoirs, cylinders or vessels containing extinguishing medium or compressed air, inert gas generators, or high expansion foam generators, refrigerating plants, etc., as well as the starting controls of all fire extinguishing systems, except for the water fire main system, shall be arranged in fire extinction stations outside the protected spaces.

Where the operation of any fire extinguishing system, other than the water fire main system, involves the operation of the water fire pump or pumps, such pump or pumps shall be located outside the space or spaces protected; the operation of such pump or pumps shall be independent of the operation of equipment located in the space concerned.

3.1.3.2 Fire extinction stations shall comply with the following requirements:

.1 all fire extinction stations, other than those for machinery spaces, shall be positioned on the open decks or directly below them and shall have an independent means of access from the open deck. Fire extinction stations for machinery spaces may have no direct exit to the open deck only in case where provision is made for remote control of discharge of the extinguishing medium from the wheelhouse or another space provided with a direct exit to the open deck;

The means of controlling the fixed fire extinguishing system are to be readily accessible and are to be grouped in as few locations as possible at positions not likely to be cut off by a fire in the protected space;

.2 stations shall not be arranged forward of the collision bulkhead;

.3 fire extinction stations shall be bounded by steel tight bulkheads, decks or enclosures;

.4 the spaces housing stations shall be protected by heat insulation and shall be fitted with heating, if it is essential for normal operation of the station that positive temperature is maintained therein. The temperature in the spaces housing carbon dioxide extinction stations shall not exceed +45°C;

.5 air temperature in the station shall be controlled by means of thermometer so fitted therein as to be visible both from inside the station and, through a scuttle, from outside the station; in case of remote control of temperature limit the scuttle need not be required;
.6 fire extinction stations for cargo spaces shall be provided with telephone or other means of communication with the main control fire station and with the machinery space, if operation of the fire extinction station is dependent on the equipment located in the machinery space;

.7 entrance doors shall be opened outwards and kept permanently locked doors leading to a station located in a space specially provided for the purpose must be permanently locked, and one set of keys for the locks must be kept in a closed case with a glazed door located near the lock;

.8 all valves and other arrangements of the station shall be provided with nameplates identifying them with the spaces whose protection is controlled by the individual valves or arrangements. In addition, a schematic plan of the fire extinguishing system showing the controls and the spaces protected, as well as brief instructions for starting and operating the system shall be displayed in a conspicuous position within the station.

3.1.3.3 In ships of less than 150 gross tonnage where arranging a fire extinction station outside the protected space is hardly feasible, as well as in special cases in other ships under 500 gross tonnage where the volume of individual protected spaces does not exceed 100 cubic metres, reservoirs with fire extinguishing medium and pressure vessels may be fitted within a protected space on condition that such stations are provided with efficient remote control for immediately putting the system from outside the protected space; the remote starting control position shall be distinctly indicated and provided with lighting both from the general lighting and from the emergency lighting circuit.

3.1.4 Pipes and fittings.

3.1.4.1 Pipes shall be so laid as to comply with the following requirements:

.1 extinguishing medium shall be supplied to each protected space through a separate pipe line, with shut-off fittings provided thereon in the fire extinction station.

This requirement does not apply to the foam extinguishing systems intended to deliver foam from outside the cargo tanks by means of monitors and portable air-foam nozzles or foam generators producing average expansion foam;

.2 where a cargo space provided with the pipes of a fire smothering system is periodicaly used for accommodation of passengers or special personnel, an additional closing arrangement is to be fitted to the pipes which is to be located in the fire control station behind the fire extinguishing medium discharge valve for the space in question;

.3 laying the pipes of fire extinguishing systems through spaces containing oil fuel and lubricating oil shall not be permitted; pipes of fire extinguishing systems, except for gas smothering systems, shall not be laid through refrigerated spaces.

Where gas smothering pipes are laid through refrigerated spaces, they shall be fitted with efficient insulation and shall be provided with arrangements for condensate drainage;

.4 laying pipes of gas smothering systems through accommodation and service spaces, except for corridors, may be permitted only where such pipes have no detachable joints within said spaces and have been tested by a pressure required in the case of hydraulic tests of manifolds fitted in fire extinction stations.

Where such pipes are laid in the corridors, of accommodation and service spaces, detachable joints are permitted, but the number of such joints shall be minimized;

.5 all fire extinguishing systems shall be so designed as to permit of periodical checks for operation.

In the case of carbon dioxide smothering systems and halogenated hydrocarbon and dry powder systems, it is sufficient that compressed air is used, in lieu of an extinguishing medium, when testing the system for operation.

A non-return shut-off valve shall be fitted on the pipe line supplying compressed air to the manifold of the fire smothering station;

.6 gaskets used in the pipe joints of fire extinguishing systems shall be made of non-combustible materials resistant to the effect of the extinguishing medium, and marine environment.

3.1.4.2 Pipes shall be made of steel.

Copper, copper-and-nickel or other bimetallic pipes (one of the layers being steel or copper) may be used as equivalent to steel pipes.

Steel pipes shall have anti-corrosive coating both inside and outside.

The fittings of fire extinguishing systems, including sprinklers and sprayers, are to be made of materials resistant to the fire extinguishing medium and to marine environment.

3.1.5 Starting of systems.

3.1.5.1 A system shall be put into operation without any supplementary change-over at the station and shall operate quickly and efficiently under all service conditions, including those when the temperature is below zero and during a fire.

3.1.5.2 The possibility of spontaneous starting of a fire extinguishing system shall be excluded under any service conditions, including the effect of such factors as pitching and rolling, shaking and vibration.

3.1.5.3 Where necessary, the starting appliances shall be protected against mechanical damage.
3.1.5.4 Arrangements should be provided for the attachment of seals to the starting devices of the system.

3.1.5.5 Irrespective of the provision of remote starting control, the system shall be capable of being started directly at the fire extinction station, and the pump from the place of its installation.

3.1.5.6 Remote control system (by air, nitrogen, carbon dioxide, etc.) shall be provided with two cylinders, each being sufficient for one full operation of a fire extinguishing system.

3.1.5.7 Where provision is made for mechanical devices in the remote starting system, their valves should be controlled with the help of hand wheel or levers to be positively connected to the valve stems or spindles.

3.1.5.8 Automatic discharge of fire extinguishing medium is not permitted except for cases stipulated by 3.3, 3.6.3.

3.2 WATER FIRE MAIN SYSTEM

3.2.1 Number and capacity of fire pumps.

3.2.1.1 In ships other than those referred to in 3.2.1.6, provision is to be made for pumps, fire mains, hydrants and hoses complying as applicable with the requirements of this Chapter.

The number of fixed fire pumps and the minimum pressure at any hydrant when discharging water through hydrants at the rate of discharge determined by Formula (3.2.1.5) shall be not less than those specified in Table 3.2.1.1, the length of hoses complying with the requirements of 5.1.4, and the nozzle outlet diameters complying with 5.1.5.

For ships of restricted navigation areas, which are not engaged on international voyages (except for passenger ships) and have a gross tonnage under 2000, the requirement of Table 3.2.1.1 concerning the number of pumps may be waived subject to a special agreement with the Register.

*Note:* The number of pumps indicated above does not include the emergency fire pump, if fitted.

On floating cranes with a gross tonnage under 2000, one fire pump may be installed.

The pressure developed by the fire pumps shall be sufficient to ensure the operation of other fire extinguishing systems using water (e.g., for pressure water spraying, froth extinguishing, etc.) and supplied from the same fire pumps.

3.2.1.2 Passenger ships of less than 1000 gross tonnage and all other self-propelled ships of less than 2000 gross tonnage shall be provided with an independently driven, power-operated emergency fire pump of a capacity not less than 25 m³/h and with its source of power and sea connection located outside the machinery space in which the main fire pumps are installed (See also 3.2.4.2 and 3.2.5.8).

For self-propelled ships of less than 500 gross tonnage, except passenger ships, the provision of an emergency fire pump is subject to the special consideration of the Register. A motor pump complying with the requirements of 5.1.17 may be used as such a pump.

3.2.1.3 In cargo ships of 2000 gross tonnage and upwards if a fire in any one compartment could put all the fire pumps out of action there should be a fixed independently driven emergency fire pump complying with the requirements of 3.2.4.

3.2.1.4 An emergency fire pump need not be fitted, if the fire pumps and the associated sources of power are located in different compartments having not more than one adjacent steel deck or bulkhead so that in the event of fire in one compartment the pumps located in another compartment (other compartments) will ensure the supply of water to the fire main.

3.2.1.5 The total capacity of fixed fire pumps, except for an emergency pump, if any, with the pressure at any hydrant not less than that specified in Table 3.2.1.1, shall ensure discharge of water through hose nozzles in a quantity, in m³/h, not less than

\[ Q = km^2 \]  

(3.2.1.5)

where

\[ m = 1.68 \frac{L(B+D)}{L^2} \]

\[ L = \text{length of the ship (see 1.1.3 of Part IV "Stability"),} \]

\[ B = \text{moulded breadth, m;} \]

\[ D = \text{depth to the bulkhead deck amidships, m;} \]

\[ k = \text{coefficient equal to:} \]

0.016 for passenger ships having subdivision index R equal to, or more than, 0.5;

0.012 for passenger ships having subdivision index R less than 0.5;

0.008 for all other ships;

\[ R = \text{subdivision index determined in accordance with 2.3 of Part V "Subdivision".} \]

For catamarans and similar ships, the total capacity of fire pumps shall be determined as twice the capacity value for one hull.
3.2.1.6 The fixed water fire main system need not be installed in ships with the crew of less than 3 members.

3.2.1.7 In all ships other than passenger ships the total capacity of fire pumps need not exceed 180 m³/h, unless a larger capacity is required in order to ensure the simultaneous operation of other systems using water.

3.2.1.8 The capacity, pressure head and number of fire pumps for floating docks shall be chosen in accordance with the quantity of water required by the largest cargo ship which the dock can carry, for the operation of the water fire main system.

On non-self-contained floating docks receiving water for the water fire main system from the shore the emergency fire pump need not be installed.

3.2.1.9 When determining the total capacity of fire pumps, the capacity of fixed pumps fitted in the forward part of oil tankers, as well as the capacity of an emergency pump, shall not be taken into account.

3.2.1.10 Each fixed fire pump shall be capable of supplying at least two jets of water, with the largest nozzle size adopted in the given ship.

3.2.1.11 The capacity of each fixed pump, other than an emergency pump, shall not be less than 80 per cent of the total required capacity divided by the required number of fire pumps, but in any case not less than 25 m³/h.

3.2.1.12 If other fire extinguishing systems using water supplied by fixed fire pumps are provided in ships, the capacity of these pumps shall be sufficient for the operation of the water fire main system having the capacity not less than 50 per cent determined by Formula (3.2.1.5) and for parallel operation of one of the other systems requiring the largest quantity of water. In the case concerned the quantity of water for the water fire main shall be sufficient for delivering at least two jets of water through largest nozzles used in the ships, but more than six jets and more than 90 m³/h for cargo ships are not required. Possible increase of water discharge through each hydrant due to the pressure rise in the pipes required for the operation of the other fire extinguishing systems and also the requirements stated in 3.2.1.9 are to be taken into consideration.

The quantity of water for fire fighting systems, other than for the water fire main system, shall be determined in accordance with the requirements in 3.3.2.2, 3.4.2, 3.5.2 (within one main vertical zone), 3.6.5 and 3.7.

3.2.2 Location of fire pumps.

3.2.2.1 In passenger ships of 1000 gross tonnage and upwards, sea valves, fire pumps and associated sources of power shall be so located as to ensure that a fire in any one compartment will not render all pumps simultaneously inoperative.

3.2.2.2 In catamarans and similar ships, for which not less than two pumps are required in compliance with Table 3.2.1.1, it is recommended that one pump be fitted in each hull.

In this case, water supply be each pump to the water fire main of any hull of the ship shall be ensured.

3.2.3 Basic requirements for fire pumps.

3.2.3.1 In all self-propelled ships, fixed fire pumps shall generally have an independent mechanical drive.

In cargo ships between 300 and 1000 gross tonnage, one of the pumps shall have an independent drive.

In cargo ships of less than 300 gross tonnage with the main propulsion machinery of power output less than 220 kW and in passenger ships of less than 150 gross tonnage with the main propulsion machinery of power output less than 220 kW, as well as in dynamically supported craft the pumps driven from the main engine may be used provided that the propulsion unit (engine-shaft-propeller) is so designed as to permit of fire pump operation when the ship is not under way.

On agreement with the Register, a V-belt drive from the main engine to the pump may be permitted in above ships, provided that transmission of torque is ensured even when one of the belts is broken.

3.2.3.2 Fixed fire pumps including an emergency pump may be used for other board services, if the ship is provided with at least two independently driven pumps, one of which is at all times kept readily available for its direct purpose.

Where in conformity with Table 3.2.1.1 only one fire pump is fitted, it may be used for other purposes requiring short-time consumption of water (flushing out of decks, hawse pipes etc.).

No restrictions are placed on floating cranes.

A fire pump may be used for emergency drainage of machinery spaces.

3.2.3.3 In cargo ships of 500 gross tonnage and upwards bilge, ballast and flue gas scrubber cooling (see 3.9.3.1) pumps may be used as fixed fire pumps provided that they comply with the design requirements for capacity and pressure head and also meet the requirements of 3.2.3.2 and 3.2.3.4.

3.2.3.4 Pumps and piping intended for fire fighting purposes shall not be used for the pumping of oil and other flammable liquids, nor as ballast pumps for tanks used for alternate carriage of oil fuel and water ballast.

3.2.3.5 Fire pumps shall be fitted with a pressure gauge on the discharge side.

Pumps capable of developing in the fire main a pressure exceeding the permissible value shall be provided with relief valves set to operate at a pressure not more than 10 per cent in excess of the fire main working pressure, and having the pipes to discharge water into the suction main.
3.2.3.6 Fixed fire pumps and their sea valves shall be located below the light-draught waterline of the ship. A fixed emergency pump shall be installed in compliance with 3.2.4.

Fire pumps installed outside machinery spaces of category A shall have an independent sea valve in each compartment in which they are located.

3.2.3.7 All pumps, including the emergency pump, shall be placed in spaces with positive temperature.

3.2.3.8 In passenger ships of 1000 gross tonnage and upwards and in all passenger ships with periodically unattended machinery spaces containing fire pumps the water fire main system is to be permanently kept under pressure to provide for immediate operation of one of the hydrants located inside the spaces and is to be equipped with a pump automatically starting in case of pressure drop.

3.2.3.9 In cargo ships with a periodically unattended machinery space containing fire pumps or when only one person is required on watch provision is to be made for remote starting of one of the fire pumps from the navigating bridge and from the position where a permanent watch is provided when in port and for immediate water supply in the fire main without additional opening of the valves in the pump room. At the location of such arrangement a water pressure indicator shall be installed.

Where water fire main system is under pressure as required in 3.2.3.8, remote starting need not be provided.

3.2.4 Fixed emergency fire pump.

3.2.4.1 The emergency pump shall be driven by a compression ignition engine, gas turbine or an electric motor supplied with power from the emergency source of power.

3.2.4.2 The pump, its sources of power and sea valves shall be so located as not to be rendered inoperable by a fire within the spaces where the main fire pumps are located.

If it is impossible to install sea valve outside the machinery spaces, the power drive shall be provided to operate it from the location or starting position of the pump.

3.2.4.3 Where the pump is located above the lowest possible waterline, efficient arrangements shall be made for self-priming.

The total suction head and the net positive suction head shall be such that under all conditions of heel, trim, pitch and roll likely to be encountered in service, the requirements of 3.2.4.6 are met.

3.2.4.4 The boundaries of the space containing the fire pump should comply with the requirements of Tables 2.3.3-1 and 2.3.3-2 for control stations. The space containing the fire pump should not be contiguous to the boundaries of machinery spaces of category A or those spaces containing main fire pumps. Where this is not practicable, the common bulkhead between the two spaces should comply with the requirements of Table 2.3.3-1 for control stations.

No direct access should be permitted between the machinery space and the space containing the emergency fire pump and its source of power. When this is impracticable, an arrangement may be accepted where the access is by means of an air-lock, each of the doors being self-closing, or through a watertight door capable of being operated from a space remote from the machinery space and the space containing the emergency fire pump and unlikely to be cut off in the event of fire in those spaces. In such cases a second means of access to the space containing the emergency fire pump and its source of power should be provided.

No hold-back hooks are permitted for the above doors.

3.2.4.5 Where a diesel engine or gas turbine is used to drive the pump, a service fuel tank containing sufficient fuel to enable the pump to run for at least three hours is to be provided in the emergency fire pump room.

Sufficient reserves of fuel are to be available outside the machinery space containing main fire pumps to enable the pump to run for additional 15 hours. The pump engine is to be started manually or from such starting device as to enable the engine to be started at least 6 times within a period of 30 min, and at least twice within the first 10 min. Where the power output of the engine exceeds 15 kW, an independent starting device is to be provided.

3.2.4.6 The capacity of the emergency fire pump shall be sufficient for the simultaneous operation of at least two fire hose nozzles of the largest size adopted in the ship, at a pressure in compliance with the requirements of Table 3.2.1.1, and is to be not less than 40 per cent of the total capacity of the fire pumps and in any case not less than 25 m³/h.

3.2.4.7 Where the emergency pump is also intended to serve other water or froth fire extinguishing systems, its capacity shall be adequately increased to provide the simultaneous operation of any other systems requiring the greatest supply of water.

3.2.5 Piping.

3.2.5.1 The diameters of the fire main and water service pipes are to be sufficient for the effective distribution of the maximum required discharge from two fire pumps operating simultaneously. In cargo ships the diameter need only be sufficient for the discharge of 140 m³/h.

In ships of 500 gross tonnage and upwards and floating cranes (see 3.2.5.6) the pipes of the water fire main shall be rated at a working pressure of at least 1 MPa.

3.2.5.2 To prevent freezing, the pipelines of the water fire main system extended to open decks or
non-heated spaces shall be provided with shut-off fittings mounted in non-heated spaces, and with water drainage arrangements.

3.2.5.3 Each fire pump shall be fitted with shut-off valves on the suction and discharge pipes.

The use of slide valves on the suction pipe is permitted.

In ships of 500 gross tonnage and upwards the valves on the discharge side of the pumps are to be of a non-return shut-off type.

3.2.5.4 In oil tankers, the water fire main shall comply with the following supplementary requirements:

.1 on the main pipe where it is led out of the poop and in easily accessible places on the cargo oil tank deck, cut-off valves shall be fitted approximately in each 30 m of the open deck length. Each of such valves shall be provided with an information plate to indicate that the valve must be kept permanently open under normal service conditions;

.2 before each cut-off valve on the main there shall be fitted twin fire hydrants of 70 mm diameter so located that they are equally spaced, over the length of the ship and the fulfillment of the requirements of 3.2.6.2 is ensured;

.3 before the cut-off valve fitted in the poop there shall be a branch pipe on either side, led out from the water fire main to the forward part of the poop deck; the diameter of each branch pipe is to be sufficient for supplying water through two fire hoses connected to two hydrants fitted at the end of each branch; in ships of 1000 gross tonnage and upwards the diameter of each hydrant provided shall be about 70 mm, and in ships of less gross tonnage this diameter is to be about 50 mm.

Where fire pumps are fitted forward of the cargo tanks, two more similar pipes branching from the main of the same diameter as above shall be provided on the after part of the forecastle deck, a cut-off valve being fitted on the main within the erection, after the branches.

3.2.5.5 Where vehicles carried in railway ferries are arranged in four or more rows, the water fire piping shall be so fitted that hydrants of 70 mm diameter may be provided both on the sides of the ship and between the rows.

On catamarans and similar ships, each of the hulls is to be provided with a water fire main system including water hydrants, hoses and nozzles.

3.2.5.6 On all ships of 500 gross tonnage and upwards, and on floating cranes facilities shall be available on the open deck enabling an international shore connection to be used on either side of the ship (see 5.1.18).

3.2.5.7 Where two or more fire pumps are installed in passenger ships, the water fire main system shall be arranged in way of superstructures as a ring one with shut-off valves fitted to keep the system operable when certain sections of the ring main are disconnected, and it shall be laid not below the bulkhead deck.

3.2.5.8 Isolating valves to separate the section of the fire main within the machinery space containing the fire pump or pumps from the rest of the fire main is to be fitted in an easily accessible position outside the machinery space.

The fire main is to be so arranged that when the isolating valves are shut all the hydrants on the ship, except those referred to above, can be supplied with water by a fire pump not located in this machinery space through pipes which do not enter this space.

Short lengths of the emergency fire pump suction and discharge piping may be permitted to penetrate the machinery space if it is impracticable to route it externally provided that the integrity of the fire main is maintained by the closure of the piping in a substantial steel casing.

3.2.6 Fire hydrants.

3.2.6.1. Each fire hydrant shall have a shut-off valve and a standard quick-acting coupling. Hydrants fitted on open decks shall also have quick-acting plugs, or equivalent device.

3.2.6.2 The number and arrangement of fire hydrants shall ensure at least the delivery of two water jets from different hydrants, one of the jets being delivered through a hose of standard length as stipulated under 5.1.4.1, to any area of the ship which is generally accessible to passengers and crew during the voyage and to any part of any cargo space that is empty, ro-ro cargo space or special-category space. In the latter case, two jets shall be delivered to any part of the space through standard length hoses.

On open decks for containers two jets of water shall be delivered onto each accessible vertical side of the container by standard length hoses.

Where spaces in ships are separated by watertight or fire bulkheads bounding main vertical zones, the above requirements shall be complied with, even if the doors in the bulkheads are closed.

In a ship having a helicopter deck and hangar, the number and location of hydrants shall be such as to provide three jets of water for any part of the hangar and two jets — for any part of the deck.

3.2.6.3 The distance between fire hydrants is not to exceed 20 m in spaces and 40 m on weather decks.

3.2.6.4 Fire hydrants are not to be placed at the ends of dead-end corridors, in special electrical spaces or closed or rarely attended spaces.

3.2.6.5 In ships carrying deck cargo, fire hydrants shall be protected against damage from such cargo.

3.2.6.6 A fire hydrant shall be fitted on the discharge pipe, directly between each fire pump and shut-off valve.
3.2.6.7 In a machinery space of category A there shall be at least two fire hydrants located on both sides of the ship. In the case of ships of less than 500 gross tonnage, the hydrant fitted in immediate proximity to the fire pump may be used as one of the above hydrants.

In the machinery spaces of category A of ships of less than 150 gross tonnage, when there is a hydrant fitted in immediate proximity to the fire pumps, other hydrants may be omitted.

3.2.6.8 In all ships there shall be fitted a fire hydrant located in the forward part of the propeller shaft tunnels.

3.2.6.9 All fire hydrants shall be painted red.

3.2.6.10 In passenger ships two fire hydrants shall be provided in the shaft tunnel, being one of the means of escape, in the proximity to the machinery space of category A.

Where some other space is used as a means of escape, two fire hydrants shall be provided therein at the entrance to the machinery space of category A. Provision of 3.2.6.8 need not be met in this case.

3.3 SPRINKLER SYSTEM

3.3.1 General provisions.

3.3.1.1 The sprinkler system is to be of the wet pipe type but small exposed sections may be of the dry pipe type where in the opinion of the Register this is a necessary precaution. Any parts of the system which may be subjected to freezing temperature in service are to be suitably protected against freezing.

3.3.1.2 A sprinkler system shall be automatically set in operation at temperatures in the protected space rising to the values indicated in 3.3.4.2.

3.3.1.3 The water supply arrangements of every sprinkler system shall be fitted with a pressure tank, control valves, both automatically starting pump and air compressor with an air cylinder in order to maintain the working pressure in the system and ensure instantaneous delivery of water to the opened sprinklers.

3.3.1.4 The air cylinder, compressor, pump and the pipes of the sprinkler system, except for the piping connecting the sprinkler system to the water fire main system, shall be independent of all other systems.

3.3.1.5 A sprinkler pump and a pressure tank shall be arranged outside the protected space, at an adequate distance from the machinery spaces of category A. The main fire control station shall be provided with a pressure gauge.

3.3.1.6 In each individual case sprinkler systems whose rated parameters differ from those given in this Chapter are subject to special consideration by the Register.

3.3.2 Sprinkler pumps.

3.3.2.1 A pump shall be automatically brought into action by the pressure drop in the system and be capable of supplying water to the system before the standing fresh water charge in the pressure tank is completely exhausted.

Means are to be provided for testing the automatic operation of the pump on reduction of pressure in the system.

3.3.2.2 The pump and piping system shall be capable of maintaining the necessary pressure at the level of the highest sprinkler to ensure a continuous flow rate of water sufficient for the simultaneous coverage of the minimum floor area of 280 m² at the application rate specified in 3.3.4.1.

3.3.2.3 The pump shall be fitted on the delivery side with a test valve with a short open-ended discharge pipe. The effective area through the valve and pipe shall be adequate to permit the release of the required pump output while maintaining the pressure in the system specified in 3.3.2.2.

3.3.2.4 The pump is to have a sea inlet which is wherever possible to be in the space containing the pump.

3.3.2.5 Provision is to be made for connection of the main supply piping with the ship's fire main. A lockable non-return stop valve shall be fitted at the connection concerned.

3.3.2.6 There should be not less than two sources of power for the pumps. Where the sources of power for the pump are electrical, the pump drive should comply with the requirements of Section 19, Part XI "Electrical Equipment".

One of the sources of power for the pump may be an internal combustion engine which should be so situated that a fire in any protected space will not affect the air supply to the machinery.

3.3.3 Pressure tank.

3.3.3.1 The pressure tank shall be fitted with:

.1 an automatic pressure maintaining device;

.2 a water level control device and alarms warning of a drop of water level and pressure in the tank below the normal values and led to the permanent watch position in the machinery space of category A;

.3 a relief valve;

.4 a pressure gauge.

3.3.3.2 The pressure tank shall contain a standing charge of fresh water equivalent to the volume of water which would be discharged in one minute by the sprinkler pump.

The volume of the pressure tank shall be equal to at least twice that of the charge of water specified above.

---

1 See also IMO resolution A.800(19) "Revised Guidelines for Approval of Sprinkler Systems Equivalent to that Referred to in SOLAS Regulation II-2/12."
Arrangements shall be made for maintaining such air pressure in the tank as to ensure that where the standing charge of fresh water in the tank has been used the pressure in that tank is not less than a working pressure at the sprinkler plus a hydrostatic pressure from the tank bottom to the highest sprinkler.

Suitable means of replenishing the air under pressure and of replenishing the fresh water charge in the tank are to be provided. Means are to be also provided to prevent the passage of sea water into the tank.

3.3.3.3 Pneumatic pressure tanks shall comply with the requirements for pressure vessels set out in Part X "Boilers, Heat Exchangers and Pressure Vessels".

3.3.4 Sprinklers.

3.3.4.1 Sprinklers shall be placed in an overhead position and spaced in a suitable pattern to maintain an average application rate of not less than 5 l/min per 1 m² over the area of the protected space.

The Register may permit the use of other application rate depending on structural features of the protected space.

3.3.4.2 In accommodation and service spaces the sprinklers are to come into operation within the temperature range from 68 to 79°C, except that in locations such as drying rooms and galleys where high ambient temperatures might be expected, the operation temperature may be increased by not more than 30°C above the maximum deckhead temperature.

3.3.5 Control valves.

3.3.5.1 Control valves shall be fitted on the supply pipe of each section of the sprinkler system and shall ensure:

.1 delivery of water from the sources of water supply when any of the sprinklers fitted in the section comes into operation;

.2 giving of visual and audible alarm signal whenever any sprinkler comes into operation;

The signal shall be simultaneously produced both directly at the control valve, at the main fire control station and in the engine room compartment of permanent watchkeeping. It shall indicate the section containing the sprinkler which has opened. The alarm system is to be such as to indicate if any fault occurs in the system;

.3 the possibility of checking the operation of the system through a special test valve with the cross-section equal to that of the sprinkler.

The test valve for each section is to be situated near the stop valve for that section.

Means shall be provided to prevent the operation of the stop valves by any unauthorized person.

3.3.5.2 The control valves shall be fitted in special metallic enclosures or lockers outside the protected space.

Positions where control valves are fitted shall be easily accessible, illuminated and closed by a glazed door enabling the condition of all parts of the control valves and pressure gauge readings in particular to be watched.

A list or a plan shall be displayed at each control valve showing the spaces covered and location of the zone in respect of each section; also suitable instructions for testing and maintenance are to be available.

3.3.5.3 One of the control valves is to have a switch to enable the operation of alarms and indicators of each section of sprinklers to be tested.

3.3.6 Pipes.

3.3.6.1 Sprinkler system shall be subdivided into separate sections. Each section is permitted to contain not more than 200 sprinklers, a single section shall not be fitted in different main vertical zones. One section shall serve not more than two decks.

3.3.6.2 Provision shall be made in each section for purging the pipes with compressed air and flushing them with fresh water.

3.3.6.3 Each section of sprinklers shall be capable of being isolated by one stop valve only after which a gauge indicating the pressure in the system shall be provided.

The stop valve shall be fitted before the control valve and located together with it in metallic enclosures specified in 3.3.5.2.

The shut-off valve of each section shall be reading accessible, and the location shall be clearly and permanently marked. Measures shall be taken to preclude unauthorized persons from operating the shut-off valves.

3.3.6.4 The suction pipes of the pumps feeding a sprinkler system shall be fitted with filters to prevent the clogging of the system and sprinklers.

3.3.6.5 The diameters of the pipes of a sprinkler system shall be such as to ensure the operation of sprinklers at the water pressure and the rate of discharge specified in 3.3.2.2 and 3.3.4.1.

3.3.6.6 The pipe lines of the sprinkler system shall be fitted with non-return stop valves preventing sea water from penetrating into the pressure tank and the leakage of water from the tanks and the system.

3.4 PRESSURE WATER-SPRAYING SYSTEM

3.4.1 In passenger ships, as well as in machinery spaces of category A of other ships specified in 1.5.7 pressure water-spraying system shall be supplied from an independent pump which shall be automatically put into action by a pressure drop in the system and from the water fire main. A non-return stop valve shall be fitted on the connection line with
the water fire main.

In other protected spaces the system may be supplied only from the water fire main.

Where high-pressure water-spraying system is used, the necessity for the reserve supply for such system will be determined in each case on agreement with the Register.

3.4.2 The capacity of, and the pressure head developed by, the automatically starting pump shall be determined on the basis of characteristics and number of spray nozzles of an approved type fitted in the largest protected space and the rate of discharge which shall be not less than:

1. 5 l/min per 1 m² of the area over which oil fuel is likely to spread or cargo space area;
2. 1.5 l/min per 1m² of the largest horizontal cross-sectional area of the fish meal hold.

In cargo, working and special spaces, where the system may be divided into sections, the above pump shall be capable of supplying two sections of the total length of at least 40 m.

3.4.3 In passenger ships, as well as in machinery spaces of category A of other ships specified in 1.5.7 the pressure water-spraying system shall be kept charged under the required pressure up to the valves on the distribution pipes.

3.4.4 Filters preventing the system and spray nozzles from becoming clogged shall be fitted on the suction pipe of the pump supplying the system and on the connection pipe with the water fire main.

3.4.5 Distribution valves shall be placed in easily accessible positions outside the protected spaces.

Provision shall be made in the protected spaces, where people are permanently present, for remote control of distribution valves from these spaces.

3.4.6 Spray nozzles shall be placed in the protected spaces as follows:

1. underneath the ceiling of the space;
2. in casings of machinery spaces of category A;
3. above equipment and machinery using oil fuel or other flammable liquids;
4. above surfaces over which oil fuel or flammable liquids are likely to spread;
5. above stacks of fish meal bags.

The spray nozzles shall be so disposed in the protected space that the area covered by one nozzle will overlap that covered by adjacent nozzles.

3.4.7 Water supply is to be provided at the required pressure to all sections of the system in any compartment to be protected. The pump and its controls are to be installed outside the spaces to be protected.

The pump may be driven by independent internal combustion machinery which is to be so situated that a fire in the protected space will not affect the air supply to the machinery. If the pump is electrically driven from the emergency generator, the generator is to comply with the requirements of Section 9, Part XI "Electrical Equipment".

3.5 WATER-SCREEN SYSTEM

3.5.1 The present Rules provide for the use of the water-screen system in the following cases:

1. in special purpose ships where, subject to special agreement with the Register, water screens are permitted in lieu of "A" class divisions, in accordance with 2.2.1.2;
2. for protecting doorways in compliance with 2.1.3.7.

3.5.2 The water-screen system shall be fed from the water fire main. The design capacity of the pumps supplying the water-screen system shall be sufficient to provide at least 70 l/min per linear metre of the screen length.

3.5.3 Water screens for the protection of doorways shall be arranged and operated from the corridor.

3.6 DRENCHING SYSTEM

3.6.1 The present Rules provide for the use of the water drenching system in the following cases:

1. for drenching the racks of magazines (see 2.1.7.16 and Table 3.1.2.1);
2. for drenching the trunks of exits from machinery spaces (see 2.1.4.5);

3.6.2 The drenching system shall be fed from the water fire main. The pumps and associated sources of power shall be placed outside the space protected.

Water shall be supplied to the drenching system of exits from machinery spaces by means of a pump located outside the machinery spaces. It is recommended that additional water supply to the system shall be effected from sea water hydrophones.

3.6.3 The system shall be started from outside the space.

It is recommended that the system should be put into action at an inadmissible temperature rise in the space.

3.6.4 The drenching system of magazines and the pressure water-spraying system of the cargo spaces fitted for the carriage of explosives may be used for their flooding in emergency.

3.6.5 The capacity of the pumps supplying the system shall be sufficient to ensure the following rates of water discharge:

1. for drenching magazine racks, 24 l/min per 1 m² of the total magazine floor area;
2. for drenching the exits from machinery spaces, 30 l/min per linear metre of the horizontal perimeter.
of the surface to be drenched, where the vertical extent of surface does not exceed 5 m. Where the surface extends vertically more than 5 m, a tier of spray nozzles shall be fitted for each successive 5 m to deliver the above amount of water in addition to the quantity discharged through the lower tiers of spray nozzles.

3.7 FOAM FIRE EXTINGUISHING SYSTEM

3.7.1 General provisions.
3.7.1.1 The foam fire extinguishing system provides for the use as an extinguishing medium of mechanical foam of the following types depending on the foam expansion ratio:
low expansion ratio (about 10:1);
medium expansion ratio (between 50:1 and 150:1);
high expansion ratio (about 1000:1).

Foam fire extinguishing systems may include units separately producing, but simultaneously supplying low expansion ratio foam and medium expansion ratio foam (combination foam).

3.7.1.2 Use is to be made of foam concentrate types approved by the Register (see 1.3.3.1).

A foam concentrate for generating low-expansion and medium expansion foam is to be capable of being used both with fresh water and sea water.

3.7.1.3 The capacity of foam fire extinguishing systems and the quantity of a foam concentrate shall be calculated depending on the foam expansion ratio, the rate of application of solution and operation time of the system given in Table 3.7.1.3 and para 3.7.2.1.

3.7.1.4 Tanks for the storage of foam-generating liquid concentrate shall be fitted with arrangements for filling and draining, a device for watching the level of the liquid and a manhole for cleaning and inspecting. The tanks shall be of sufficient capacity to contain the full required amount of foam concentrate.

If no excessive pressure is required to be created in tanks during the system operation, non-return valves shall be fitted between such tanks and the fire main.

Where a foam concentrate using fresh water is utilized in the high expansion foam system, the flooding of a space protected shall be stored in a tank installed in the station. The remainder of the water may be supplied from ship’s storage tanks. Equipment (pumps, fittings, etc.) necessary for supplying fresh water to the tank shall be arranged outside the protected space, be fed from the emergency diesel-generator and have a capacity sufficient to ensure continuous operation of the system as required in Table 3.7.1.3.

3.7.1.5 The mixers for making aqueous solution of a foam concentrate of the required concentration shall be of an approved type. The mixers shall ensure operation of simultaneously used foam nozzles and/or foam generators.

3.7.1.6 The main system control station is to be located in the fire-fighting station outside the cargo spaces in the vicinity of accommodation and be easily accessible and ensure control of the system.

Besides, a pressure gauge is to be fitted on the pipe supplying water to the system at the foam extinction station.

3.7.1.7 Upon special agreement with Register the use of the deck main for the foam extinction and water fire systems is allowed.

3.7.2 Fixed deck systems.
3.7.2.1 The expansion ratio of the foam generated by the system is not generally to be greater than 12:1.
If the system generates actually low-expansion foam with expansion ratio slightly in excess of 12:1, the quantity of the foam solution is to be calculated as for the system with foam expansion ratio 12:1. Where the system generates the foam with expansion ratio somewhat below 12:1, the quantity of the foam solution is to be proportionally increased.

Where medium expansion ratio foam is used in oil tankers, the amount of the foam concentrate shall be not less than the rated quantity and sufficient for the operation of the rated number of the foam generators and one monitor during 10 min.

3.7.2.2 On oil tankers foam is to be supplied by means of monitors and foam applicators (see 5.1.6 and 5.1.19) to the entire cargo deck area and to any cargo tank whose deck was ruptured.

3.7.2.3 At least 50 per cent of the foam solution supply rate required in foot-holes 1.1 and 1.2 of Table 3.7.1.3 is to be delivered from each monitor.

On ships of less than 4000 tons deadweight only portable foam generators or hand applicators may be employed. However, in such a case the capacity of each generator or applicator according to 5.1.19 or applicator according to 5.1.6.1 is to be at least 25 per cent of the foam solution supply rate required in footnotes 1.1 and 1.2 of Table 3.7.1.3.

3.7.2.4 The number and position of monitors are to be such as to comply with 3.7.2.2, 3.7.2.6 and 3.7.2.8. The solution-delivering capacity of any monitor is not to be less than indicated is note 1.3 of Table 3.7.1.3.

3.7.2.5 It is recommended that a monitor should be provided with a changing-over device for alternate supply of water and foam. Pipes branching from the water fire main and foam solution supply piping shall be connected to the changing-over device.

In lieu of the changing-over device suitably interlocked shut-off valves may be fitted.

¹The rate of solution supply is not to be less than the greatest of the following:

1. 6 l/min per square metre of the horizontal sectional area of the single tank having the largest such area;
2. 0.6 l/min per square metre of cargo tanks deck area, where cargo tanks deck area means the maximum breadth of the ship multiplied by the total longitudinal extent of the cargo tank spaces;
3. 3 l/min per square metre of the area protected by the largest monitor, such area being entirely forward of the monitor but not less than 1250 l/min.

²For the area of the largest horizontal section of the largest protected space.

³Sufficient foam concentrate is to be supplied to ensure at least 20 minutes of foam generation in oil tankers fitted with an inert gas system and 30 minutes in oil tankers not fitted with an inert gas system using largest rate of solution supply stipulated in Note 1.

⁴Sufficient foam concentrate is to be supplied to ensure foam generation in the volume equal to 5-fold volume of the largest protected space.

⁵The rate of solution supply is to be sufficient for filling of the protected space volume during 15 minutes.

⁶For the area of the circle the diameter of which equals to the helicopter length with screw outreach taken into account.

⁷The solution supply rates apply to combination-foam production as well.
3.7.2.6 The distance from the monitor to the farthest extremity of the protected area forward of that monitor is to be not more than 75 per cent of the monitor throw in still air conditions.

3.7.2.7 The foam fire main in easily accessible places of the cargo deck shall be fitted with cut-off sluice or disc valves spaced 30 m apart. Next to each of such valves there shall be provided an information plate to indicate that the valve must be kept permanently open under normal service conditions.

Before each cut-off valve fitted on the foam piping there shall be twin fire hydrants, 70 mm in inside diameter, for coupling thereto fire hoses with air-foam nozzles located at such distance that the requirements of 3.2.6.2 are met.

Branches from the water fire main and foam piping to the monitors are also to be fitted before the cut-off valves.

Where medium-expansion foam is used, twin fire hydrants shall be supplied by valve chests with a number of fire hydrants equal to 50 per cent of the required number of foam generators.

3.7.2.8 In oil tanks, each foam fire extinction station shall be provided with a shut-off sluice or disc valve located on the foam fire main before it extends beyond the boundaries of the station.

Before the shut-off sluice or valve there shall be a branch led out to the forward part of the poop deck, both starboard and port, to monitors and twin fire hydrant, about 70 mm in inside diameter, for coupling thereto fire hoses with air-foam nozzles.

Where medium-expansion foam is used, twin fire hydrants shall be substituted by valve chests with a number of fire hydrants equal to 50 per cent of the required number of foam generators.

3.7.2.9 Foam smothering system for dry cargo spaces shall meet the following requirements:

1 A shut-off valve shall be fitted where the foam fire main is led out to the open deck.

2 Provision shall be made for valve chests with fire hydrants to be fitted on the foam fire main on both sides. The distance between the valve chests of either side shall not exceed 40 m. The number of fire hydrants in each valve chest shall be equal to 50 per cent of the required number of foam generators.

3.7.2.10 If a ship is provided with a fixed low- and/or medium-expansion foam system, there shall be provided branches from solution pipe line to entrances from the upper deck to machinery spaces as also to the oil fuel filling positions. Each branch shall be fitted with two hydrants for coupling thereto fire hoses with air-foam nozzles or foam generators.

3.7.2.11 In ships where medium-expansion mechanical foam is used, it is recommended that solution piping should be connected to water fire main to provide for the possibility of application of such foam for extinction of fires in accommodation and service spaces through the water fire main. For this purpose provision is to be made for an appropriate number of portable foam generators at hydrants in accommodation and service spaces.

3.7.2.12 The foam shall be supplied to the helicopter deck by monitors and hand applicators or by air-foam nozzles with the rate of supply specified in Table 3.7.1.3.

3.7.2.13 Instead of monitors and foam generators, permanent or portable combination foam units may be used respectively.

3.7.3 High-expansion foam system.

3.7.3.1 In spaces protected by a high-expansion foam system provision is to be made in the upper part, opposite to foam delivery, for openings to discharge air during foam supply. Such openings are to be generally arranged beyond positions 1 and 2 as stipulated in 7.1.4 of Part III "Equipment, Arrangements and Outfit". Where the outlets are otherwise arranged, they are to meet the requirements of Chapter 7.7 of the said Part.

3.7.3.2 The cross-sectional area of the foam ducts shall be not less than that of foam generator orifices. Foam pipes shall be so laid that the head loss therein is minimized and discharge orifices shall be so located that there are no obstructions for free foam discharge into the protected space.

3.7.3.3 A foam generator shall be of a design approved by the Register, ensuring the production of high-expansion mechanical foam from the aqueous solution of foam concentrate of an approved type.

3.7.3.4 A generator discharge orifice or foam duct at the place of its coming out beyond the station shall be provided with a closing device. This device shall open automatically concurrent with the foam discharge.

A manual control and position indicators "closed", "open"shall be provided.

3.7.3.5 To test a foam generator in operation, a special changing-over device shall be provided to discharge the foam to the open deck instead of the protected space. This device shall always be in a position to direct the foam discharge to the protected space and shall have an appliance for sealing in such position.

3.7.3.6 Where the area of the protected space is more than 400 m², at least two foam generators shall be provided to ensure foam discharge to the zones of the protected space, far distant from each other.

3.7.3.7 Equipment essential for the operation of the foam generators shall be supplied from the main and emergency sources of electrical power.
3.8 CARBON DIOXIDE SMOTHERING SYSTEM

3.8.1 General provisions.

3.8.1.1 The amount of carbon dioxide, in kg, shall be calculated from the formula

\[ G = 1.79V \varphi \]  \hspace{1cm} (3.8.1.1)

where 
- \( V \) = rated volume of the protected space, \( \text{m}^3 \);
- \( \varphi \) = factor equal to:
  - 0.3 for dry cargo holds and other spaces, except those indicated below;
  - 0.35 for machinery spaces, the rated volume of which is determined with regard to the full volume of casings;
  - 0.4 for machinery spaces, the rated volume of which is determined without any regard to the volume of casings from the level at which the horizontal area of the casings is equal to, or less than, 40 per cent of the machinery space area;
  - 0.45 for spaces in which motor vehicles with fuel in their tanks are carried and for closed ro-ro cargo spaces.

For machinery spaces such value of the factor \( \varphi \) is to be taken which results in a greater value \( G \).

In ships of less than 2000 tons gross tonnage, except for passenger ships, factors 0.35 and 0.4 may be reduced to 0.3 and 0.35, respectively.

3.8.1.2 Where a carbon dioxide smothering piping is used as a smoke detection one, the carbon dioxide distributing manifold may be placed together with the CO\(_2\) release controls for each space protected by the smoke detection system near its detecting units. However, it is recommended that the provision of such manifold should not preclude the possibility of discharging CO\(_2\) into any of the protected spaces directly from the fire extinction station.

3.8.1.3 The total cross-sectional area of manifolds and the cross-section of the distributing manifold shall be not more than the sum of the cross-sections of the cylinder valves simultaneously opening for the largest by volume protected space (for high-pressure systems) and not more than the cross-section of the tank discharge valve (for low-pressure systems).

3.8.1.4 The cross-sections of distributing pipes for individual protected spaces shall be not more than the sum of the cross-sections of cylinder discharge valves simultaneously opening for the space concerned (for high-pressure system) or not more than the cross-section of the tank discharge valve (for low-pressure systems). The sum of the cross-sections of the discharge pipes shall not exceed the cross-section of the supply pipe except where the calculated pressure drop in any pipe cross section is not less than 1 MPa.

3.8.1.5 The supply of carbon dioxide shall be ensured as follows:

1. 85% of the rated amount within not more than 2 minutes for machinery spaces, emergency diesel-generator and fire pump spaces and other spaces where oil fuel or other flammable liquids are used;

2. 2/3 of the rated amount within not more than 10 minutes for spaces for the carriage of vehicles with fuel in their tanks and spaces in which neither oil fuel nor other flammable liquids are carried or used.

3.8.1.6 The thickness of pipe walls shall be calculated in accordance with Ch. 2.3, Part VIII "Systems and Piping"; in this case, the design pressure \( p \) is assumed as equal to the design pressure of cylinders and tankers according to 3.8.2.1 and 3.8.3.1 and shall be not less than the values specified in Table 1.3.4.3 of the above Part.

3.8.1.7 Carbon dioxide shall be supplied to the protected spaces through nozzles arranged in the upper part of these spaces. Where the floor plates of the machinery spaces of category A are placed higher than one metre above the tank top, a number of nozzles (about 15 per cent of the total number) shall be fitted in the upper portion of the plate below the plate.

3.8.1.8 The total sectional area of the outlets of the nozzles of the space concerned shall not exceed 85 per cent of the total cross-section of the distributing piping.

3.8.1.9 Perforated pipes may be used instead of nozzles in silencers, exhaust-gas boilers and smoke stacks. The total area of pipe perforations shall be by 10 per cent less than the pipe cross-section.

3.8.1.10 In addition to the alarms required by 4.3.4, signal whistles operated by the released carbon dioxide pressure shall be fitted on pipes laid in the spaces listed in 4.3.1.

3.8.1.11 The sealing materials for the valves and flexible hoses should be usable at low temperatures down to \(-60^\circ\text{C}\).

3.8.2 High pressure system.

3.8.2.1 The number of cylinders for storing liquid carbon dioxide shall be provided depending on the filling ratio (amount of carbon dioxide per 1 litre of cylinder capacity) which is not to be more than 0.675 kg/l at the design cylinder pressure 12.5 MPa and over and not more than 0.75 kg/l at the cylinder design pressure 15 MPa and over.

When filling cylinders, deviation of not more than by \( \pm 0.5 \) kg from the rated amount per cylinder is permitted.

In cases specified in 3.1.3.3 and 3.8.5 the filling ratio shall be reduced by 0.075 kg/l against the above values.

3.8.2.2 The cylinders shall be placed vertically in rows on the pads which may be made of wood and shall be accessible for inspection and checking of the amount of carbon dioxide contained therein. Each cylinder shall be marked with its ordinal number.

Pilot cylinders shall be fitted in the fire extinguishing station and be coated with a distinguished paint.
3.8.2.3 A pipe connecting a cylinder with a manifold shall be seamless and made of red copper. Use of special flexible hoses made of approved materials is permitted.

A non-return valve shall be fitted on the pipe. The pipe is to be connected to the upper part of the manifold, the non-return valve is to be positioned either on the manifold inlet or so that accumulation of water above it is prevented. A drainage arrangement of the manifolds is to provide their complete draining.

3.8.2.4 A manifold of the carbon dioxide extinction station shall be fitted with a pressure gauge graduated to a value at least 1 MPa in excess of the hydraulic test pressure of the carbon dioxide cylinders. The value of the pressure gauge scale division shall not exceed 0.5 MPa.

3.8.2.5 A carbon dioxide extinction station shall have arrangements for weighing the cylinders or measuring the level of liquid therein.

3.8.2.6 Valves of cylinders.

.1 The valve shall have protective devices complying with the following requirements:

- protective diaphragms shall break at a pressure rise in the cylinders up to \((1.3 \pm 0.1) \rho\) MPa (where \(\rho\) is design pressure of the cylinder);

- for valves with slotted diaphragms which are additionally fitted with protective diaphragms the breaking pressure of slotted diaphragms shall be at least 1 MPa more than the highest value of the protective diaphragm breaking pressure;

- there shall be provided a checking device to indicate that the protective device has operated.

.2 The valve opening device shall be of the lever type and shall ensure the full opening of the valve by turning the lever to an angle not more than 90°. This device shall permit the valves to be opened individually or by groups.

.3 The cylinder valves shall be fitted with scarfed pipes cut short at 5-15 mm from the cylinder bottom; the inside diameter of the said valve pipes and of the pipes connecting the cylinder valves with a manifold shall be not less than 10 mm.

.4 If the design of the valves of pilot cylinders differs from that of the valves of all other cylinders, they shall be coated with a paint of another colour and have the inscription "starting".

3.8.2.7 The gas from the protective devices shall be discharged:

.1 to the atmosphere beyond the boundaries of the station through a separate pipe provided with an audible alarm at the outlet or

.2 to the distribution manifold where provision is to be made for:

- two pipes, one of which is open-ended and fitted with a shut-off valve, and the other is provided with a protective diaphragm;

- a signalling device to indicate the presence of pressure in the manifold whose readings are to be transmitted to the space where watch keepers are present all the time.

In this case, a checking device to indicate that the protective device has operated is not required for the valves.

3.8.3 Low-pressure system.

3.8.3.1 The rated amount of liquid carbon dioxide shall be stored in tank (tanks) at the working pressure of about 2 MPa which is ensured by maintaining a temperature of about –18°C.

A filling ratio of a tank shall be not more than 0.9 kg/l.

3.8.3.2 A tank shall be served by two self-contained refrigerating plants, each consisting of one compressor, a condenser and a cooling battery.

Each plant is to be capable of permanently maintaining prescribed temperature at its continuous operation during twenty four hours under environmental conditions specified in Ch. 2.3, Part VII "Machinery Installations".

When one of the plants is rendered inoperative, the other shall be automatically brought into operation.

One refrigerating plant may be used if it comprises two independently driven compressors and a condenser with 25 per cent heat transmission allowance.

Cooling batteries shall be separate for each plant or common, but they shall consist of not less than two isolated sections, each having a surface designed for full output.

In other respects, a refrigerating plant is to meet the requirements of Part XII "Refrigerating Plants" for unclassed plants, except for 3.3, 3.4, 3.5 and 6.2.6, as well as those of 2.1.1, 2.3.12, 2.3.13 and 7.2.2 for classed plants.

3.8.3.3 A tank shall be fitted with:

- branches with shut-off valves for filling the tank;
- a discharge pipe;
- a device for direct monitoring of liquid carbon dioxide level, mounted on the tank;
- two relief valves discharging to the atmosphere fitted on the permanent pipe connection of the tank with one of the relief valves:

- a pressure gauge;
- high and low pressure alarm devices;
- lowest acceptable level alarm device.

The setting of the relief valve shall be at least 1.1-1.2\(\rho\), and its throughput shall be such that pressure in the tank with the valve fully open may not exceed 1.35\(\rho\) (here \(\rho\) is working pressure in the tank, in MPa).

The value of the design pressure of the tank shall be assumed equal to the greatest lifting pressure of a relief valve.
3.8.3.4 If fitted outside the tank, the level gage pipe of the device for remote monitoring of the level of liquid is to be shut off with two valves (open throughout the period of operation) and provided with one control hydrant only, nominally filled (100%). The pipe and the control hydrant should be thermally insulated.

3.8.3.5 The pipe of the device for direct monitoring of level is to be shut off with two valves (closed throughout the period of operation) and provided with a control hydrant at least, filled to 95% of the nominal ratio, as well as with level monitoring hydrants to enable metering out when fire is extinguished in several spaces of different volume. The vertical length of the pipe by which level is gauged must bear no insulation.

3.8.3.6 The tank and pipes led therefrom and permanently filled with carbon dioxide are to be provided with heat insulation preventing operation of the relief valve within 24 hours after the installation is de-energized, at the ambient temperature of 45°C and initial pressure equal to the starting pressure of the refrigerating plant.

3.8.3.7 Material for a tank shall meet the requirements of 3.3, Part XIII "Materials". Welds shall be radiographed as required for class II in Table 3.3.2-2, Part XIV "Welding".

3.8.3.8 Pipe portion between two shut-off valves where liquid carbon dioxide is retained shall be provided with relief values beginning to operate at a pressure of 1.35p and a forced lifting device or drain values.

3.8.3.9 The alarm system shall give visual and audible alarm signals:

- when the maximum (not higher than the setting of the relief valve) and minimum (not less than 18 bar) pressure is reached in the tank;
- when the level of liquid carbon dioxide in the tank is reduced to the minimum acceptable level;
- in case of refrigerating plant failure;
- when the discharge of carbon dioxide begins.

The alarm signals are to be given at the main fire control station and in engineers' cabins.

3.8.4 Release control.

3.8.4.1 It is recommended that remote control of carbon dioxide discharge into the spaces specified in 3.8.1.5.1 should be provided from the main fire control station or from a position in the vicinity of the entrance to the space.

Release controls of the high pressure system at the fire extinguishing station shall ensure simultaneous opening of cylinder valves for the above spaces.

Two separate release controls should be provided for the system, one for cylinder release and the other to open the valve through which carbon dioxide would be discharged into the protected space.

3.8.4.2 At the position from which the system is remotely started, an alarm should be provided for gas discharge from its storage containers and for gas release into a protected space (for gas pressure in front of and after the starting shut-off valve).

Two separate controls should be provided for releasing carbon dioxide into the protected space and to ensure the activities of the alarm. One control should be used to discharge the gas from its storage containers. A second control should be used for opening the valve of the piping which conveys the gas into the protected space.

The two controls should be located inside a release box clearly identified for the particular space. If the box containing the controls is to be locked, a key to the box should be in a break-glass type enclosure conspicuously located adjacent to the box.

3.8.4.3 The pipes supplying carbon dioxide from pilot cylinders to servomotors shall be fitted with shut-off valves interlocked with a device opening pilot cylinders.

3.8.4.4 In low-pressure systems, release of carbon dioxide is to be manual. Where an automatic control system is provided to supply rated amount of carbon dioxide to protected spaces, manual regulation of gas supply shall also be provided.

Where the system serves more than one spaces, facilities shall be provided to control the amount of released carbon dioxide such as an automatic flowmeter or a precision level indicator located at the control station(s).

3.8.5 Local carbon dioxide fire extinction stations.

In well-founded cases local stations with not more than five cylinders (not more than 125 kg of carbon dioxide) may be permitted for certain protected spaces.

In a machinery space carbon dioxide cylinders may be placed for fire protection of crankcases and silencers of internal combustion engines, of smoke stacks and other enclosed compartments located within the machinery spaces.

3.9 INERT GAS SYSTEM

3.9.1 General provisions.

3.9.1.1 The inert gas system may be used:

- as a principal means of fire extinguishing in dry cargo holds, provided an independent inert gas generator is installed;
- as a means of warning the outbreak of a fire by rendering and maintaining the atmosphere of the cargo tanks non-flammable at all times, except when such tanks are required to be gas free.

3.9.1.2 The system is to be capable of:

- maintaining the atmosphere in any part of any
cargo tank with an oxygen content not exceeding 8 per cent by volume and at a positive pressure at all times in port and at sea except when it is necessary for such tank to be gas free; maintaining the atmosphere in any part of any dry cargo hold with an oxygen content not exceeding 14 per cent by volume;

.2 eliminating the need for air to enter a tank during normal operations except when it is necessary for such a tank to be gas free;

.3 purging empty cargo tanks with inert gas and air.

3.9.1.3 Inert gas with an oxygen content of not more than 5 per cent by volume is to be delivered to the cargo tanks.

3.9.1.4 The temperature of the inert gas supplied to the protected space is to be not in excess of:

.1 65°C for cargo tanks and

.2 50°C for dry cargo holds.

3.9.1.5 The inert gas supply may be treated flue gas from main or auxiliary boilers or separate gas generators. The Register may accept systems using flue gases from other sources or any combinations thereof provided an equivalent standard of safety is achieved. Each source of flue gas is to be provided with automatic combustion control to provide for the fulfilment of the requirement of 3.9.1.3.

In the systems using carbon dioxide measures are to be taken that the risk of ignition from generation of static electricity by the system itself is minimized.

3.9.2 Capacity.

3.9.2.1 The system is to be capable of delivering inert gas to the cargo tanks at a rate of at least 125 per cent of the maximum total capacity of the cargo pumps during discharging the ship.

3.9.3 Equipment.

3.9.3.1 A flue gas scrubber is to be fitted which will effectively cool the volume of gas and remove solids and sulphur combustion products. The cooling water is to be delivered by an independent pump. Provision is to be made for an alternative supply of cooling water from a stand-by pump without interfering with any essential services on the ship.

3.9.3.2 The gas scrubber is to be designed so that the capacity of the system will not drop for more than 3 per cent and the gas temperature at the outlet will not rise more than 3°C as against the design values under all normal conditions of heel and trim.

3.9.3.3 Provision is to be made in the gas scrubber housing for inspection holes and sight glasses made of impact-, and heat-resisting material for inspections and maintenance.

3.9.3.4 At least two blowers are to be fitted which together are capable of delivering at least the volume of gas required by 3.9.2.

3.9.3.5 Provision is to be made in the blower casing for maintenance devices.

3.9.3.6 Interior surfaces of the scrubber and blowers are to be made of corrosion-resistant materials or lined with a coating material.

3.9.3.7 Filters or equivalent devices are to be fitted to minimize the amount of water and solid particles carried over to the inert gas blowers.

3.9.4 Cargo tank protection against pressure (vacuum).

3.9.4.1 The inert gas system is to be so designed that the maximum pressure which it can exert on any cargo tank will not exceed the test pressure of any cargo tank.

3.9.4.2 One or more pressure-vacuum breaking devices are to be provided on the inert gas supply main provided they are not fitted on the gas venting system or individually on each tank. Control, location and design of these arrangements are to comply with Ch. 10.2, Part VIII "Systems and Piping".

3.9.4.3 A positive pressure not exceeding 21 kPa is to be maintained in the cargo tanks when they are filled or being filled with inert gas under normal working conditions.

3.9.5 Non-return valves.

3.9.5.1 At least two non-return devices are to be fitted in the inert gas supply main in the cargo area on deck. One of them is to be a deck water seal, and the other — a non-return valve or an equivalent device fitted forward of the deck water seal. They are to be located between the automatic valve required by 3.9.6.5 and the aftermost connection to any cargo tank or cargo pipeline.

3.9.5.2 The deck water seal is to be capable of being supplied by two separate pumps, each of which is to be capable of maintaining an adequate supply at all times and automatically starting each pump feeding the water seal and automatically filling the seal with water upon inert gas supply failure (for half-dry and dry water seals).

A drain pipe of the deck water seal is not to pass through machinery spaces. Discharge pipes are to be led directly overboard.

3.9.5.3 Provision is to be made to ensure that the water seal is protected against freezing in such a way that the integrity of seal is not impaired by overheating.

3.9.5.4 The deck water seal and all loop arrangements are to be capable of preventing return of hydrocarbon vapours at a pressure equal to the test pressure of the cargo tanks.

3.9.5.5 The non-return valve (see 3.9.5.1) is to be of the isolating type or a stop valve is to be fitted in the inert gas supply main forward of the non-return valve.

3.9.5.6 A water loop or other approved arrangement is to be fitted to each associated water supply and drain pipe and each venting or pressure-sensing
pipe leading to gas safe spaces. Means are to be provided to prevent such loops from being emptied by vacuum.

3.9.5.7 Provision is to be made in the deck water seal for sight holes and gauges for monitoring the water level and making inspections.

3.9.5.8 Materials used in non-return devices are to be resistant to the effect of acids generated during cooling, cleaning and by gases coming through the pipes.

3.9.6 Pipes.

3.9.6.1 The inert gas main may be divided into two or more branches forward of the non-return devices required by 3.9.5.1.

3.9.6.2 The inert gas supply mains are to be fitted with branch piping leading to each cargo tank. Branch piping for inert gas is to be fitted with either stop valves or equivalent means of control for isolating each tank.

Where stop valves are fitted, they are to be provided with locking arrangements to prevent the control of the valves by unauthorized persons.

The control system operated shall provide positive indication of the operational status of the stop valves.

3.9.6.3 In combination carriers the arrangement to isolate the inert gas system from the slop tanks is to consist of blank flanges.

3.9.6.4 Outlets of the pipes discharging inert gas into dry cargo holds are to be located in the lower part of the protected space. Such spaces of 500 m³ in volume and more are to be provided with two pipe outlets located in the opposite parts of the space. Pipe outlets discharging inert gas into the cargo tanks are to be located in the upper part.

3.9.6.5 A gas regulating valve is to be fitted in the inert gas supply main. It is to be capable of automatically regulating the flow of inert gas to the cargo tanks as referred to in 3.9.8.8 unless means are provided to automatically control the speed of the inert gas blowers.

3.9.6.6 If a connection is fitted between the inert gas supply main and the cargo piping system, arrangements are to be made to ensure an effective isolation having regard to the large pressure difference which may exist between the systems. This is to consist of two shut-off valves, the valve on the cargo main being of a non-return type, and an arrangement to vent the space between the valves in a safe manner or an arrangement consisting of a spool-piece with associated blanks.

3.9.6.7 The valve separating the inert gas supply main from the cargo main and which is on the cargo main side is to be a non-return shut-off valve.

3.9.6.8 Piping systems are to be so laid as to prevent the accumulation of cargo or water in the pipelines under all normal conditions.

3.9.6.9 Suitable arrangements are to be provided for the safe venting of the section of the line between the valves referred to in 3.9.5.5 and 3.9.6.5 in case when the first of these valves is closed.

3.9.6.10 The diameter of the pipes is to be such as to ensure the gas flow rate in any section of the piping to be not more than 40 m/s.

3.9.6.11 The piping from the gas scrubber to the blowers and recirculation lines as well as drain pipe of gas scrubbing and cooling system are to be lined with corrosion-resistant coating.

3.9.6.12 Suitable arrangements to be located after the valve referred to in 3.9.6.5 are to be provided to enable the inert gas main to be connected to an external supply of inert gas.

3.9.6.13 The inert gas supply main may be used for the venting of the cargo tanks.

3.9.7 Instruments and alarms.

3.9.7.1 On the discharge side of gas blowers, instruments should be provided for continuous indication of the inert gas temperature and pressure.

3.9.7.2 Instrumentation is to be fitted for continuously indicating and permanently recording, when the inert gas is being supplied:

1. the pressure of the inert gas supply main forward of the non-return devices required by 3.9.5.1;
2. the oxygen content of the inert gas in the inert gas supply main on the discharge side of the gas blowers.

These devices are to be placed in the cargo control room; but where no cargo control room is provided, they are to be placed in a position easily accessible to the officer in charge of cargo operations.

3.9.7.3 In addition to the requirements of 3.9.7.2, the following meters are to be fitted:

1. in the navigating bridge to indicate at all times the pressure (see 3.9.7.2.1) and the pressure in the slop tanks of combination carriers, wherever those tanks are isolated from the inert gas supply main, and
2. in the machinery control room or in the machinery space to indicate the oxygen content (see 3.9.7.2.2).

3.9.7.4 Suitable arrangements are to be provided on each cargo tank for measuring oxygen and hydrocarbon vapour concentration using portable instruments.

3.9.7.5 Suitable means are to be provided for the zero and span calibration of both fixed and portable gas concentration measurement instruments referred to in 3.9.7.2 and item 15 of Table 5.1.2.

3.9.7.6 Audible and visual alarms are to be provided to indicate:

1. low water pressure or low water flow rate to the flue gas scrubber;

---

1 Gas safe space is a space in which the entry of hydrocarbon gases would produce hazards with regard to flammability or toxicity.
.2 High water level in the scrubber;
.3 Increase of gas temperature, this alarm being operated when the temperatures referred to in 3.9.1.4 are reached;
.4 Failure of inert gas blowers;
.5 Oxygen content in the gas in excess of 8 per cent by volume in cargo tanks and more than 14 per cent by volume in cargo holds;
.6 Oxygen content in the inert gas main - more than 5 per cent by volume;
.7 Failure of the power supply to the automatic control system for the gas regulating valve and to the indicating devices referred to in 3.9.7.2;
.8 Low water level in the deck water seal referred to in 3.9.5.1;
.9 Gas pressure less than 1 kPa in the inert gas main. The alarm arrangement is to be such as to ensure that the pressure in slop tanks in combination carriers can be monitored at all times;
.10 High gas pressure (when the pressure reaches 10 kPa);
.11 Insufficient fuel feeding (if inert gas generators are available);
.12 Failure of power supply to the generator (if inert gas generators are available);
.13 Failure of power supply to automatic generator control system (if inert gas generators are available).

3.9.7.7 Indicating units of the alarms required in 3.9.7.6.3, 3.9.7.6.4 and 3.9.7.6.6, 3.9.7.9 are to be placed in the machinery space and in the cargo control room, where provided, but in any case they are to be placed in a position where the alarm may be immediately received by responsible members of the crew.

3.9.7.8 Audible and visual alarms indicating the low water level in the water seal of half-dry and dry type are to operate on failure of the inert gas supply.

3.9.7.9 Additional audible alarms independent of the alarms required in 3.9.7.6.6 or automatic shutdown of the cargo pumps is to be provided to operate when the pressure in the main drops to 0.5 kPa.

3.9.8 Systems using flue gas of boilers. (These requirements are additional to those stated in 3.9.1 to 3.9.7).

3.9.8.1 The flue gas scrubber and blowers are to be located aft of all cargo tanks, cargo pump rooms and cofferdams separating these spaces from machinery spaces of category A.

The design and location of scrubber and blowers with relevant piping and fittings are to prevent the gas leakages into enclosed spaces.

3.9.8.2 Suitable shut-off arrangements are to be provided on the suction and discharge connections of each blower. Arrangements are to be provided to enable the functioning of the inert gas plant to be stabilized before commencing cargo discharge.

3.9.8.3 Flue gas isolating valves are to be fitted in the inert gas supply mains between the boiler uptake and the flue gas scrubber. The valves are to be provided with an indicator to show whether they are open or shut. Precautions are to be taken to maintain them gastight and keep the seatings clear of soot.

Arrangements are to be provided to ensure that boiler soot blowers cannot be operated when the corresponding flue gas valve is open.

3.9.8.4 If the blowers are to be used for gas freeing, their air inlets are to be provided with blanking arrangements.

3.9.8.5 A flue gas isolating valve (see 3.9.8.3) is to be made of materials capable of withstanding the flue gas temperature and resistant to the corrosive action of the gas.

3.9.8.6 The piping between the flue gas isolating valve and the scrubber is to be made of corrosion-resistant steel.

3.9.8.7 An additional water seal or other effective means of preventing flue gas leakage is to be fitted between the flue gas isolating valves (see 3.9.8.3) and scrubber.

3.9.8.8 The valve referred to in 3.9.6.5 is to be located at the forward bulkhead of the forwardmost gas safe space through which the inert gas supply main passes.

3.9.8.9 Automatic shutdown of the inert gas blowers and gas regulating valve are to be arranged on predetermined limits being reached in respect of 3.9.7.6.1, 3.9.7.6.2 and 3.9.7.6.8. Automatic shutdown of the gas regulating valve is also to be arranged in case of blower failure.

3.9.9 Inert gas generator system (the requirements for this system stated below are additional to those given in 3.9.1 to 3.9.7).

3.9.9.1 For inert gas generator (the machinery including blower, combustion chamber, scrubber, oil fuel pump, burner, automatic combustion control and supervisory equipment) use is to be made of oil fuel meeting the requirements of 1.1.2 of Part VII "Machinery Installations".

3.9.9.2 The generators are to be located in the space referring to machinery spaces of category A.

3.9.9.3 In ships in whose tanks toxic substances may be carried the gas generators are not to be located in the machinery spaces and are to be located in a compartment reserved solely for their use according to the requirements of 3.9.8.1. Such a compartment is to be separated from the machinery spaces at least by a gastight steel bulkhead, having no doors or other openings, and from the accommodation spaces and cargo area by open decks, cofferdams or similar spaces. Adequate positive pressure type mechanical ventilation is to be provided for such a compartment. Access to such compartments is to be
only from an open deck outside the cargo area. Access is to be provided on the end bulkhead of the superstructure or deckhouse, not facing the cargo area and/or on the outboard side of the superstructure or deckhouse at a distance of at least \( L/25 \), but not less than 3 m from the end of the superstructure or deckhouse facing the cargo area.

The inert gas supply main is not to be located in, or have any connection with systems located in machinery spaces, accommodation spaces and service spaces.

3.9.9.4 Despite the provisions of 3.9.3.4, the Register may permit only one blower if it is capable of delivering to the protected cargo spaces the total volume of gas required by 3.9.2, provided sufficient spares for the air blower and its prime mover are carried on board to enable any failure of the air blower and its prime mover to be rectified by the ship’s crew.

3.9.9.5 Two oil fuel pumps are to be fitted to the inert gas generator. The Register may permit only one oil fuel pump, provided sufficient spares for the oil fuel pump and its prime mover are carried on board to enable any failure of the pump and its prime mover to be rectified by the ship’s crew.

3.9.9.6 Where more than one inert gas generator is provided, suitable shut-off arrangements are to be fitted on the discharge outlet of each generator plant.

3.9.9.7 Arrangements are to be made to vent the inert gas to the atmosphere during starting-up or in case of equipment failure.

3.9.9.8 Where the inert gas generator is served by positive displacement blowers, a pressure relief device is to be provided to prevent excess pressure being developed on the discharge side of the blower.

3.9.9.9 Audible and visual alarms are to be provided to indicate:

- .1 insufficient fuel oil supply;
- .2 failure of power supply to the generator;
- .3 failure of power supply to the automatic control system for the generator.

3.9.9.10 The gas regulating valve is to be automatically controlled to close and to interrupt the oil fuel supply to the generator on predetermined limits being reached in respect of 3.9.7.6.1 and 3.9.7.6.2.

Automatic shut-down of the gas regulating is also to be arranged in respect of 3.9.9.2.

3.9.10 System for the double hull and double bottom tanker

3.9.10.1 On tankers where the inert gas system is required, inertization of space in double hull may be accomplished through detachable branch pipes connected with the inert gas system of cargo tanks or via stationary pipelines.

3.9.10.2 If detachable branch pipes are used, connection arrangements on the system main shall be provided.

3.9.10.3 If stationary pipelines are used, a separate deck gate and non-retaining valve are to be provided.

3.9.11 Systems with inert gas supplied from cylinders.

3.9.11.1 The systems are designed for purposes stated under 3.9.1.1.2 in respect of fuel storage tanks mentioned in 2.1.11.

3.9.11.2 The cylinders of the systems, generally filled with nitrogen, and their spaces should comply with the requirements of 12.7.3, Part VIII "Systems and Piping" and 6.4.5, Part X "Boilers, Heat Exchangers and Pressure Vessels".

3.9.11.3 The system piping of Class I and Class II, respectively, should be tested on board in conformity with Section 20, Part VIII "Systems and Piping".

3.9.12 Nitrogen generator system

3.9.12.1 The present requirements cover the system in which the inert gas (nitrogen) originates at separation of compressed air to the basic gases while passing through the nitrogen generator (group of empty fibres of semipermeable membranes or through adsorbent placed in hermetic casing). The system shall also comply with requirements 3.9.2.1, 3.9.4, 3.9.6.1-3.9.6.3, 3.9.6.18 (applicable to 3.9.12.8), 3.9.7.4, 3.9.7.5, 3.9.7.9 (applicable to 3.9.12.14.7) and 3.9.8.8 (applicable to 3.9.12.8).

3.9.12.2 Air compressor and nitrogen generator shall be placed in the engine room or in a separate room which is then referred to other engine rooms (see 2.4.2 of this part). It shall locate outside the cargo area and it shall have no direct access to the accommodation, service rooms and control stations.

3.9.12.3 The system shall produce inert gas with at least 95% content of nitrogen and no more than 5% of oxygen. The system shall be fitted with an automatic device which would enable emission of gas into the air while preparation of the system for the specification level and even during its faults.

3.9.12.4 The system is to have air compressors of equal capacity. The system may have one compressor provided there are enough spare parts for it aboard to repair by the crew.

3.9.12.5 Equipment for processing of air ingoing into generator (aircooler, airheater, separator, filters) shall clean it from moisture, particles and oil and maintain specification temperature.

3.9.12.6 The nitrogen receiver may be installed in the cargo area. The room where it is installed shall have exit to the open deck, the door is to open outwards.

3.9.12.7 Tapping of air enriched with oxygen from the nitrogen generator and tapping of nitrogen from safety devices of the nitrogen receiver is to extend outside rooms to the places away from entrances, air intakes and openings of closed in spaces.
3.9.12.8 On the outlet from the nitrogen generator there shall be installed devices which maintain permanent pressure of the inert gas.

3.9.12.9 A flue gas isolating valve is to be installed between the nitrogen generator and receiver.

3.9.12.10 At least two return sealing arrangements are to be fitted in the inert gas system. One of them shall have double blocking and blow-off arrangement, another — the local locking device. They shall be installed on the main in the cargo area before branch pipes specified in 3.9.6.2.

3.9.12.11 There should be mounted instruments for the permanent temperature and pressure indication: on the compressor delivery side; on the intake side of the nitrogen generator.

3.9.12.12 There should be mounted instruments for the permanent temperature and pressure indication and registration during system operation:
   .1 oxygen content in the inert gas after the nitrogen generator;
   .2 pressure in the main before the return sealing valves required by 3.9.12.10.

3.9.12.13 Instruments required in 3.9.12.12 shall be fitted in the cargo operations control station and in the central control station (or in the engine room).

3.9.12.14 Audible and visual alarms are to be provided to indicate:
   .1 low air pressure in the compressor specified in 3.9.12.11.1;
   .2 high air temperature specified in 3.9.12.11.2;
   .3 high level of water in the separator specified in 3.9.12.5;
   .4 breakdown of electrical heater (if fitted) specified in 3.9.12.5;
   .5 high oxygen content specified in 3.9.12.3 and 3.9.12.12;
   .6 stop of energy supply of instruments specified in 3.9.12.12;
   .7 drop of gas pressure referred to in 3.9.12.12;
   .8 increase of gas pressure referred to in 3.9.12.12.

3.9.12.15 Automatic stop of compressor shall take place if alarm turns on as specified in 3.9.12.14.1 — 5 and 3.9.12.14.8. Automatic compressor protection is to comply with the requirements of Ch.4.5, Part XV "Automation".

3.9.12.16 Automatic locking of arrangements specified in 3.9.12.8 shall take place if power is disconnected from the compressor.

3.9.12.17 Alarm required by 3.9.12.14 is to be installed in the engine room and control station of cargo operations if such post is provided but in any case this should be such room where alarm might be immediately received by the responsible crew member.

3.10 DRY POWDER SYSTEM

3.10.1 General requirements.

3.10.1.1 An extinguishing powder approved by the Register for this purpose shall be used in the dry powder system.

3.10.1.2 Nitrogen or other inert gas approved by the Register for this purpose shall be used as a propellant gas.

3.10.1.3 The system shall consist of:
   - powder installations that contain dry powder containers, propellant gas cylinders and a distribution manifold;
   - hose stations;
   - pipes and fittings for bringing the system into action and powder supply to the hose stations.

3.10.1.4 Provision shall be made for a remote release of the system from any hose station.

The system shall be brought into action in not more than 30 s after the opening of the release cylinder at the remotest hose station operating from the powder installation concerned.

3.10.2 Quantity of dry powder and propellant gas. Capacity and number of nozzles.

3.10.2.1 A rated quantity of dry powder shall be stored in each container of the powder installation to provide a minimum 45 second continuous discharge time at rated consumption for all attached monitors and hand hose lines.

3.10.2.2 Each nozzle is to be capable of discharge at a rate not less than 3.5 kg/s, the powder throw range being not less than 8 m. In determining a maximum distance of coverage of each hand hose line the length of its hose is to be taken into account.

The capacity of each fixed monitor is to be at least 10 kg/s, maximum distance of coverage for monitors having a capacity 10, 25 and 45 kg/s shall be 10, 30 and 40 m, respectively.

3.10.2.3 The number of hand hose lines and monitors shall provide the delivery of the dry chemical powder to any part of the cargo tank deck and cargo piping from two hand hose lines or a combination monitor/hand hose line.

At least one hand hose line or monitor shall be located aft of the cargo area.

3.10.2.4 In gas carriers one monitor shall be provided in the cargo area to protect cargo manifold and capable of discharge locally and remotely.

3.10.2.5 The quantity of dry powder for the protection of spaces indicated in 1.5.1.2 and 1.5.3.2.2 shall be determined on the basis of 10 second operation of the system with a dry powder discharge rate 0.1 kg m\(^{-3}\) s\(^{-1}\).

3.10.2.6 The quantity of the propellant gas shall provide for a single entire release of the dry powder from the powder container.

3.10.3 Powder installations.

3.10.3.1 The powder installations shall be positioned aft of the cargo tank area. Where the length of
the cargo tank deck exceeds 150 m, one powder installation may be located thereon.

3.10.3.2 The dry powder system shall consist of at least two self-contained installations and in gas carriers with a cargo capacity of less than 1000 m³ only one such installation may be fitted.

3.10.3.3 Ships fitted with bow or stern cargo loading and discharge manifold shall be provided with an additional dry powder installation complete with at least one monitor and one hand hose line.

3.10.3.4 Where a fire extinguishing installation has two or more hose stations, an independent pipe with release valves is to ensure proper dry powder delivery from the manifold to each station. The powder installation shall provide for independent and simultaneous operation of all those stations.

3.10.4 Hose station.

3.10.4.1 Each hose station shall consist of remote-release cylinders with a non-kinkable hand hose line not more than 33 m in length or of a monitor.

3.10.4.2 All hose station equipment, other than a monitor, shall be stored in a watertight box or cabinet.

3.10.4.3 Each nozzle shall be fitted with an on/off operation and discharge device.

3.10.4.4 The cross-section of the nozzle shall be equal to that of the fire hose line or less than that by not more than 50 per cent.

3.10.4.5 Release cylinders shall be provided with pressure gauges.

3.10.4.6 Instructions on putting the system into action shall be available at the hose station.

3.10.5 Dry powder containers, pipes and fittings.

3.10.5.1 Provision shall be made in the container for a dry powder discharge pipe cut short at about 100 mm from the bottom.

3.10.5.2 A device is to be provided in the lower part of the container for gas flow into the container preventing the powder from flowing back into the gas pipe.

3.10.5.3 The filling ratio of the containers shall be taken equal to not more than 0.95.

3.10.5.4 Pipes and fittings shall have no contractions and abrupt expansions of cross-section.

3.10.5.5 The cross-sectional area of the manifold in the powder installation shall be not less than the total area of the pipes connected thereto for simultaneous discharge of dry powder or shall be not more than twice that area.

3.10.5.6 Provision shall be made on the distribution manifold for an arrangement for purging the pipes after use.

3.10.5.7 A bending radius of the dry powder pipe shall be not less than 10 pipe diameters.

3.10.5.8 The dry powder shall be discharged into the spaces indicated in 1.5.1.2 and 1.5.3.2.2 through nozzles. Their construction, arrangement and number shall provide for uniform spraying of powder in the entire volume of the space. The pressure at the remotest nozzle shall be taken at least equal to a minimum pressure necessary for effective spraying of powder.

3.11 TESTING OF FIRE EXTINGUISHING SYSTEMS

3.11.1 Fire extinguishing systems shall be tested in compliance with Table 3.11.1.

3.11.2 The operational testing of the systems is to be conducted in conformity with Register – approved programs to verify their serviceability, operation of release devices, and where prototype ships are concerned, to confirm the stipulated time for the fire-extinguishing medium discharge into the protected space.

On prototype ships, a test discharge of the rated amount of carbon dioxide into one of the protected spaces is required for high-pressure carbon-dioxide systems.

The test discharge may be omitted if reasonable substantiations are submitted to the Register.

4 FIRE DETECTION AND ALARM SYSTEMS

4.1 GENERAL REQUIREMENTS

4.1.1 All items of electrical equipment, devices, feeders and wiring of fire detection and alarm systems shall fully comply with 7.4, 7.5 of Part XI "Electrical Equipment".

4.1.2 The control panel should be located on the navigating bridge or in the main fire control station.

Indicating units should, as a minimum, denote the section a detector or manually operated call point has operated. At least one unit should be so located that it is easily accessible to responsible members of the crew at all times, when at sea or in port, except when the ship is out of service. One indicating unit should be located on the navigating bridge if the control panel is located in the main fire control station.

Passenger ships carrying more than 36 passengers should have the detection alarms for the systems required by 4.2.1.2 centralized in a continuously

**Notes:**
1. \( p \) is the maximum working pressure in the system, and for carbon dioxide \( p \) is a design pressure of a cylinder or a tank, MPa.
2. Fittings in assembly shall be tested for the tightness of closing by a pressure of at least 1.25\( p \), the valves of carbon dioxide cylinders — by the highest breaking pressure of protective diaphragms according to 3.8.2.6.1.
3. The systems shall be tested in assembly on board ship upon completion of all erection work.
4. Pipes specified in 3.1.1 and 3.2.1, after being tested by a pressure of 1.5\( p \), may be tested on board by an air pressure of 1\( p \).
5. Pipes of the water fire main system in ships of 500 gross tonnage and upwards (see 3.2.5.1) are to be tested by a pressure of at least 1.0 MPa.
manned central control station. In addition, controls for remote closing of the fire doors and shutting down the ventilation fans should be centralized in the same location. The ventilation fans should be capable of reactivation by the crew at the continuously manned control station. The control panels in the central control station should be capable of indicating open or closed position of fire doors, closed or off status of the detectors, alarms and fans.

4.1.3 Announcing an outbreak of fire to the crew, passengers, and special personnel shall be by means of the general alarm system, requirements for which are set out in 7.3 of Part XI "Electrical Equipment".

4.1.4 In the fire detection system alarms giving indication of fire and its location as well as of fault conditions in the detector circuits shall permit of readily indicating an area or a space from which a signal has come and a circuit where a fault occurred.

A signal received at the main fire control station shall be duplicated by an audible signal in the place where permanent watch, when in port, is provided.

In passenger ships visual signals shall be arranged on the mimic diagram. Audible signals shall be capable of being cut off. The circuit shall be so designed as upon receiving a second signal an audible signal previously cut off operates again.

4.1.5 The location of fire detectors shall meet the following requirements:

1. Where the fire detection system does not include means of remotely identifying each detector individually, no section covering more than one deck within accommodation, service and control stations should normally be permitted except a section which covers an enclosed stairway. If the detection system is fitted with remotely and individually identifiable fire detectors, the sections may cover several decks and serve any number of enclosed spaces;

2. In passenger ships, if there is no fire detection system capable of remotely and individually identifying each detector, a section of detectors should not serve spaces on both sides of the ship nor on more than one deck and neither should it be situated in more than one main vertical zone except that the Register, if it is satisfied that the protection of the ship against fire will not thereby be reduced, may permit such a section of detectors to serve both sides of the ship and more than one deck. In passenger ships fitted with individually identifiable fire detectors, a section may serve spaces on both sides of the ship and on several decks but may not be situated in more than one main vertical zone;

3. A section of detectors shall not contain more than 100 detectors and shall not cover more than 50 rooms;

4. A section of fire detectors which covers machinery spaces of category A is not to include fire detectors of control stations, accommodation spaces or service spaces;

5. In a cargo space, detectors must be connected to two sections at least.

4.1.6 Suitable instructions for testing and maintenance of the system shall be displayed adjacent to a fire alarm station.

4.1.7 Provision shall be made for automatically testing the correct operation of the automatic fire alarm and detection system.

4.2 FIRE DETECTION SYSTEMS

4.2.1 Automatic fire detection systems.

4.2.1.1 Automatic fire detection systems shall be provided in the following ships:

1. Passenger ships;

2. Cargo ships of 500 gross tonnage and upwards;

3. All ships with unattended machinery spaces of category A (see 4.2.3).

In the spaces protected by the sprinkler system an automatic fire alarm and fire detection system need not be provided.

4.2.1.2 In ships listed under 4.2.1.1.1 to 4.2.1.1.3, except those not containing any combustible medium, automatic fire detection system shall be provided in the following spaces:

1. All accommodation and service spaces except for sanitary spaces, saunas and provision stores;

2. Storerooms for explosives, storerooms for readily flammable materials, storerooms for combustible materials, welding workshops;

3. Control stations (other than main fire control stations, accumulator battery rooms and generator rooms);

4. Cargo spaces in passenger ships;

5. Cargo spaces of ships carrying dangerous goods other than bulk goods, including ships under 500 gross tonnage;

6. Special category spaces;

7. Closed ro-ro cargo spaces;

8. Closed cargo spaces other than those mentioned in subpara .6 and .7, which are intended for the carriage of motor vehicles with fuel in their tanks;

9. Corridors, stairways and means of escape in way of accommodation spaces in passenger ships carrying more than 36 passengers and in cargo ships where Methods IC and IIC of fire protection are used;

10. Incinerator room;

11. Zones presenting high fire risk (such as locations of oil purifiers, oil fuel pump units or their rooms, etc.) when said zones are so located that they
are not under continuous sight from the centralized control position in attended machinery spaces of category A.

12 spaces listed in 4.2.7, Part VII "Machinery Installations".

For cargo ships sub-paragraphs .1, .2 and .3 are to be met only when Method IIIC fire protection is used.

In passenger ships carrying not more than 36 passengers there shall be installed throughout each separate zone, whether vertical or horizontal, in all accommodation and service spaces and, where it is considered necessary by the Register, in control stations, except spaces which afford no substantial fire risk such as void spaces, sanitary spaces, etc., either:

- a fixed fire detection and fire alarm system so installed and arranged as to detect the presence of fire in such spaces; or

- an automatic sprinkler, fire detection and fire alarm system so installed and arranged as to protect such spaces and, in addition, a fixed fire detection and fire alarm system so installed and arranged as to provide smoke detection in corridors, stairways and escape routes within accommodation spaces.

Passenger ships carrying more than 36 passengers should be equipped with an automatic sprinkler, fire detection and fire alarm system in all service spaces, control stations and accommodation spaces, including corridors and stairways. Alternatively, control stations where water may cause damage to essential equipment may be fitted with an approved fixed fire extinguishing system of another type approved by the Register. A fixed fire detection and fire alarm system should be so installed and arranged as to provide smoke detection in service spaces, control stations and accommodation spaces, including corridors and stairways. Smoke detectors need not be fitted in private bathrooms and galleys. Spaces having little or no fire risk such as voids, public toilets and similar spaces need not be fitted with an automatic sprinkler system, or fixed fire detection and alarm system.

4.2.1.3 In the automatic fire detection and fire alarm system detectors are to be operated by heat, smoke or other factors approved by the Register. Flame detectors are only to be used in addition to smoke or heat detectors. Heat detectors are to be certified to operate within temperature limits of 54 to 78°C in the spaces with normal temperatures, and within temperature limits of 80 to 100°C in spaces with higher temperatures, such as certain areas in machinery spaces of category A, drying rooms, galleys, saunas, etc. when the temperature is raised to those limits at a rate less than 1°C per minute.

Heat detectors fitted in boiler air supply casing and uptakes are to operate at a temperature exceeding a maximum working temperature of flue gases by 100°C.

Heat detectors shall reliably operate at a temperature at least 5°C in excess of the temperature at which the sensor is set.

In spaces referred to in 4.2.1.2.9 smoke detectors are to be fitted operating before the smoke density exceeds 12.5 per cent obscuration per metre, but not until the smoke density exceeds 2 per cent obscuration per metre.

Smoke detectors fitted in machinery spaces of category A are to operate before smoke density reaches 50 per cent obscuration per metre.

Use may be made in machinery spaces of category A of the detectors which reveal a seat of fire on appearing temperature pulsation (heat-pulse detectors). The detectors are to be set to a temperature pulse frequency of 1.9 - 2.3 Hz and above and to operate when an amplitude is exceeded by (2±0.5)°C, whatever the room temperature may be.

The type of automatic detectors shall be so chosen that after the operation test they come back to normal operation without any components being replaced.

4.2.1.4 Detectors shall be so placed in the upper part of each protected space bounded by bulkheads, decks and enclosures that free flow of hot gases is ensured thereto. These detectors shall be protected against impacts and physical damage.

Detectors which are located on the overhead are to be a minimum distance of 0.5 m away from bulkheads. The maximum spacing of detectors is to be in accordance with Table 4.2.1.4.

<table>
<thead>
<tr>
<th>Type of detector</th>
<th>Maximum floor area per detector, m²</th>
<th>Maximum distance apart between centres, m</th>
<th>Maximum distance away from bulkheads, m</th>

<td>Smoke</td>
<td>74</td>
<td>11</td>
<td>5.5</td>
</tr>
</tbody>
</table>

The Register may permit departures from the requirements of Table 4.2.1.4 based upon test data agreed with the Register.

When heat-pulse detectors are used in machinery spaces, the deck area served by one detector is to be 50 m², and distance between centres is to be not more than 6 m.

4.2.1.5 In cargo spaces mentioned in subparas .4, .5, .8 an automatic smoke detection system may be applied which operates by air sample extraction from the space.

4.2.1.6 The automatic smoke detection system operating on the principle of air sampling from spaces shall comply with the following additional requirements:
.1 the system shall be capable of continuous operation at all times. Systems operating on a sequential scanning principle may be permitted on agreement with the Register;

.2 the sampling pipe arrangements shall be such that the location of the fire can be readily identified;

.3 the system shall be constructed and installed so as to prevent the leakage of any toxic or flammable substances or fire extinguishing media into any accommodation and service space, control station or machinery space;

.4 at least one smoke accumulator shall be located in every enclosed space for which smoke detection is required. However, where a space is designed to carry oil or refrigerated cargo, or other cargoes for which a smoke sampling system is required, means may be provided to isolate the smoke accumulators in such compartments on agreement with the Register;

.5 smoke accumulators shall be located for optimum performance and shall be spaced so that no part of the overhead deck area is more than 12 m measured horizontally from an accumulator. Where systems are used in spaces which may be mechanically ventilated, the position of the smoke accumulators shall be considered having regard to the effects of ventilation.

Smoke accumulators shall be positioned where impact or physical damage is unlikely to occur;

.6 not more than four accumulators shall be connected to each sampling point;

.7 smoke accumulators from more than one enclosed space shall not be connected to the same sampling point;

.8 sampling pipes shall be self-draining and protected from impact or damage from cargo working;

.9 the sensing unit shall operate before the smoke density within the sensing chamber exceeds 6.65% obscuration per metre;

.10 at least two sample extraction fans shall be provided.

The fans shall be of sufficient capacity to operate with the normal conditions of ventilation in the protected area;

.11 the fire alarm station shall have means permitting observation of smoke in the individual sampling pipe;

.12 means shall be provided to monitor the airflow through the sampling pipes so designed as to ensure equal quantities are extracted from each interconnected accumulator;

.13 sampling pipes shall be a minimum of 12 mm inside diameter. Where the pipes are used in conjunction with fixed gas fire-extinguishing systems, the minimum size of pipe shall be sufficient to permit the fire extinguishing medium to be discharged within the appropriate time;

.14 sampling pipes shall be provided with arrangement for periodically purging with compressed air;

.15 the control panel is to be located on the navigating bridge or in the main fire control station. Clear information is to be displayed on or adjacent to the control panel about the spaces covered.

4.2.1.7 Provision shall be made for checking the operation of detectors by means of devices supplying hot air of particular temperature or by using smoke or aerosol having the relevant range of density or particle sizes, or by applying other conditions inherent in a fire to which the automatic detector shall respond.

4.2.2 Manual alarms.

4.2.2.1 Manual fire alarms shall be provided in the ships which in compliance with 4.2.1.1 are equipped with automatic fire detection system.

4.2.2.2 In ships referred to in 4.2.2.1, the buttons of manual fire alarms shall be fitted in the following positions:

.1 in the corridors of accommodation, service and working spaces;

.2 in lobbies;

.3 in public spaces having an area of more than 150 m²;

.4 in machinery spaces of category A and in main control stations;

.5 in working spaces referred to in 1.5.8.1;

.6 in special category spaces;

.7 at exits from accommodation and machinery spaces to cargo spaces for motor vehicles with fuel in their tanks.

4.2.2.3 The buttons shall be placed in easily accessible positions and shall be readily noticeable. Within each main vertical fire zone in passenger ships there shall be at least one button on both sides on each deck, so that within the same main vertical fire zone the distance between buttons does not exceed 20 m.

In all other ships, there shall be one button within accommodation and service spaces on each deck, and if the length of the corridor exceeds 20 m, there shall be on each deck 2 buttons fitted in corridors on both sides of the ship and, as far as possible, in the opposite parts of the spaces.

In the accommodation and service spaces are arranged in various locations on the length of the ship, for instance, amidships and aft, the buttons shall be fitted in each of such locations, and on each of the decks, their number being as specified above.

4.2.2.4 The sections of automatic fire alarms may also be used for manual fire alarms.
4.2.2.5 All buttons of manual fire alarms shall be painted red and adequately illuminated both in normal and emergency conditions. The button shall be protected with glass.

4.2.2.6 Any required fixed fire detection and fire alarm system with manually operated call points shall be capable of immediate operation at all times.

4.2.3 Protection of unattended machinery spaces.

4.2.3.1 Unattended machinery spaces of category A, as well as heated air ducts and main boiler uptakes, essential auxiliary boilers with a steam capacity over 3 t/h and boilers with thermal liquids (including exhaust gas boilers) in such spaces are to be provided with an automatic fire alarm and fire detection system (see also 2.2.4, Part IX "Machinery").

4.2.3.2 In addition to the requirements of 4.2.1, a fire alarm and fire detection system of machinery space of category A shall meet the following requirements:

1. an indicating unit shall be fitted at the main fire control station, on the navigating bridge or another accessible place protected from fire in machinery space of category A;

2. a light signal shall indicate the location (zone) of fire;

3. a fire alarm shall give visual and audible alarm signals distinct from those given by any other system which shall be provided at the locations sufficient to be heard and observed by the watch officer on the navigating bridge and by the responsible operator;

4. in case of power supply failure or any fault in the system an audible alarm signal distinct from fire alarm shall be given in addition to a visual signal.

4.2.3.3 Type and location of detectors shall ensure rapid indication of fire and not permit of false operations under normal operating conditions of a machinery space. Provision shall be made for detectors of at least two types operating by different factors of fire detection.

In spaces of less than 2.5 m in height use of heat detectors only may be permitted on agreement with the Register.

4.2.3.4 The arrangement of detector sections shall provide for the indication of fire location. Air movement due to machinery operation shall not affect the efficient operation of the fire alarm and fire detection system.

4.2.3.5 Detectors with controlled sensitivity shall have holding devices and an indicator of the preset sensitivity.

4.2.3.6 Where provision is made for temporarily cutting off an individual detector or a section of detectors, this shall be clearly marked. When a preset period of time expires, a cut-off detector or a section of detectors shall automatically cut in.

4.2.3.7 Facilities shall be provided to release manually the fire alarm from the following places:

- corridors having entrances to machinery spaces of category A;
- wheelhouse;
- control station in the engine room.

4.3 FIRE WARNING ALARMS

4.3.1 Alarms intended to warn that fire extinguishing systems referred to in 3.8 are put into action shall be provided in the spaces permanently or periodically attended by people on their duties under normal service conditions, e.g. such as machinery spaces of category A and cargo spaces referred to in 15.4.3.1 except for small spaces where escape route to the door leading to the open deck does not exceed 10 m walking distance, the height of the ladder being not more than 2.5 m.

4.3.2 The signal warning of putting a total flooding system into action shall be given only within the space into which the extinguishing medium is to be discharged.

4.3.3 Control of fire warning alarms shall be interlocked both with the manual and the remote control of the system, no matter from which control position the system is started for operation. The warning signal shall be transmitted to the protected space so that people can leave the space before the fire extinguishing medium is discharged therein, and should sound during 20 s at least.

4.3.4 The signal shall be clear, distinct and readily audible in a noisy space, and shall be of a tone distinct from all other signals. In addition to the audible signal, there shall be a visible signal: "Gas! Go away!".

4.3.5 Audible alarm in the cargo pump room shall be:

- pneumatic, operated by dry and clean air or electrically-operated, intrinsically safe or electrically-operated, the electric actuating mechanism being located outside the pump room.
5 FIRE FIGHTING OUTFIT, SPARES AND TOOLS

5.1 FIRE FIGHTING OUTFIT

5.1.1 All items of the outfit shall be of a type approved by a competent state body and shall be ready for use at any time. Easy access to these items shall be provided.

5.1.2 Depending on the purpose and size of the ship the standards for supplying portable fire fighting appliances, apparatus and consumable materials shall be in compliance with Table 5.1.2.

The ships below are to be provided with extra items of outfit in addition to those mentioned in Table 5.1.2, as follows: ships carrying dangerous goods — in conformity with 2.8.8 and 2.8.9, oil recovery ships — in conformity with 2.11.18 - 2.11.20, ships with helicopter decks — in conformity with 2.1.11.7.

5.1.3 The couplings of all portable items of outfit (fire hoses, fire hose nozzles, portable foam generators, etc.) shall be of the standard quick-acting type and size adopted for the given ship. All couplings and items of outfit shall be made of a material resistant to marine environment.

In oil tankers and combination carriers couplings and items of outfit shall prevent spark formation.

5.1.4 Fire hoses shall comply with the following requirements:

1. They shall have a length of 15-20 m for hydrants fitted on the open decks, and 10-15 m for hydrants fitted within the spaces, as well as on the open decks of ships under 500 gross tonnage;
2. They shall be made of approved materials resistant to wear and destruction by microorganisms (rotting);
3. Fire hoses in assembly with nozzles shall be stowed at hydrants on reels or in baskets. On open decks they shall be kept in spray-proof ventilated lockers or enclosures. The lockers and enclosures shall be marked with letters "FH" (fire hydrant) painted red;
4. In interior locations in passenger ships carrying more than 36 passengers fire hoses shall be connected to the hydrants at all times.

5.1.5 Standard nozzle sizes shall be 12, 16 and 19 mm or close thereto. Nozzles sizes greater than 12 mm need not be used in accommodation, service and working spaces. In ships under 150 gross tonnage nozzles having 10 mm in diameter are permitted to be used. For machinery spaces and exterior locations, the nozzle size shall be such as to obtain maximum discharge possible from two jets at the pressure at each hydrant mentioned in Table 3.2.1.1 from the smallest pump, but nozzles sizes greater than 19 mm need not be used.

Nozzles are to be of an approved dual-purpose type with a shut-off device.

5.1.6 Air-foam nozzles for delivery of low-expansion foam (see 3.7) from fixed fire extinguishing system shall comply with the following requirements:

1. On cargo tank deck of oil tankers each nozzle shall be capable of delivering 4 m³/min of foam at a distance not less than 15 m (see also 3.7.2.3);
2. In ship’s spaces each nozzle shall be capable of delivering at least 2 m³/min of foam.

5.1.7 Foam extension pipes with a hook-shaped bell-mouth at the end (for low-expansion foam) and extension pipes fitted with light supports at the middle (for medium-expansion foam) shall be of about 4 m in length.

An extended air-foam nozzle having a hook-shaped bell-mouth may be used in addition to the usual air-foam nozzle instead of a foam extension pipe.

5.1.8 A portable foam set supplied from the water fire main system shall consist of:

1. An air-foam nozzle or foam generator delivering foam at a rate of at least 1.5 m³/min;
2. Two portable vessels with foam concentrate of not less than 20 litres capacity each;
3. Foam mixer (if air-foam nozzle or foam generator is not provided with an ejector);
4. A hose for connecting a vessel to the nozzle, foam generator or mixer.

Complete sets shall be located near the hydrants.

5.1.9 Portable fire extinguishers shall be of an approved type and shall comply with the following requirements:

1. No fire extinguishing medium should be used which, either by itself or under anticipated conditions of application, would give off toxic gases in amounts dangerous to human health;
2. Fire extinguishers shall have safety devices preventing the pressure therein to rise above permissible limits;
3. Every three fire extinguishers capable of being recharged on board ship shall be provided with two spare charges. The spare charges shall be kept where fireman’s outfit is stored;
4. For every ten fire extinguishers not capable of being recharged on board the ship one spare fire extinguisher shall be provided;
5. Fire extinguishers in special brackets of quick-detachable type shall be located in positions protected against direct sunrays and precipitation at a height of not more than 1.5 m as measured from the space floor to their handles and at a distance of at least 1.5 m from sources of heat;

</tbody>
</table>
| 4   | Foam fire extinguishers of at least 45 l capacity or at least 16 kg carbon dioxide or dry powder fire extinguishers (see 5.1.10 and 5.1.11) | 4.8 In accumulator battery rooms, other than those for radio stations and emergency lighting, 1 carbon dioxide fire extinguisher per space.  
4.9 In compartments for auxiliary machinery, 1 foam fire extinguisher, when the space area is 50 m² and more, otherwise the fire extinguisher placed near the entrance to such space may be sufficient.  
4.10 For oil fuel tanks, other than those of double bottom, not less than 2 foam fire extinguishers in each space adjacent to the walls or decks of the tanks. If such adjacent spaces are already provided with fire extinguishers, no additional fire extinguishers are required.  
4.11 In pump rooms, fuel distributing stations, petrol pipe line trunks, cargo hose spaces: 1 foam fire extinguisher for every 30 m² for floor area.  
4.12 In working spaces, 2 foam fire extinguishers, if the space area is under 100 m², plus 1 foam fire extinguisher for every 250 m² or part thereof, if the space area is more than 100 m².  
4.13 In welding shops and in storerooms for welding equipment, 1 foam fire extinguisher and one carbon dioxide fire extinguisher per space.  
4.14 In special category spaces, cargo spaces for motor vehicles with fuel in their tanks and in ro-ro cargo spaces on each deck, 1 fire extinguisher for each 20 m of deck length on both sides.  
At entrances to such spaces from accommodation and machinery spaces, 1 foam fire extinguisher.  
4.15 For helicopter decks, two carbon dioxide fire extinguishers.  
.1 In machinery spaces containing engines used as main engines or for other purposes with total power output of not less than 370 kW at least 1 fire extinguisher.  
For spaces containing steam engines or turbines fitted with a fixed fire extinguishing system fire extinguishers need not be provided.  
.2 In boiler rooms of cargo ships with domestic boilers of less than 175 kW, 1 fire extinguisher when the area of these rooms is not less than 25 m².  
.3 In the working spaces, referred to in 1.5.8.1 fire extinguisher mentioned in 5.1.11 for every 300 m² or part thereof, of each working space (bounded by watertight and gastight bulkheads).  
.4 In spaces containing electric generators or propulsion motors with the total power output being 1000-5000 kW, 1 fire extinguisher mentioned in 5.1.11 for each space.  
.5 In separate spaces containing electric switchboards if the switchboard length is more than 5 m and the space is not protected by means of a fire smothing system, 1 fire extinguisher mentioned in 5.1.11 for a space.  
.1 In boiler rooms, 1 fire extinguisher for a space. In this case, fire extinguishers specified in 5.2 of this Table are not required.  
.2 In hangars — 1 fire extinguisher for a hangar.  
.3 In spaces containing electric generators and propulsion motors with the total power output 5000 kW and over, 1 fire extinguisher mentioned in 5.1.11 for a space.  
Three fire extinguishers in accordance with item 5 of this Table may be used instead of one fire extinguisher prescribed by this item.  
.4 For helicopter deck, 1 carbon dioxide fire extinguisher.  
.5 For helicopter deck, dry powder fire extinguishers of a total capacity of not less than 100 kg.  
1 receptacle in each firing space in each boiler room with oil-fired boilers, and each space containing a part of the oil fuel unit, as well as near lamp and paint lockers, fuel filling and distributing positions and in other fire hazardous areas where oil fuel or other flammable liquids are liable to spread (except for machinery spaces). |

</table>

* In non-propelled oil tankers, the motor-pump shall be replaced by a portable hand pump of at least 6 m³/h capacity with a nozzle 10 mm in diameter and a nozzle pressure of at least 0.20 MPa. The pump shall be provided with two suction hoses, each 4 m long, fitted with a non-return valve, two delivery hoses, each 20 m long, and a hose nozzle of dual-purpose type with an outlet 10 mm in diameter.
.6 where several fire extinguishers are provided in the space in compliance with Table 5.1.2, some of them shall be located near the entrances, and the remainder shall be placed where a fire is most likely to break out within the space.

Where only one fire extinguisher is required for a particular space, it shall be located near the entrance to such space;

.7 the capacity of portable foam fire extinguishers shall be not less than 9 litres and not more than 13.5 litres and their total mass when charged shall not exceed 23 kg;

.8 where fire extinguishers containing other extinguishing media are used, they shall not be less effective than 9-litre foam fire extinguishers, whereas their overall dimensions and mass shall not exceed those of a 13.5-litre foam fire extinguisher.

Carbon dioxide extinguishers are to contain at least 3 kg of carbon dioxide.

In powder fire extinguishers the quantity of powder is not to be less than 4 kg. Fire extinguishers, items 4, 5 and 6 of Table 5.1.2, are to be selected with regard for the purpose of the powder extinguishing medium.

.9 in the machinery spaces fire extinguishers shall be so located that an extinguisher is not more than 10 m walking distance from any point in the space.

5.1.10 Foam fire extinguishers of at least 45 and 136 litres shall meet the following requirements:

.1 fire extinguishers shall be located within the protected space, in regular fixed places near the exits.

Only fresh water shall be used for charging the fire extinguishers;

.2 the air for an air-foam extinguisher shall be kept in a cylinder provided solely for that particular extinguisher. The quantity of air in the cylinder shall be at least 25 per cent in excess of the rated amount. The air cylinder shall be fitted with a pressure gauge;

.3 the delivery of foam from the fire extinguishers shall be through rubber-textile hoses wound on the reels of 10-15 m long. In order to increase the range of action for 136-litre fire extinguishers, fixed piping for attachment of hoses thereto may be laid, the total length of pipes and hoses not exceeding 30 m. In all cases, the location of fire extinguishers and the length of pipes and hoses shall be such that the foam may reach any part of the space.

5.1.11 Carbon dioxide or dry powder fire extinguishers of at least 16 and 45 kg shall meet the following requirements:

.1 carbon dioxide fire extinguishers shall not be used in spaces of such volume that the complete discharge of the carbon dioxide contained in the cylinders is liable to cause concentration of carbon dioxide in excess of 5 per cent;

.2 an extinguishing medium shall be delivered to any part of the protected space through fire hoses of 10-15 m in length and through pipes if necessary;

.3 fire extinguishers shall be placed near the exits in the spaces and shall be protected against mechanical damage.

5.1.12 Metal receptacles containing sand or dry sawdust impregnated with soda shall comply with the following requirements:

.1 the capacity of the receptacles should be at least 125 l;

.2 each receptacle shall be provided with a readily opening watertight cover, a scoop and a device for holding the cover in the open position.

5.1.13 Fire smothering blankets shall comply with the following requirements:

.1 they shall be sufficiently stout and durable;

.2 as a rule, they are to be made of non-combustible material; clean unraised thick felt may be used;

.3 blankets shall be stowed in special cases or lockers;

.4 they should have an area of at least 3 m² and be similar to a square or circle in shape.

5.1.14 Complete sets of fire fighting tools shall comply with the following requirements:

.1 one complete set shall include one fire axe and one light-weight fire crowbar;

.2 the sets of fire fighting tools shall be stowed on regular boards. The fastening of the tools shall permit of ready availability of the tools for use;

.3 in ships for the carriage of motor vehicles (other than diesel oil) in their tanks one set of tools shall be placed near the exits from the accommodation and machinery spaces to cargo spaces.

5.1.15 The fireman’s outfit shall include:

.1 personal outfit consisting of:

.1.1 protective clothing made of a material capable of protecting the fireman’s skin against the heat radiated by the fire, against burns and against scalding by steam; the outside surface shall be waterproof;

.1.2 boots and mittens of rubber or of some other dielectric material;

.1.3 a rigid helmet ensuring effective protection against impacts;

.1.4 a portable safe lantern with a minimum burning period of 3 hours; In ships carrying dangerous goods, in oil tankers and other ships having cargo spaces and spaces where a flammable gas, vapour or dust/air mixture is present or may arise, provision is to be made for explosion-proof lamps with explosion group 1Exd or 1Exp. The explosion group and temperature class are to be consistent with the category of the cargo carried. For example, they are 1Exd IIAT3 and 1Exp II2T3 for oil, kerosene and a number of gasolines.

.1.5 a fire axe with a helve made of hard wood; if the helve is made of some other material, it shall be insulated with some suitable dielectric material;
.2 a breathing apparatus consisting of:

- a smoke helmet or smoke mask which shall be provided with a suitable air pump and an air hose of a length sufficient to reach any part of the holds or machinery spaces through a hatch or doorway; the length of such air hose shall not exceed 36 m or a self-contained compressed air-operated breathing apparatus, the volume of air contained in the cylinders of which is to be at least 1200 litres, or other self-contained breathing apparatus which is to be capable of functioning for at least 30 min.

Each breathing apparatus shall be provided with a flexible fireproof lifeline, about 30 m in length. The lifeline shall be subjected to a test by statical load of 3,5 kN for 5 min. The lifeline shall be fastened directly to the apparatus or to a separate belt by means of a snap hook to preclude spontaneous separation of the line from the apparatus.

In ships where self-contained breathing apparatus are carried, provision shall be made for one complete spare charge or spare apparatus.

On passenger ships carrying more than 36 passengers, at least two sets of spare cylinders should be provided for each breathing apparatus, and all air cylinders are to be interchangeable.

Fireman’s outfits are to be stored in widely separated positions and to be easily accessible and ready for use.

In passenger ships at least two fireman’s outfits and one set of personal equipment are to be available at any one position. Within each main vertical zone, at least two sets of fireman’s outfits should be stored.

5.1.16 Portable electric drills shall be provided with an electric cable of sufficient length. The use of pneumatic drills instead of electric ones is permitted. The electric or pneumatic drills specified in item 11 of Table 5.1.2 may be reckoned in the number of the items prescribed for other types of ship’s outfit.

5.1.17 Portable fire motor-pumps shall comply with the following requirements:

.1 the pump shall ensure simultaneous operation of at least two fire hose nozzles with an outlet diameter of at least 12 mm at a head of 0,4-0,6 MPa and at vacuum in suction piping not less than 0,05 MPa; centrifugal pumps shall be fitted with a self-priming device;

.2 the pump motor shall be capable of being readily started either by hand or by special starters both at above-zero and below-zero ambient temperatures. The motor shall be provided with a quantity of fuel to ensure the operation of the pump for 1,5 hours without refuelling; the ship shall carry an additional reserve of fuel for refuelling;

.3 each motor-pump shall be provided with suction hoses, to a total length of 8 m, fitted with a suction strainer and a non-return valve, two delivery hoses, each 20 m long, two-dual purpose fire hose nozzles with an outlet diameter of at least 12 mm and a branch coupling for connecting two hoses;

.4 the dimensions and type of coupling for the delivery hoses and nozzles shall correspond to those used in the fixed water fire extinction systems fitted in the ship;

.5 the motor-pumps shall be provided with tools and accessories in compliance with the Manufacturer’s specification;

.6 motor-pumps for use in ships navigating under northern latitudes shall be placed in heated spaces, together with the suction and delivery hoses and nozzles.

5.1.18 The international shore connection (Fig. 5.1.18) for water supply from shore shall be in accordance with the following specification:

Outside diameter of flange — 178 mm;
inside diameter of flange — 64 mm;
bolt circle diameter — 132 mm;
holes — 4 equispaced holes 19 mm diameter equidistantly placed, slotted to the flange periphery;
flange thickness — at least 14,5 mm;
bolts — 4 pcs, each 16mm in diameter and 50 mm in length;
bolt nuts — 4 pcs, 16 mm in diameter;
washers for bolts — 8 pcs.

On one side the shore connection shall have a flat-faced flange with dimensions as above, and on the other a quick-acting coupling which shall correspond to the ship’s hydrants and hoses both in dimensions and design.

The shore connection, gasket, bolts and nuts shall be made of materials suitable for 1,0 MPa.

The shore connection complete with gasket, four bolts, four nuts and eight washers shall be stowed...
together with other items of fire fighting outfit in an easily accessible position.

5.1.19 Portable medium expansion mechanical foam generators and portable combination-foam production units shall comply with the following requirements:

1. Concentrate solution discharge at a pressure of 0.6 MPa, not less than 360 l/min (see also 3.7.2.2);
2. Foam jet range, at least 8 m;
3. Rated number of foam generators/units shall be determined from the formula

\[ N = \frac{Q}{q} \]  

(5.1.19.3)

where \( Q \) = solution capacity of the system, l/min;
\( q \) = solution capacity of a foam generator/unit, l/min.

50 per cent of the foam generators/units and extension pipes required by items 2.4 and 2.5 of Table 5.1.2 shall be placed in the poop, the remainder, in the forecastle and midship superstructure, if any.

5.1.20 For applicator shall consist of L-shaped pipe with long side of about 2 m fitted for connection to fire hoses and short side of about 0.25 m equipped with fixed nozzle for producing water for or fitted for connecting water-spraying nozzle.

These applicators shall be stored near the fire hydrants and those for breathing apparatus near the latter.

5.1.21 Fire buckets shall be provided with the hemp rope of sufficient length and shall be stowed on the open decks in easily accessible places. The buckets shall be painted red and bear inscription "fire".

5.2 SPARES AND TOOLS

5.2.1 A ship shall carry spares and tools, the number of which shall be not less than that specified in Table 5.2.1. The quantities prescribed in the Table apply to fixed fire extinguishing systems only.

In ships of less than 150 gross tonnage, as well as in ships and floating cranes of restricted area of navigation III provision shall be made for spare parts and tools specified in 1.1, 1.2, 1.5, 1.6, 1.7, 4.4 and 10.2 of Table 5.2.1.

5.2.2 The spares and tools for the systems shall be kept in the fire extinction stations.

The spares and tools for pumps, compressors and motors shall be kept in the vicinity of the corresponding machinery.

Spares shall be suitably marked.

| 7   | **2. parts for automatic control**  
     Halogenated carbon system:  
     .1 spray nozzles of each type and size fitted  
     .2 special wrenches for replacement of nozzles  
     .3 parts for safety and reducing valves (springs, disks, etc.)  
     .4 gauge glass to measure level of fluid in tank  
     .5 containers with Halon 1301, in assembly, arranged in compliance with 3.11.2.3 | In accordance with delivery specification  
     1 or 2 pcs  
     1 pc  
     1 set  
     1 pc for each 10 containers, spare parts referred to in 8.1, 8.2, 8.3 and 8.4 being not required |
| 8   | **2. parts for automatic control**  
     Dry powder system:  
     .1 parts of release arrangements for hand hose lines and monitors  
     .2 nozzles of each type and size  
     .3 wrenches for assembling and disassembling valves, hand hose lines, nozzles | 1 set of each  
     1-2 pcs  
     1 set |
| 9   | **2. parts for automatic control**  
     Miscellaneous items, for all systems:  
     .1 instruments and gauges:  
     .2 adequate quantity of packing material for onboard repairs  
     .3 fuses for automatic closing of fire doors and dampers  
     .4 spare parts for pumps, fans, compressors and engines serving fire extinguishing systems  
     .5 spare parts and tools for remote control equipment of fire extinguishing systems  
     .6 spare parts and tools for fire alarm systems  
     .7 flame arresters (inserts) of each type and size fitted  
     .8 spare parts for electrical equipment of fire extinguishing systems | 1 pc of each  
     1 set  
     In accordance with number of doors and dampers thus controlled  
     In accordance with Section 5 «Spare parts» of Part VII «Machinery Installations»  
     In accordance with delivery specification approved by the Register  
     In accordance with delivery specification approved by the Register  
     1-2 sets
